The reader naturally turns at the present conjuncture to the account of Tunis. In it we do not find any mention of the redoubtable Kroumirs; but there is a paragraph relating to the Khomair tribe, "the most warlike and the most inimical to strangers of any on the N. coast of Africa." Colonel Playfair is much less likely to make a mistake as to an Arabic name than are the French authorities, and no reasonable man can doubt the existence of the Khomairs, though few reasonable men believe in the existence of the Kroumirs. Of Biserta and its famous harbour we have a full account. It is situated only thirty-six miles from Tunis by land. The name seems to be a corruption of Iippo Zarytus, or Iippo Diarrhytus. It is not to be confounded with the other city of the same name, Iippo the Royal, now generally remembered as the bishopric of St. Augustine. The situation of the town is very picturesque, as it is built on each side of a canal which leads from the lake to the sea, with a European quarter adjoining on an island. The harbour or lake now called Tinja, formerly Hipponitus Sinus—Colonel Playfair says "Hipponitus Pallus" (*sic*)—might, in the hands of a European Power, "become one of the finest harbours and one of the most important strategical positions in the Mediterranean." The French are about to prove the truth of this opinion. The pursuit of an ardent "love of glory," so they have lately assured the world, has led them, of course without any of those vulgar commercial objects which England pursues, to annex this "finest harbour in the Mediterranean." Its length from east to west is about eight miles. Its breadth is about five. A small portion of the strait or canal which connects it with the sea is shallow; but a few days' labour only will be required to deepen it, and the greater part of the passage is as deep as the lake within—namely, from thirty to forty feet. "A comparatively small expenditure would be required to convert the lake into a perfectly land-locked harbour, containing fifty square miles of anchorage for the largest vessels afloat." It will be strange, indeed, if the "love of glory" does not induce the French to incur this expenditure, and thus, so to speak, mask Gibraltar, Ceuta, and Malta. Colonel Playfair hardly does justice to the beautiful scenery of this coast, as viewed from the sea. Travellers proceeding to the East by any of the ordinary routes enjoy the exquisite colouring of the mountains and headlands when the vessel passes near the shore more than any other part of the voyage up the Mediterranean. The numberless little islands, long forgotten, which dot the deep blue sea, all of which have their English nautical names, their modern Arabic names, and their ancient names, are situated in such deep water and among such favourable currents that some navigators prefer even to run a little out of the course in order to pass among them. Colonel Playfair hardly mentions the romantic island of Galita, now uninhabited, and omits Galitona altogether. He names the Fratelli, the "Dog Rocks" of the English sailor, and says that one of them exactly resembles a high-backed chair; but he might have noticed the interesting, if comparatively trivial, point that the other has a hole completely through it. Then there are Zembra and Zembretta, and Kameta, pierced with a natural arched canal, and a round dozen more, some of which are crowned with pirates' castles on lofty cliffs, and others are low and green, covered with soft grass, on which for centuries, perhaps, no civilized foot has trod. They are now, perhaps, to be trodden by the civilized foot of the French Zouave. More charming headquarters for a yachtsman it is impossible to conceive than might be made of, say, Galita. A hut to contain stores, and occasionally to afford shelter in bad weather, would enable an adventurous sailor to make a series of delightful excursions among the other islands and on the mainland. The ancient remains all along the coast and on along the coast of Tripoli are of surpassing interest to the historian and antiquary, and are, moreover, as picturesque as any an artist can find in the whole Mediterranean. Perhaps the French may be able to make Tunis as comfortable for English winter visitants as they have made Algiers, but we must hope they will be able to do it without imitating the Turks in their oppression of the natives. Full particulars of the excursions to be made in the country round Tunis are to be found in the Handbook.

A considerable part of Colonel Playfair's first division relates to the Greek islands. It is curious to compare his notes on the state of the people and their surroundings with those of older writers. Thus Tournesfort, who went through almost all the Archipelago, describes the Turks and their Government much as Colonel Playfair does, though there is an interval of one hundred and eighty years between the two travellers. There is the same peculation, the same dishonesty, the same carelessness of the future. In M. Tournesfort's day there was more cruelty. Impalements and the "gauche" are not commonly used now, except in places remote from Western influences. But the massacre of Scio took place not so very long ago; and the miserable state of Crete is at the

present day as nearly as possible what it was at the beginning of the last century. But the Greek islands seem little superior to the Turkish, except in a certain possibility of improvement, a promise unfulfilled, which is absent from everything Turkish. M. Tournesfort says of Argentières, or Kimolos, that "the women have no other employment but making love and cotton stockings." Colonel Playfair says of the neighbouring island of Thera, or Santorin, that "knitting stockings is one of the principal industries of the island." No doubt love-making flourishes there as well, though the modern author discreetly mentions the stockings only. Another quaint passage in Tournesfort relates to the volcanic rise of new islands, and this Santorin is still, as it was in his day, particularly celebrated for its "ups and downs" in the world. "What a fearful sight," he exclaims, "to see the teeming earth bring forth such unwieldy burdens! What a prodigious force must there needs be to move 'em, displace 'em, and lift 'em above the water." Of the port he says it is no wonder that it has no bottom, and adds, "I can't imagine whence it got the seeds of plants it was adorned with." Colonel Playfair's account is not so lively, but as a matter of fact it is curious to find him confirming Tournesfort's assertion that the harbour has no bottom. "The half-moon harbour . . . is the crater of an extinct volcano, and is in parts unfathomable." Shortly after Tournesfort's visit, namely, in 1707, a new island, Kaumene, rose to the surface; and from 1866 to 1870 a similar power was at work, adding to and altering the shape of the various islands and rocks which surround the harbour. The islanders must carry on their double occupation under difficulties. Even love-making can hardly thrive where "water and firewood are very scarce"; the unfortunate inhabitants, whom Colonel Playfair describes as an honest and industrious community, are obliged to obtain these commodities from Ios or Amorgos, yet they are passionately attached to their "lone volcanic isle." The neighbouring island of Naxos has an interest to the historian altogether apart from its connexion with the desertion of Ariadne—whom, by the way, Colonel Playfair never names—in the strange mediæval story of the Dukes of Naxos. "About 1204 it and several of the adjacent islands were seized by a Venetian adventurer named Marco Sanudo, who founded a powerful State under the title of the Duchy of Naxos. Favoured by Venice, his dynasty ruled over the greater part of the Cyclades for three hundred and sixty years, and finally succumbed to the Turks in 1566." Tournesfort tells us a little more than this. Marco Sanudo was a noble Venetian, and obtained his title of duke from the Emperor at Constantinople. The islands of the Duchy were partly dismembered among his posterity, Paros going to another family, who retained it till the Turkish invasion. But Naxos had twenty-one dukes before Crispo. Selim II. turned him out, when, as Tournesfort tells us, "he died of grief at Venice." When the Lusignans reigned in Cyprus, and the Veniers in Paros, and the Sanudos in Naxos, there must have been in the mere daily life of the islands materials for romances such as would furnish the world with a new Boccaccio or a new Chaucer. Some of these things are still on record for those who know where to look. Tournesfort says of Naxos and its dukes that "F. Sauger, a Jesuit missionary very much esteem'd in the Levant by the name of F. Robert, has happily cleared up the succession." Yachting under Colonel Playfair's guidance, pleasant as it will be, would have a large addition to its enjoyments if the romance of every islet were thoroughly set forth. But to have packed so much into so small a space, and to have made so few slips worse than a misprint in five hundred pages, chiefly consisting of names, dates, geographical and topographical figures, is enough to reflect credit on any author.

#### FOLK-LORE OF SCOTLAND.\*

THIS, the last contribution to the publications of the Folk-Lore Society, is a collection of all the popular superstitions, many of which are still current among the people of the north-east of Scotland. Mr. Gregor has obtained his knowledge of their "lore" by mixing with the "folk" himself, so that all that he has written down concerning them has been gathered either from his own experience or noted down from the lips of old people who could tell him of such customs of their youth as had been discarded by a younger generation. Fishermen and sailors, warlocks and witches, and all such animated depositories of legendary lore, have been his everyday acquaintances, until, as he himself says:—

The North, with its hills, and vales, and woods, and rocks, and streams, and lochs, and sea—with its fairies, and waterkelpies, and ghosts, and superstitions—with its dialect, and customs, and manners, has become part of myself. Everything is changing, and changing faster than ever. The scream of the railway whistle is scaring away the witch, and the fairy, and the waterkelpie, and the ghost. To give an account of the olden time in the North, as seen by myself and as related to me by the aged, is the task I have set before me.

Life in this same olden time must have been even more burdensome than we find it in these days of ours. Endless were the ceremonies that had to be gone through to ward off ill luck and to propitiate the unseen powers to send good luck to every undertaking that a human being could propose to himself from his cradle to his grave. We do not on examination find among these superstitious beliefs much that is peculiarly distinctive of the

\* Notes on the Folk-Lore of the North-East of Scotland. By the Rev. Walter Gregor, M.A. London: Folk-Lore Society. 1881.

district in which Mr. Gregor has collected them. They seem to be most, if not all, of them common to the whole of Scotland, while the dread of supernatural beings and belief in the powers of magic may be found in the tales of all nations. It seems strange that a people so practical as the Scotch should be so pre-eminently superstitious. But certain it is that many customs supposed to bring luck still linger among them, and their efficacy is largely believed in by the common people, although of course the strange rites and ceremonies of Halloween and Hogmanay night, as the last night of the year was called, have now degenerated into mere excuses for jollification, and are observed more in a spirit of sport than with any earnestness of intention. Yet the time is not long past when the powers of darkness were acknowledged as having more power on these two nights of the year than on any other, and were sought out and consulted in a spirit of awe and trembling that bore witness to the reality of the belief in their existence, and in their power to forecast the future fate of those who sought after them. In most cases these incantations were gone through with the object of finding out the future partner for life. And no doubt they frequently brought about their own fulfilment. For in a country neighbourhood where all the lads and lasses were known to each other, it would doubtless be very soon known to both the parties interested that fate had thus linked them together. Most of the rites peculiar to Halloween noted in Mr. Gregor's book are immortalized in Burns's poems. The credulity of those who practised them, with the deceptions to which they fell victims, give a fine subject for the poet's satire.

The chapter on Leechcraft contains some very astounding prescriptions. That they actually and frequently wrought cures affords additional testimony to the great effect that the mind has in healing actual bodily disease, if only the patient have full faith in the entire efficacy of the remedy. This healing power of faith, which doctors are day by day admitting more as a reality, throws light on the popularity of the miracle wells and healing shrines on the Continent, and forbids us to condemn as mere random lying the tales that are told of the astonishing cures effected by them. There are many such pilgrimage wells in Scotland cited by Mr. Gregor, although their healing efficacy was supposed to be an inherent virtue in the water, and not dependent on the favour of a saint. Some of these wells were surrounded by stones shaped like the several parts of the human body, called the "eye-stone," the "head-stone," and so on; and it was a necessary part of the treatment, after washing with water, to rub the part affected against the stone that bore the same form. This is the superstition of the Vei stone in the New Hebrides. Some offering was always left behind by those who tried the curing powers of the waters, even if it were only a rag from the patient's clothes. These tributes were hung up near the well, and every one abstained from disturbing them, as it was believed that whoever did so would get the disease that had been cured in the former patient. Just the same sort of thing was done as early as the time of the Romans. Votive offerings of hands, feet, almost every part of the body, have been excavated in the island sacred to Esculapius in the Tiber. The mode of cure in vogue then, however, was for the patient to go to sleep on the sacred spot, when it was revealed to him in a vision what he must do to ensure recovery. Among the cures for the whooping-cough, which are very numerous and improbable, we do not observe one which was in favour in some parts of Scotland. This was to sew a living caterpillar between two pieces of flannel, and wrap it round the patient's throat, leaving room for the animal to crawl round. By the time the grub died the whooping-cough was cured. Three roasted mice were an infallible cure for the whooping-cough. The same remedy is still much esteemed in Norfolk. There, however, swallowing one mouse is considered enough. The charming of warts is one of those perfectly unreasonable modes of cure that often prove efficacious when medical treatment fails. Dr. Carpenter cites as an instance of this strange truth the case of a girl who was cured of twelve warts by a friend who merely counted them, and then with an air of importance wrote the number down on a paper, assuring her that by Sunday they would all have disappeared. And so it proved. By the day named they were all gone, though the girl's father, himself a surgeon, had before tried to remove them with caustic and other applications in vain. If so very simple a prescription was enough to charm away a dozen of these unpleasant excrescences, we cannot wonder that the more elaborate forms of exorcism here enumerated should prove equally efficacious. In Switzerland the approved mode of charming a wart is to rub it with a snail and then put the snail on a thorn bush. Indeed, charm cures for other diseases are not by any means obsolete. In Yorkshire it is still believed that a set of mole's feet tied in a bag and worn round the neck keeps away cramp. And it is quite accepted as a fact by some persons that to carry a potato in the pocket secures immunity from rheumatism. These cures, like the miracle wells, prove the power that the will, if concentrated in sufficient force, has to cure any local affection of the body. The most remarkable case of this on record is the way in which the Prince of Orange cured the garrison of Breda of the scurvy by sending them a small phial of a decoction of camomile, wormwood, and camphor. It was diluted with a gallon of water to every three drops of the tincture, and served out as medicine to the sufferers, who from that day began to recover. Unfortunately the mind has even more power in inducing disease than in curing it. Hence the belief in witches' power of working ill, which disgraced the world so long, and in which Scotland had a melancholy pre-eminence. There, till quite

recently, every village had at least one old woman who was not "canny," whom it was well to keep on good terms with in case she should wish you some bodily ill. Mr. Gregor cites the case of a manse into which a tombstone had been built by the masons in revenge for the omission of the "fooin pint" at the laying of the foundation. This, it was believed, would make the house unhealthy, and the sad effect really followed. The ministers who lived there were very short-lived.

But, besides those superstitions common to all Scotland, there is one part of the book which can lay claim to a more special interest, as it refers to the beliefs current among the fisher part of the population, which seem to be peculiar to themselves. Fishermen and sailors are proverbially superstitious, and those of the east of Scotland are no exception to this general rule. Great ceremonies were observed at the launching of a new boat, and the greatest care had to be taken to avoid doing anything that might bring ill luck to the boat or the fishing. The boats were liable to be affected by an evil eye or an ill foot, like any land undertaking, but there were evil influences to be dreaded that were local in their application. For instance, it was believed to be unlucky to have a white stone among the ballast, but this was only in some villages. Great care had to be taken to avoid any one who was believed to have an "ill foot," and, if any one got this reputation, he was dreaded and shunned by all his neighbours. There is an amusing story told of two men in one village who both had the unenviable distinction of having an ill foot without being themselves conscious of it. They both set out one morning early to rouse the village for the fishing, and each meeting the other and knowing his ill repute, they both turned back, so that a fine morning's fishing was lost to the village. Indeed, there were so many untoward circumstances that might prevent the success of the fishing that it is quite a marvel how they ever contrived to catch any fish at all. When we read that a fisherman would have returned, under fear of being drowned, if any one asked him where he was going as he went down to his boat, one cannot but wonder how he ever contrived to elude that very natural inquiry. Odder still was the ban put on certain words, as will be seen from the following extracts:—

When at sea the words, "mini-ster," "kirk," "swine," "salmon," "trout," "dog," and certain family names, were never pronounced by the inhabitants of some of the villages, each village having an aversion to one or more of the words. When the word "kirk" had to be used, and there was often occasion to do so, from several of the churches being used as land-marks, the word "bell-hoose," or "bell-oose," was substituted. The minister was called "the man wi' the black quyte." A minister in a boat at sea was looked upon with much misgiving. He might be another Jonah. . . .

It was accounted unlucky to utter the word "sow" or "swine" or "pig," particularly during the time when the line was being baited; it was sure to be lost if any one was unwise enough to speak the banned word. In some of the villages on the coast of Fife, if the word is mentioned in the hearing of a fisherman, he cries out "Cold iron." Even in church the same words are uttered when the clergyman reads the miracle about the Gadarene swinery.

The word "hare" also might not be named at sea. In some cases superstition got the better of the greed of gain which commonly makes the Scotch snatch eagerly at any advantage, however petty; for a boat that had been wrecked, and lives lost in it, was allowed to go to pieces on the shore; not a stick of it would have been used, even for firewood, by any inmate of the village; though, if it were sold to some one from another place, the spell of ill luck was broken, and it might be mended and used without danger. We have not space to follow Mr. Gregor into each division of his subject. He has arranged his materials dictionary-wise under their several headings, so as to facilitate the search for information on any subject that comes within the range of his work. His book is a useful contribution to the works of the Folk-Lore Society, as he has thus saved from oblivion many curious customs and superstitions that have now passed out of use and ere long would have also passed out of mind.

#### AMONG THE HILLS.\*

IT is by no means an easy task to write a review of a work such as that before us, which, although it professes to be a story, and, in fact, presents itself to us in all the outward semblance of a two-volume novel, is really nothing more than a collection of sketches which, were it not for a certain connexion between them, would be best described as independent studies of character. For story, in the generally accepted sense of the word, there is none. A certain number of incidents are recorded which are, however, altogether subordinated to the development of the characters with whom they are connected, and are often left more or less incomplete. We are more than once led on to expect something in the nature of a *dénouement*, or something which shall serve as a key to some combination of circumstances that may develop into a story; but we are speedily undeceived and brought back to the contemplation of one or another of the characters with which the writer has, not without considerable pains, endeavoured to make us acquainted. In order, therefore, to accomplish anything like a review of the book, it becomes necessary to deal with each of these characters as a distinct and separate creation, and to dismiss from our mind any idea of story, plot, or "situation."

We are told in the opening pages that the heroine of the so-

\* *Among the Hills.* By E. Frances Poynter, Author of "My Little Lady," &c. 2 vols. London: Hurst & Blackett.

called story is one Hester or Hetty Adams, the orphan niece of Mrs. Adams, the dressmaker of the little village of Haysted. She is introduced to us in a somewhat apologetic manner as neither beautiful, intellectual, nor saint-like; and further acquaintance with her has certainly the effect of confirming the accuracy of this description. She is, in fact, afflicted by the physical deformity of a hump-back, and by general bad health; and her mind, as sagaciously observed by Mrs. Adams, is as crooked as her body. There certainly does not appear to be the making of a heroine about Hetty Adams, and had we not been otherwise informed, we should have been inclined to select for that distinction her cousin Jenny Adams, Mrs. Adams's own daughter. It may perhaps be convenient to explain at once that there are four principal characters in this village idyl, represented by Hetty and Jenny Adams on the one hand, and by David Griffiths, the village schoolmaster, and Richard Armstrong, a somewhat idealized watchmaker, on the other, the latter of whom, as Hetty is to be considered the heroine, must certainly be regarded as the hero of the drama. The other characters, one of whom, Reuben Frost, seems an attempt at a copy of Mr. Collins in *Pride and Prejudice*, are merely accessories, and require but little notice.

The story then, for such we must call it for the purposes of a review, opens with an introduction to the interior of Mrs. Adams's house, during the month of July. Mrs. Adams herself is a kind-hearted, matronly sort of person, with a tendency towards the enunciation of homely domestic platitudes, and a common-sense view of life which is often sorely tried by her niece Hetty's crooked disposition and unaccountable habits. Of Hetty herself we have said enough for the present, and it is a relief to turn to the contemplation of her cousin Jenny, a bright, good-looking, and lovable country girl, with a sweetness of disposition tempered only by an exaggerated development of her mother's common sense, which induces her to take a somewhat hard and fast view of life and its obligations that is not usually found in a young woman of her age. But there is a freshness and simplicity about her that quite compensates for any little severities of character; and she is, in fact, a very charming delineation of a modest village beauty. Of the two principal male characters, Richard Armstrong, the watchmaker, is a young man of twenty-five, and David Griffiths, the schoolmaster, a middle-aged man of forty-five or thereabouts. Armstrong lives in a cottage with his little niece Nessie, who is also more or less of a cripple; and Griffiths resides at the school-house with his sister, a sort of feminine edition of himself. Armstrong, it is hardly necessary to say, is soon discovered to be in love with Jenny, who in her modest and unaffected way is quite disposed to reciprocate his affection. Hetty, we are sorry to say, is without an admirer, though this was perhaps only to be expected. But her life, unenviable as it seems, is not without certain peculiar elements of interest; and her mind, crabbed and distorted by ill-health and brooding over her bodily infirmities, has sought refuge in a miserly accumulation of money, earned principally by fancy embroidery, executed late at night in the solitude of her own room, for which she finds a ready sale at the hands of a rich old lady in the neighbourhood, who is always ready to give her orders and pay her handsomely for her work. This money of Hetty's becomes, in fact, the turning-point of her life. She all of a sudden falls in love with Armstrong, having been touched and softened by some kind words addressed to her by him at a time when she felt she did not deserve them, having been found by him in the act of bullying poor little Nessie, the sight of whom, reminding her as it does of her own infirmities, has always hitherto engendered in her a feeling of anger and detestation. Now, however, she forces herself to be kind to Nessie for Armstrong's sake, and the two become great friends. Hetty lays herself out in every way to please and attract Armstrong, and soon succeeds in persuading herself that she has done so. Armstrong, who appears to be very fond of talking about himself, is to a certain extent attracted by her quickness and readiness of comprehension, but, of course, has not the remotest idea of making love to her. In the meantime, however, his real love affair with Jenny somehow hangs fire, causing a certain amount of gentle discomposure to that exemplary maiden, who moreover is not slow to notice the dead set made by her cousin at Armstrong. And the latter having said something to Hetty which is misconstrued by her vivid imagination into a direct confession of love, she is for a short time in the seventh heaven of happiness, and considers herself in the light of Armstrong's affianced bride. It has, in fact, been hinted to the reader that there is one slight obstacle to Armstrong's free action in love matters in the shape of an already existing wife, who has behaved badly and is living apart from him; and she presently appears upon the scene in person. But with an amount of consideration for her husband's interest that must be held to atone for much previous misconduct, she arrives at his house one night in a dying state, and before morning Armstrong is a free man. The circumstances of their married life have not been such as to call for any great display of emotion or regret on Armstrong's part; and he soon takes an opportunity of declaring his love for Jenny, in a manner, however, which we cannot but consider as somewhat pedantic and disappointing. By a combination of circumstances which, although carefully explained, we can hardly accept as possible in a little country village where every event of the slightest importance is known and discussed almost before it has happened, the fact of Armstrong being married and of his wife having returned to his house to die has not come under Hetty's cognizance; and almost at one and the same time she hears the news of this episode and of his pro-

posal to Jenny. She does not at first, however, display the emotion that such startling announcements might be expected to produce; and things go on much as usual for a few days. But the arrangements for the marriage of Armstrong and Jenny are retarded by the necessity of sending Nessie away to a certain watering-place recommended by a doctor as likely to restore the use of her limbs. This requires money, which Armstrong has not at present got; and everything appears likely to come to a standstill on this account, when Hetty, hearing the state of the case, resolves in a sudden inspiration of generous feeling to sacrifice her cherished savings for Nessie's benefit. So she carries the money off to Armstrong's house one evening, and with a few broken words of explanation, which, however, are sufficient to give him some idea of her feelings towards himself, places it at his disposal. He is completely taken aback; and, though of course most grateful to her, firmly refuses to accept it. He is at this moment called away on business, and Hetty hurries off, leaving the money behind her. But she has hardly reached home again before a reaction sets in. She begins to realize that she has lost her love, and given up her gold, and has nothing left in the world. The thought is maddening; and she determines to try and get her money back again. She knows that Armstrong is not at home, and she steals back to his house with the idea of recovering her beloved treasure. She finds the house empty, and the bag of sovereigns just where she had left it. But at this moment Armstrong returns, and she feels that she is detected. What happens to her afterwards readers may be allowed to discover for themselves.

It will be seen from the above outline that, as we have already intimated, *Among the Hills* is not by any means a story of thrilling interest. The writer has, in fact, sacrificed everything to the development of the leading characters, and in this respect the reader is bound to experience a certain sense of disappointment. Even when our interest begins to be awakened by something approaching a "situation," it soon fades away, and we find that a good opportunity is wasted in order either to make way for the display of some fresh idiosyncrasy on the part of the heroine, or to enable one or another of the male characters to indulge in some fresh dissertation on things in general. Even the final love scene between Jenny and Armstrong, where the way is cleverly enough prepared for what might be a pretty and effective picture, is rendered tame and uninteresting by the tiresome propensity of the swain to wander off into his eternal lucubrations about himself, his views, and prospects; and the whole thing becomes flat and spiritless. We are disposed to regret this all the more that the book displays throughout some descriptive power; and it might have been just as easy for the writer to have thrown some real interest into the story as to make it what it is, a mere medley of characters. Nor are these very characters by any means absolutely perfect; and they themselves suffer as much from being overdone as the story suffers from their undue prominence. Jenny Adams presents, as we have said, a pretty and charming study; and we feel sure that we have before us a picture drawn faithfully from real life. About Hetty we are not quite so certain. But in her anxiety to make her into a heroine the writer has gone too much into details, the result of which is that we are apt to get somewhat wearied of Hetty and her eccentricities; and the character would, we think, have been far more forcible if less elaborately worked up. On the whole, however, it is a clever sketch; and in criticizing it we are bound to take into consideration the difficulty of dealing successfully with a somewhat uninviting subject. We cannot consider the male characters equally successful. That of Armstrong appears to us unnatural, if not altogether inconsistent with his position in life, although we are told that he has received a good education, where and how is not recorded. His dialogues with David Griffiths are in fact more suggestive of the discussions one might expect to hear between a smart young undergraduate with a tendency to advanced ideas and a learned college don than of conversation between a well-educated mechanic and a village schoolmaster. As regards the schoolmaster, we should not wish to speak so decidedly, for he is evidently a man who has seen much of life; and he describes himself as having passed through phases that may be allowed to have had the effect of raising him to the intellectual position in which he is presented to us. As, however, we never quite get at the whole of his history, we can only sum him up as an interesting but somewhat unfinished character, and there leave him. As a story, *Among the Hills* can hardly be pronounced a success; but as a study of quiet village life, interspersed with decidedly good descriptive passages, it certainly deserves some praise.

#### AMERICAN LITERATURE.

MAJOR-GENERAL THOMAS (1) was one of the few Southern officers of the United States army who adhered to the Federal side in the great struggle between North and South. Thoroughly master of his profession, unflinching in his devotion to the cause he had deemed it his duty to embrace, his services in the war were of the greatest value and ultimately obtained the fullest recognition. He died in the summer of 1870, and now, in default of an abler biographer, Brigadier-General Johnson, who served under and with him thirteen years, pub-

(1) *Memoir of Major-General George H. Thomas*. By Richard W. Johnson, Brigadier-General U.S.A. Philadelphia: Lippincott & Co. London: Sampson Low & Co. 1881.

lishes this memoir, which is practically, so simple and uneventful was the remainder of the career of General Thomas, little more than a history of his campaigns in the Federal service, swollen by a mass of letters and speeches in which his contemporaries expressed, after his death, their opinion of his merits. Major-General Thomas was born in Southampton, County Virginia, on the 31st July, 1816. He went to West Point in 1836, and after completing his studies received in 1840 a commission as second lieutenant in the 3rd Regiment of Artillery. He distinguished himself in the war against the Floridan Indians and in the Mexican war, and was sent to West Point in 1851, being then Captain Thomas, as "Instructor in Artillery and Cavalry." In 1855 he was appointed Major of the 2nd Regiment of Cavalry, a regiment just organized under a recent Act of Congress, and here the more interesting portion of his career commences. The Colonel of the regiment was Sydney Albert Johnstone, and the Lieutenant-Colonel, Robert E. Lee. Of this period in his hero's career Brigadier Johnson tells us too little. There must surely be letters extant which would show what were the relations between Thomas and his superiors during the five years they were together, and it would be exceedingly interesting to know what the eminent men who were so soon to take divided courses thought and said at the commencement of the conflict. All we are told is that Lee, who was then Colonel of the regiment, General Johnstone being in command of California, was summoned from Texas, where the regiment was then stationed, to Washington in February 1861, by General Scott, Thomas being at that time on leave of absence. What remained of the regiment, Texas having joined the seceding States, reached New York in April 1861; Thomas was appointed on the 3rd of May Colonel, and in the course of the month joined General Patterson at Chambersburg, in Pennsylvania. Henceforward the story of General Thomas's life is a chapter in the history of the great war, which Brigadier Johnson tells at great length, with the aid of Thomas's official reports, but upon which we cannot follow him here. The conduct of General Thomas as a military commander is a question for soldiers by profession. There is, however, one incident—the crowning achievement of his career—which possesses general interest. Brigadier Johnson prints the telegraphic despatches in which Secretary Stanton and General Grant complain of what they call General Thomas's inaction and excessive caution in not attacking Hood at Nashville. The reply of General Thomas to these complaints and threats is a remarkable testimony to his ability and to the firmness of his character. Menaced with dismissal—twice at the instance of Grant, always careless about human life, and thinking only of his own particular operations, orders superseding him had been issued—he replied frankly that he was quite willing to resign his command, but that he could not attack until he was better prepared. Grant, finding out what sort of a man he had to deal with, gave up the idea of superseding him, and resolved to go himself to Nashville. Before, however, he started, he received intelligence of the crushing and complete victory Thomas had won. In a characteristic letter expressing his regret at being unable to assist at the unveiling of the statue of Thomas at Washington, General McClellan speaks of the "magnificent self-possession" with which General Thomas "disregarded the attempts of men ignorant of the circumstances or incapable of appreciating them to force him to give battle prematurely." Major-General Thomas was thanked by Congress for his services, and at the close of the war was appointed to the civil and military command of the States of Kentucky, Tennessee, Georgia, Alabama, and Mississippi. He seems to have discharged his difficult functions very successfully; but he was greatly annoyed, his biographer tells us, by attempts made to bring him forward as a candidate for the Presidency of the United States. General Johnson records a conversation with him, which is so characteristic of the man that it is worth quoting:—"I will have nothing to do with politics. I am a soldier, and I know my duty; as a politician I would be lost. No, sir; not even if I were elected unanimously would I accept. I want to die with a fair record, and this I will do if I keep out of the sea of politics and cling to my proper profession." The modesty and good sense of General Thomas were further shown in his refusal to accept the command of the army which President Johnson, who had had some misunderstanding with Grant, desired to confer upon him. Major-General Thomas died at San Francisco, where he was stationed in command of the Military Division of the Pacific, in May 1870. His death was sudden and premature, for his age was only fifty-three; but he died with the "fair record" to which he aspired.

Major Jones, who is United States Consul at Newcastle-upon-Tyne, prefaces his recollections of the army of the Potomac (2) with a "brief record" of the political struggle which ended in the election of Abraham Lincoln as President of the United States; a struggle in which, although he had not attained "the required age of citizenship," the author took, he tells us, an active part. Other chapters on slavery and emancipation, war and credit, serve the same purpose of needlessly increasing the size of a book which, so far as it gives us Major Jones's recollections of his life in the army, is lively and readable, and the general tone and temper of which are creditable to the writer. *The Emigrant's Friend* (3), of which Major Jones is also the author,

is intended as a guide to those persons who propose seeking their fortunes in the United States, and they cannot do better than attend to its hints. Major Jones warns the would-be emigrant not to leave the mother-country without fully and anxiously considering the subject in every aspect. He bids him "look at the dark side of the picture—the broad Atlantic, the dusty ride to the Great West, the scorching sun, the cold winter—coldest you ever experienced—and the hard work." "You may take my word for it," he says, "they work harder in the new than in the old country." But if people are bent on emigrating, Major Jones supplies them with valuable information in the shape of a description of each State and Territory, showing how far each is suitable for the emigrant in the matter of cheapness of land, climate, &c., and in useful directions as to the voyage, the journey from the seaboard to the West, and the commencement of his new career.

The promise of Captain Wilhelm's handsome volume (4) is, we are sorry to say, not kept. The reason is very simple. *Qui trop embrasse mal étreint*. Captain Wilhelm undertakes a great deal too much. He not only offers the "student of the science and art of war, persons interested in the local or reserve forces, libraries, as well as the editors of the daily press," *A Military Dictionary and Gazetteer*, which must in itself be a work of great magnitude to be of any use; but he further supplies them "with historical accounts of all North American Indians, as well as ancient warlike tribes, and a concise explanation of terms used in heraldry and the offices thereof." The natural result is that the book is very imperfect. The information given is in the main correct enough, but the information which those persons for whose benefit the book is designed are most likely to need is too frequently wanting.

The *Annual Report of the Chief of Engineers, United States Army* (5) is in every respect but its portentous length a pattern of what official publications should be. Only two hundred and fifty of the two thousand six hundred pages which are contained in its three volumes are, however, occupied with the Engineer's Report. The remaining pages contain the *pièces justificatives* in the shape of maps and reports from the Engineer's subordinates. The burden of the Report is the lamentable inefficiency of the Seacoast and Lake frontier defences of the United States.

The *Young Nimrods* (6) is an uppretending book in which the publishers have utilised a number of illustrations which had already done service in some of their other publications. The text appears, indeed, to have been written up to the cuts, some of which have really nothing to do with the subject of the book, although Mr. Knox has, with a courage which does him credit, worked them all in. Boys of the old as well as of the new world will find the book very interesting.

*A Handbook of Nursing* (7) is an admirable manual for the use of professional nurses. The directions are singularly clear and full. They appear, so far as laymen may presume to judge, to comprise every case of difficulty which can present itself to a nurse; and the fact that they are published under the direction of the Connecticut Training School for Nurses may be taken as evidence that they come up to the present standard of what we may venture to call the science of nursing. We must demur, however, to the designation of the book as for family and general use. The minute descriptions of the duties of the midwife and of the nurse who attends cases of lithotomy or ovariectomy, useful as they must be for the professional nurse, disqualify the book for family and general use.

The *Easiest Way in Housekeeping and Cooking* (8) is the most disagreeable contribution to what for many is a fascinating class of literature that we have ever met with. Mrs. Campbell occupies a considerable portion of her little book with a pretentious description of the process of digestion, and an unnecessarily full account of the various operations which go on in that great laboratory, the stomach. The information she supplies on these points will not assist any housekeeper to select provisions or cook them properly, and we feel the deepest sympathy for the American householder, if such a man there be, whose wife studies Mrs. Campbell's precepts and endeavours to apply them.

We have received the second volume of the *Index-Catalogue of the Library of the Surgeon-General's Office, United States Army* (9). It contains nearly a thousand pages, embracing authors and subjects from Berlioz to Cholas. The general arrangement is excellent, and, what is a matter of great importance to students of medicine, the *Index-Catalogue* is not confined to books, but gives the subjects of the more important papers published in the medical periodicals of all countries, and the names of the contributors. We have also received No. 10 of Bibliographical Contributions to the Library of Harvard University, entitled *Italielliana; a Bibliography of the*

(4) *A Military Dictionary and Gazetteer*. By Thomas Wilhelm, Captain Eighth Infantry. Philadelphia: Hamersly & Co. London: Trübner & Co. 1881.

(5) *Annual Report of the Chief of Engineers, United States Army, for the year 1880*. In Three Parts. Washington: Government Printing Office. London: Trübner & Co. 1880.

(6) *The Young Nimrods in North America: a Book for Boys*. By Thomas W. Knox. New York: Harper & Brothers. London: Sampson Low & Co. 1881.

(7) *A Handbook of Nursing for Family and General Use*. Philadelphia: Lippincott & Co. London: Trübner & Co. 1881.

(8) *The Easiest Way in Housekeeping and Cooking*. By Helen Campbell. New York: Fords, Howard, & Hulbert. London: Trübner & Co. 1881.

(9) *Index-Catalogue of the Library of the Surgeon-General's Office, United States Army—Authors and Subjects*. Vol. II. Berlioz—Cholas. Washington: Government Printing-Office. London: Trübner & Co. 1881.

(2) *Four Years in the Army of the Potomac: a Soldier's Recollections*. By Major Jones. London: The Tyne Publishing Company.

(3) *The Emigrant's Friend*. By Major Jones, United States Consul, Newcastle-upon-Tyne. London: The Tyne Publishing Company.

*Publications of James Orchard Halliwell-Phillips* (10). This little brochure, which is reprinted from the *Bulletin* of Harvard University, will possess considerable interest for all students of Shakespeare.

*Friends* (11) is worth the little time required to read it, and will deeply interest many who do read it. *The Georgians* (12) shows some promise. The author succeeds in the description of Southern life, but fails in telling his story. *A Gentleman of Leisure* (13) recounts the adventures of an American who, brought up in England and saturated with all the prejudices against his native land which, it appears, prevail in English aristocratic circles, visited New York upon business, was introduced into the best society of the Empire city, fell in love, and finally determined to enter Congress.

We have also received *A Book of Love Stories* (14), by Norah Perry, and *My College Days* (15), by Robert Tones, an old man's recollections of Hartford and of Edinburgh, where he began his studies in 1836.

Longfellow's *Leaflets* (16) are selections from his prose and poetical works, prefaced by a short memoir and copiously illustrated.

*The Hawaiian Almanac and Annual* (17) contains much statistical and other information which will be useful to all persons interested in the islands over which King Kalakaua rules.

We have received translations of two works which, so far as we are aware, have not before made their appearance in an English dress. Mr. Charles S. Sargent, Professor of Arboriculture in Harvard College, has, at the instance of the Massachusetts Society for the Promotion of Agriculture, translated from the French *A Treatise on Pruning Forest and Ornamental Trees*, by A. Des Cars (18). Mr. Sargent, who strongly recommends the method advocated by his author, suggests in his introduction that the time is close at hand when his countrymen will find it profitable to plant and rear new forests according to scientific principles.

*Synnöve Solbakken* (19) is the first volume of what is apparently intended to be a complete edition of the works of the famous Norwegian poet and novelist, Bjørnstjerne Bjørnson. The general accuracy of the version may be taken to be guaranteed by the co-operation of Mr. Bjørnson with the translator, Professor Erasmus B. Anderson.

Among the periodical publications which have reached us is the August number of *Harper's Magazine* (20), the most generally interesting paper in which is an account, very copiously illustrated, of the surrender of Lord Cornwallis at Yorktown, in October 1781. The centenary of this very important incident in the war is to be celebrated with much ceremony. We have also received *The Penn Monthly*, for July (21), which may be recommended for a remarkable paper on the "Need of a broader political education," by the Hon. Norman B. Eaton; *The American Art Review* (22), which maintains its high standard of excellence; and No. 6 of *The Southern Historical Society Papers* (23) for the current year, a publication to the value and interest of which we have already drawn attention.

(10) *Library of Harvard University.—Bibliographical Contributions.* No. 10. *Halliwelliana: a Bibliography of the Publications of James Orchard Halliwell-Phillips.* By Justin Winsor. Cambridge, Mass.: University Press. 1881.

(11) *Friends: a Duet.* By Elizabeth Stuart Phelps. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(12) *Round-Robin Series.—The Georgians.* Boston: Osgood & Co. London: Trübner & Co. 1881.

(13) *A Gentleman of Leisure.* By Edgar Fawcett. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(14) *A Book of Love Stories.* By Norah Perry. Boston: Osgood & Co. London: Trübner & Co. 1881.

(15) *My College Days.* By Robert Tones. New York: Harper & Brothers. 1880.

(16) *Leaflets from Standard Authors.—Poems and Prose Passages from the Works of Henry Wadsworth Longfellow.* Compiled by Josephine P. Hodgdon. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(17) *Hawaiian Almanac and Annual for 1881.* Honolulu: Thomas G. Thrum. London: Trübner & Co.

(18) *A Treatise on Pruning Forest and Ornamental Trees.* By A. Des Cars. Translated from the Seventh French Edition, by Charles S. Sargent. Boston: Williams & Co. London: Trübner & Co. 1881.

(19) *Synnöve Solbakken.* By Bjørnstjerne Bjørnson. Translated from the Norse. By Erasmus B. Anderson. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(20) *Harper's Magazine.* London: Sampson Low & Co.

(21) *The Penn Monthly.* For July. Philadelphia: Stern & Co. London: Sampson Low & Co.

(22) *The American Art Review.* London: Sampson Low & Co.

(23) *The Southern Historical Society Papers.* Richmond, Va.: Secretary Southern Historical Society.

We are informed that the Author of "Practical Keramics for Students," reviewed in the SATURDAY REVIEW, July 2, 1881, is not Charles A. Janvier, but CATHERINE A. JANVIER, the mistake being due to the English publishers.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

## THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,348, AUGUST 27, 1881.

The French Commercial Treaty. The Indian Budget. Election of Members of the House of Commons. The Pope at Malta. The French Elections. Prisoners and Colleges. Reform in Victoria. First Fruits of the Trade with Egypt. Decoying.

The Session. A Lesson in Humour. Turtles and Insects. Pocomacation. Autumn in the Highlands. Yacht-Racing. The Drain of Gold. The Theatre.

Brewer's English Studies. Ionian Antiquities. Lieutenant Barnabas. Farrar's Mercy and Judgment. Nos Auteurs Dramatiques. Chaucer. Colonel Playfair's Mediterranean. Folk-Lore of Scotland. Among the Hills. American Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

## ADVERTISEMENTS.

DORIS GREAT WORKS, "CHRIST LEAVING THE TABERNACLE," "CHRIST ENTERING JERUSALEM," and "CHRIST'S ASCENSION BEFORE PHARAOH," each 35 by 25 feet, with "Dream of Philip's Wife," "Christian Martyrs," &c. at the DORE GALLERY, 35 New Bond Street. Daily, Ten to Six. Is.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE. OPEN SCHOLARSHIPS IN SCIENCE.

TWO SCHOLARSHIPS of the value of £150 each, tenable for one year, will be competed for on September 26th, and the three succeeding days. One of the value of £150 will be awarded to the best candidate at this Examination, under twenty years of age, if of sufficient merit. For the other, candidates must be under 35 years of age.

The subjects for Examination are Physics, Chemistry, Botany, and Zoology. The Entrance Examination will be completed for at the same time. The subjects of examination are Latin, Mathematics, and any two of the three following languages, Greek, French, German. This is an Open Examination of the value of £50.

Candidates must not have entered to the Medical or Surgical Practice of any Metropolitan Medical School.

The successful candidates will be required to enter at St. Bartholomew's Hospital in the October succeeding the examination.

For particulars application may be made to the WARDEN of the College, St. Bartholomew's Hospital, E.C.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde Park Corner, W.

The WINTER SESSION will commence on Monday, October 2, with an INTRODUCTORY ADDRESS by MR. J. WARRINGTON HUNTER, M.D., F.R.S.

The William Hounslow £100 and £10 Exhibitions are open to all Perpetual Students. The Two Brackenbury Prizes of £50 each, Sir Charles Clarke's Prize, the Thompson Medal, the Treasurer's, Brodie, Acland, Johnson, and General Proficiency Prizes, are open to all Students.

The appointments of House Physician and House Surgeon, of which there are four, are held each for one year, are awarded by competition, and no charge is made by the Governors of the Hospital for Board or Residence.

Clerkships and Dressings, and all the minor appointments, are given without extra fee. A Prospectus of the School, and further information, may be obtained by personal application between One and Three P.M., or by letter addressed to the DEAN of the Hospital.

THE LONDON HOSPITAL and MEDICAL COLLEGE.

Mile-end, E.—The SESSION 1881-82 will commence on Saturday, October 1, 1881. FOUR ENTRANCE SCHOLARSHIPS, value £50, £40, £30, and £20 will be offered for competition at the end of September to new Students. Entries on or before September 20. Fee for Lectures and Hospital Practice, 50 Guineas in one payment, or 100 Guineas in three instalments. All Resident and other Hospital Appointments are free. The Resident Appointments consist of Five House-Physicians, Four House-Surgeons, and One Apocourneurship; Two Dressers and Two Maternity Pupils also reside in the Hospital. Special entries may be made for Medical and Surgical practice. The London Hospital is now in direct communication by rail and tram with all parts of the Metropolis.

MUNRO SCOTT, Warden.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

For the Science and Practice of Agriculture. For Intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c. The R.A.C. Farm, surrounding the College, is a mixed farm of about 800 Acres. Chairman of Committee of Management—The Right Hon. the Earl of DUCIE. For Prospectus of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

THE GUILDHALL SCHOOL of MUSIC, under the conduct and control of the Corporation of London.

Principal—Mr. H. WEIST HILL.

The FIRST TERM of the SESSION 1881-82 will commence on Monday, September 19, 1881. EXAMINATIONS of CANDIDATES for ADMISSION as STUDENTS will be held on Saturday, September 16, and Monday, September 18, from Twelve till Four, when Candidates must attend, in person, to be examined.

For further particulars apply at the School, 10 Aldermanbury, E.C.

GUILDHALL, August 1881.

FRED. A. CATTY, Hon. Secretary.

CHARLES F. SMITH, Secretary.

CRYSTAL PALACE SCHOOL of LANDSCAPE GARDENING.

Principal—Mr. EDWARD MILLNER. The NEXT TERM will commence on Saturday, October 1. Prospectus in the Office of the Crystal Palace Company's School of Art, Science, and Literature, in the Library, next Elysian Court, Crystal Palace.

F. K. J. SHENTON, Superintendent Literary Department.

COLLEGE of PRACTICAL ENGINEERING, MUSWELL HILL, London.

Under eminent technical appliances.—For terms and particulars write to the PRINCIPAL.

ISLE of WIGHT PROPRIETARY COLLEGE, APLEY (near RYDE).

The WINTER TERM will commence on Friday, September 16.

Full particulars from the Rev. Canon TERSDALE, Head-Master; or the SECRETARY, The Cottage, Melville Street, Ryde.

DOVER COLLEGE.

NEXT TERM will commence on September 14. Board, £40; house rent, 2 Guineas. Tuition from 12 to 18 Guineas.—Apply to the Rev. W. BALL, M.A., Head-Master; or WOLLANTON KROOKER, Esq., Honorary Secretary.

MALVERN COLLEGE.

The NEXT TERM commences Tuesday, September 27.

EXAMINATIONS for SCHOLARSHIPS, December 28 and 29.

For information, apply to HENRY ALDRIDGE, Esq., Secretary.

S. ANDREW'S COLLEGE, CHARDSTOCK, Dorset.

RE-OPENS September 14. Preparation for Universities and Public Schools. Moderate and inclusive fees.—Apply to SECRETARY.

WORTHING COLLEGE, SUSSEX.

Principal—Mr. W. E. LLOYD TREVOR. Vice-Principal—Mr. FREDERIC LOWE, B.A. Graduates in Honour, St. John's College, Cambridge.

Boys prepared for Public Schools, the Universities, the Civil and Military Examination, List of great success and Prospectus forwarded on application. The WINTER TERM will commence on Tuesday, September 12.

THE  
**SATURDAY REVIEW**  
OF  
POLITICS, LITERATURE, SCIENCE, AND ART.

Transmission abroad.]

Price 6d.

LAND REFORM.

THE latest commonplace which Liberal candidates and orators are expected to repeat has been sanctioned on several occasions by Mr. GLADSTONE; and perhaps the vague demand for changes of various kinds in the Land Laws may consolidate itself into a troublesome agitation. Land reform, as it is sometimes called, admits of several meanings; and it must be practically interpreted by reference to the political and economic conditions of the present time. The profound and widespread agricultural distress of the last two years will be greatly aggravated by the inclement weather which has lately prevailed; and it is not surprising that farmers should listen favourably to any proposal which purports to relieve them in a greater or less degree from their present difficulties. At the same time, theorists and demagogues already speculate on the application to England and Scotland of the anomalous principles of the Irish Land Act. The promoters of the measure affirmed and exaggerated the proposition that the relations of landlord and tenant in Ireland depended on customary tenure rather than on contract, and that it was therefore reasonable to recognize claims for which, as they admitted, there would have been no foundation in England. Now that Irish landlords have been deprived of rights which had until lately never been questioned, the assailants of landed property are busily obliterating the distinctions which they had during the late agitation elaborated with incessant activity. Taking advantage of the existing agricultural distress, the agitators insist that the supposed defects of English tenure shall in turn be corrected by legislation. In Kent a kind of Land League has already been formed, on the Irish model, for the purpose of depriving, not the landlord, but the tithe-owner, of pecuniary rights secured to him by statute law. The Farmers' Alliance, though it cannot be accused of proposing spoliation by means of illegal violence, has sometimes countenanced utterly unjust demands for the compulsory transfer of a share in the ownership from the landlord to the tenant. It might have been supposed that English occupiers under lease or agreement could only found pretensions on the terms of their contracts. It is within the competence of the Legislature to regulate the terms on which land may hereafter be demised; but orators who assert that the system of English land tenure is the worst in Europe cherish more ambitious aspirations.

Those who contend that the need of changes in the law of land are urgent cannot, if they understand their own language, refer to theories as to the future devolution of property. It is evident that the immediate abolition of settlement, of entail, and of all similar institutions, could only operate gradually and at comparatively distant periods. The numerous advocates of schemes which might possibly facilitate the subdivision of the land have rightly or wrongly persuaded themselves that the abolition of life estates would encourage the expenditure of capital on land. Even if their conjectures are well founded, the result can only be attained by slow degrees. It is hardly probable that Parliament would at a single stroke deprive of their property all owners of land in remainder or reversion, and even if life tenants suddenly became owners in fee, only a small portion of the whole number would take advantage of their sudden change of condition to sell their land piecemeal. The full effect of even so violent a change

in the law would not be felt for one or two generations. The adversaries of the existing system often expatiate on the alleged efficacy of law in guiding and forming opinion or custom; but the tradition of centuries will be for some time as efficacious as new-fangled legislation, and as long as any liberty of disposal remains, the old English desire to found or maintain a family will tend to prevent or delay the dispersion of large estates. Some years may probably elapse before democratic agitation is directed to its ultimate object in the compulsory division of land on each transmission by descent. The social revolution which would ensue is easier to foresee than the economic consequences of discouraging farming on a large scale. It is uncertain whether any legislative measure will render possible the transfer of the soil to a large number of freehold cultivators. For the present purpose it is sufficient to know that the abolition of large estates and of large farms cannot be urgently required, because it must, in default of a violent revolution, be effected slowly, if at all. The agitators who have secured for their movement the ready sympathy of the PRIME MINISTER must have other innovations in view. They are much less interested in the prohibition of life estates than in the imposition of disabilities on landlords for the supposed advantage of tenants.

The removal of alleged impediments to the liberal expenditure of capital on the improvement of land may perhaps be a proper object of legislation; while, on the other hand, the proposition that the land ought to be made to produce as much as possible is altogether untrue. It might as well be said that it was the duty of Lancashire to produce the largest possible amount of cotton goods without reference to the cost of material or manufacture, or of the profit to be obtained. There are probably cases in which life tenants are unwilling or unable to make an outlay which might be profitably undertaken by an absolute owner. That such instances are comparatively rare is proved by the notorious fact that the largest estates, which are almost always subject to settlement, are the best managed. The proposition may be open to dispute, but the controversy has at this moment little practical importance. The great majority of landowners are impoverished; and most of those who have extraneous means at their disposal have now little temptation to invest capital in improvement of land. Few tenants are disposed to pay interest on any expenditure of the kind; and it matters little except to himself whether a proprietor with half a dozen farms thrown on his hands is a life tenant or an owner in fee. The landed interest flourished while settlement and entail were generally practised, and it is reduced to distress not by bad laws, but by bad seasons, coinciding with American competition. The suffering is not confined to the class which depends on the receipt of rent; for farmers complain sometimes, perhaps not without exaggeration, that with recent crops and recent prices they are unable to pay their working expenses. It may be true that the large farmers are the heaviest losers; but it is not necessary suddenly to alter the opinion which has till of late been generally held, that cultivation, in common with other branches of industry, is most profitably conducted by the scientific methods which are only within the reach of capitalists. Even in the amount of gross produce English agriculture has compared favourably with that of countries which are cultivated under a different system; and it is not less

abused to test the advantage of large or small holdings by the total amount produced than to apply a similar standard to a manufactory without reference to cost. The fabulous times in which every rood of ground maintained its man must have witnessed the greatest possible waste of labour. It is perhaps useless to expose fallacies which are not sincerely propounded by the instigators of popular clamour. The Radical clubs and their sycophants are bent on attaining results which are remote from the application of capital to land.

The precedent which demagogues desire to apply and extend is not the legislation which in some countries has been directed against perpetuities or against trusts, but the Irish Land Act, and the recognition of a joint property with the owner to be acquired by the occupier. Some speakers at meetings of the Farmers' Alliance have claimed, not only a tenant-right unknown to English law and practice, but a power of compulsory purchase of the landowner's interest. The cant phrase of free trade in land is often used to express a state of things in which absolute ownership would be prohibited, except when it was combined with occupation of the soil. Measures of this kind are said to be urgent, because it is thought possible that they may be passed at a time when opinion and moral sense are vitiated by anomalous legislation. There never was, in truth, a time in which it was less necessary than at present to interfere for the benefit of the tenant-farmer with his relations to his landlord. In England and Scotland there is no question of evictions, or objections, for the main difficulty of the landowner is to keep his tenant on his farm. The occupier, even when he holds a lease, is not practically bound by its provisions. If he is farming, or if he professes to farm, at a loss, it is impossible to insist on the literal performance of his engagements. The tenant from year to year has a still more direct control of the terms of any bargain which may be made. The time is perhaps past for enforcing restrictions on the mode of cultivation, which nevertheless often embodied the soundest agricultural traditions. Landowners now have to be satisfied with reasonable security for the payment of a moderate rent, and they probably trust to the character of the tenant for any protection which they may hope to obtain against the deterioration of the soil. The only plausible demand of agrarian agitators is that the Act passed some years ago for the protection of unexhausted improvements should be made compulsory. The mischievous tendency of modern legislation to interfere with independent action is illustrated by the objections which have been made to the permissive character of the present law. If a tenant on taking his farm contracts himself out of the Act, it is reasonable to assume that he has received an equivalent for the benefit which he renounces; but there is no doubt that, as a general rule, the outgoing tenant is equitably entitled to repayment for outlay of which he has not already received the full benefit. In many districts the custom of the country gave the tenant ample protection before the passing of the Act. The desire of some prudent landlords to escape from the provisions of the law is founded on their knowledge that they might often have to pay for imaginary improvements. At the end of a tenancy a farm is, in the majority of cases, in worse condition than at the beginning; for unexhausted improvements in many instances consist of the partial destruction of the property which was originally transferred from the landlord to the tenant; but compensation would almost always be demanded. A scrupulous Minister would ascertain in the first instance the nature of the demands which he undertakes in general terms to concede.

#### DECORATED SPEAKERS.

THE custom which ordains that at the end of a Session, especially a very busy or in any way a very remarkable Session, honours and decorations shall descend on the members of that party which has a temporary majority in the House of Commons, is, in itself, a sufficiently graceful one. When, at the beginning of this week, a batch of peers was announced, nobody found fault with the additions to the much-threatened Upper House, and nobody was surprised that these additions had allowed themselves to be added to it. The chief organ of their own party, indeed, told the new peers that it was principally satisfied with their elevation to the House of Lords because they

were of no possible use out of it; but that was only part of the game. *Qui dit pair dit vaurien* is the latest Radical proverb, and the unfortunate objects of Mr. GLADSTONE's desire to be a fountain of honour got the benefit of it. But it may be repeated that nobody was surprised at the creations. That Mr. GLADSTONE should periodically struggle to find persons good enough to swell the minority in the House of Lords, and that these persons should in a considerable number of instances swell the majority instead, is a regular and recurring scene of the political drama. That Scotch and Irish peers should be glad to escape from the MAHOMET'S coffin in which they hover between commoners and peers of Parliament; that a hitherto unsuccessful candidate for a great historical honour should meanwhile accept a lesser one, that a representative of the CLIFFORDS should not consider himself altogether out of place in the Upper House—all this was reasonable enough. It was rather more surprising when a day or two later the announcement was made that the SPEAKER of the House of Commons had accepted the Grand Cross of the Bath. There is certainly a precedent for such a thing, and there is nothing more comforting to a well-regulated mind than a precedent. But that the SPEAKER, who is supposed to occupy such a position already that when he chooses to vacate it a peerage is his almost by right—that, in particular, a SPEAKER who is heir-presumptive to one of the oldest of English baronies should think it worth his while to accept this decoration, certainly seemed a little odd. It is needless to say that the Grand Cross of the Bath is a most honourable distinction; but honour, like other things, is relative. In certain professions, and especially in the army, it is the very highest non-hereditary honour to which a good servant of his country can aspire. It may now and then be taken by a great noble as a mark of personal eminence. It has been known to be selected in preference to any hereditary honour by politicians of merit, but of fortune insufficient to support honours which are transmitted by descent. Mr. BRAND does not come under either of these heads, and so it has not unnaturally been thought that it was odd of him to take it, and odd of Mr. GLADSTONE—if in Mr. GLADSTONE anything could be odd—to offer it.

Not a few critics have gone further than this process of lifting up the eyebrow. On the extreme right and on the extreme left heads have been shaken at Mr. GLADSTONE and at Sir HENRY BRAND. It is remembered that the present Session has not been an ordinary Session in which the SPEAKER has been a god of EPICURUS, not to say a Grand Lama. He has been a very active principle, indeed, and the Government has been indebted to him for very vigorous action. He has suspended, we forget how many members; he has attempted and carried a mild *coup d'état*; and he has occupied (so it is whispered by malcontents) the position of an agent of the Government of the day rather than of a sublime and independent power, to whom Governments and Oppositions are not, except as things that sit by a purely arbitrary accident on his right hand and on his left. All this being, or being supposed to be, the case, suspicions appear to have entered the minds of certain guardians of the commonweal. Everybody is quite certain that the motives of Mr. GLADSTONE and of the SPEAKER are super-excellent, but everybody does not seem to be quite certain that they may not be open to misconstruction. Will not future Speakers be bribed by these glittering baits to make themselves tools of a Ministry? Will not the suspicion of a G.C.B. dangling before his persecutor embitter the mind of the first Irish member whom Sir HENRY BRAND's successor—may he be distant!—suspends? Will not Mr. BRADLAUGH's spirited addresses be filled with the darkest imputations when he perceives this lavishing of the favours of a corrupt Court upon his chief persecutor? These and other questions of the kind appear to disturb the minds of some of our contemporaries very much indeed, and they are even more disturbed about the future than about the present. The stars and ribbons of the different orders will, it would appear, be wandering fires to draw Speakers away from their duty, and in times to come Speakers will have more of this miscellaneous duty to do than ever. The precedent is very sad one, and much to be regretted by all lovers of the British Constitution on one hand or the Bill of Rights, the other—things which are here mentioned not in the least because they are opposed to each other, but because they are perhaps the favourite symbolical forms in which

the two opposite parties choose to consider or at least to talk of the same thing.

It would probably be difficult to find a more wrong-headed way of thinking or of saying a somewhat sensible thing than this objection. The idea of a Speaker being corrupted by a yard of ribbon, and a certain amount of jeweller's work, still more the idea of future Speakers vying with each other in prostituting their office for the sake of these decorations, is, perhaps, one of the most fantastically absurd that has occurred to presumably sane persons of late. We are to suppose a Speaker laboriously counting up the number of members suspended by his predecessor, and wondering whether the same number will do for his own promotion; looking at his watch, to see whether the precious decoration depends on his stopping a debate an hour or two later or earlier; diligently marking a dictionary of Parliamentary and unparliamentary terms, so as to be quite sure of stretching a point in favour of Ministers and against their opponents, lest haply he miss his G.C.B. Sensitive politicians of this stamp may be assured that they quite mistake what they have to fear. When there are Speakers of the House of Commons capable of making themselves tools of Ministers for the sake of Grand Crosses of the Bath, it really will not matter much whether Grand Crosses of the Bath are given to them or not. The ribbon and the cross and the collar will only be the sign and symbol of a degradation already accomplished, and that degradation is not at all likely to be hastened by the granting of the decorations or retarded by the refusing of them. The real reason for objecting to the proceeding is that it seems to argue on the part of the responsible Minister an entire blindness to the nature, not merely of the office of Speaker, but of the particular dignity conferred on him. It has been said that honours are honourable in an altogether relative degree. Everybody knows the story of ELIZABETH declining to bestow a peerage because, having knighted the proposed peer, she had nothing further to do for him. Supposing the story authentic, and the view of ordinary knighthood which it suggests actually current, the distinction now conferred on a ten-days' Solicitor-General, or a mayor of a provincial town who happens to welcome a royal personage, or a sufficiently busy and pushing secretary of a congress of seismologists, would have been perfectly appropriate to the SPEAKER. It would have been none the less, but rather the more, appropriate because he had done his duty in a trying time. For it is a new and dangerous doctrine that a Speaker, by keeping order in Parliament, confers a favour on the Ministry of the day or does a service to them. It is the duty of the Ministry to support the Speaker, not of the Speaker to support the Ministry; and his services are rendered to the Crown and the nation, not to any party. The Speaker in repressing disorder is warring against a public enemy, and rewards bestowed on him are in the same category as rewards bestowed on a general for good conduct in the field. But it does not follow that exactly the same reward is appropriate in the one case as in the other. The general is often a man comparatively destitute of social rank, and a decoration which confers social rank at the same time that it expresses the favour of the Crown is therefore becoming to him. There is no social rank among commoners to which a Speaker while he is a commoner is not superior, and to tie a string of letters after his name and a string of silk round his body is therefore a ludicrous piece of ignorance rather than of impolicy. But possibly the sense of the honour which any mark of his own approval confers has outweighed everything else with Mr. GLADSTONE.

#### THE LEWISOHN CASE.

SINCE the prorogation of Parliament any hope of redress for his past expulsion from Russia which Mr. LEWISOHN may have entertained must be disappointed or suspended, when the limited toleration extended to him has expired. It is only by means of questions repeatedly asked in the House of Commons that the Foreign Office can be induced to persist in the ungrateful task of remonstrating with the Russian Government. Lord GRANVILLE scarcely be expected to undertake the conduct of a personal controversy of secondary importance; but on reading over the papers which have been published, with his consent, he may, perhaps, think it expedient to remind his representatives at St. Petersburg that a supercilious

indifference to the grievances of British subjects is not calculated to win the approval of their superiors. Mr. LEWISOHN, a London merchant and naturalized British subject, having a year ago arrived in St. Petersburg from Nishni Novogorod and Moscow, received notice to quit the capital in twenty-four hours, and to leave Russia without delay. It is not disputed that the only ground of his expulsion was that he is by origin and creed a Jew; nor have the Russian authorities either apologized for their harsh proceeding, or allowed Mr. LEWISOHN to return to Russia for the prosecution of his business. In answer to a note addressed to the Russian Foreign Office by Lord GRANVILLE's direction, M. DE GIERS replied that he had given the necessary permission; but he afterwards found that the document which he had signed contained only a reference to the Minister of the Interior. On receiving the order to leave St. Petersburg, Mr. LEWISOHN called at the English Embassy, where he was informed by a person whom he supposed to be a member of the official staff, that foreign Jews were not allowed to stay in the capital. His informant was, as it afterwards appeared, only a servant; and it is not worth while to inquire whether he was to blame for Mr. LEWISOHN's misapprehension. The *Chargé d'Affaires* unreasonably reproaches Mr. LEWISOHN for not having sent a message to some member of the Embassy; or for not having applied to Mr. PLUNKETT himself, who happened, without Mr. LEWISOHN's knowledge, to be staying in the same hotel. He adds that he might, if he had known of the occurrence, probably have obtained, as a favour from the police, permission to Mr. LEWISOHN to prolong his stay. There might, perhaps, have been some inconvenience in the acceptance as a favour of a concession which has since been demanded as a right.

In his first communication to the Foreign Office Mr. PLUNKETT broadly asserted that the expulsion of Mr. LEWISOHN was conformable to law. The legal adviser of the Embassy, a Russian advocate, having by Lord GRANVILLE's direction been consulted, arrived at an exactly opposite conclusion. The question turns on the terms of a treaty between Great Britain and Russia, and on certain regulations which contain the conditions on which passports are issued. British subjects visiting Russia are, by a kind of favoured nation clause, entitled to the same privileges with natives; but native Jews in Russia are liable to all manner of restrictions and disabilities, and the Russian Government probably holds that their alien co-religionaries are not entitled to be placed in a better position. The legal adviser, by whose opinion the Embassy ought to have been guided, distinctly states that the expulsion and the prohibition to return are both irregular. Throughout the short correspondence the English officials at St. Petersburg were apparently biassed against Mr. LEWISOHN, not because he was a Jew, but because he gave them trouble. It seems from some incidental notices that the American Minister is not equally cosmopolitan in his sympathies; but, although he has repeatedly protested against similar hardships inflicted on Jewish citizens of the United States, he appears thus far to have obtained no redress. It happened that many years ago a discussion involving the same principle arose between the English and American Governments. The authorities at Charleston imprisoned certain coloured sailors who came to the port in an English vessel. The Government of South Carolina contended that the laws affecting negroes applied to foreigners as well as to natives; and the Federal Cabinet, with which the negotiation was of course conducted, to a certain extent supported the claim of the State. The matter was probably at last settled by some compromise.

Mr. LEWISOHN is one of many sufferers by the want of legal sanction to the covenants and customs which are figuratively described as international law. If the Russian Government thinks fit to practise injustice within certain undefined limits towards British subjects, the English Government can only endeavour to persuade or convince the EMPEROR and his Ministers that they are in the wrong. It is impossible to go to war because a Jewish merchant has been vexatiously interrupted in the conduct of his lawful business; and, unfortunately, there is no minor penalty for the violation of international right. From the nature of the case it would be difficult to resort to reprisals, which indeed are seldom employed, except on the verge of war. Lord PALMERSTON, to a certain extent, secured to English subjects the traditional privileges of Roman citizens by his willingness to prosecute quarrels on sufficient reason. Mr. GLADSTONE on more than one occasion proved, with his customary eloquence, that England was not the Roman

Empire; and that Englishmen were not entitled to exceptional privileges; but the bold spirit and patriotic bearing of the Foreign Minister were then much more popular than the self-denying spirit of the dispassionate philanthropist. Mr. GLADSTONE scarcely understood that, notwithstanding appearances, Lord PALMERSTON was as prudent as himself. The cause of the Portuguese Jew who had a claim on the Government of Athens was taken in hand, not for his own sake, but because the English Minister wished to address a warning through the Greek Government to France. Mr. LEWISOHN represents no cause, except that of the Jewish community in England, which, with all its wealth and influence, would neither expect nor desire a vindication of its claims by warlike demonstrations. If, as seems probable, General IGNATIEFF or his colleagues refuse to listen to Lord GRANVILLE's arguments, nothing remains but to acquiesce in wilful injustice. In some instances petty affronts are offered by one Government to another for the purpose of furnishing the means of future concessions. No other motive can be plausibly suggested for a petty discourtesy and for a wanton display of intolerance and injustice. It has been generally supposed that the Russian Government was inclined to treat Mr. GLADSTONE and his colleagues with almost ostentatious deference.

In the course of correspondence or conversation M. DE GIERS stated, in excuse for the harshness of Russian legislation, that the Nihilists were largely recruited from the ranks of the Jews. It is possible that the Government may really attribute revolutionary tendencies both to native and foreign members of a community which is systematically persecuted in different parts of the Empire; but even a Russian police functionary knows that London merchants on a large scale have no subversive designs. It is much more probable that their combinations excite the alarm or envy of commercial rivals who may perhaps find means of obtaining official support. The policy of discountenancing and annoying the chief money-dealers of Europe must admit of some explanation, though it can scarcely be justified. The so-called Jew-baiters of Germany share and cultivate a popular prejudice from which statesmen of the highest rank appear not to be wholly exempt. The objects of persecution are the humbler class of small capitalists who, like their coreligionists in almost all parts of the world, have a monopoly of the business of local money-lending. Russian Ministers are less in the habit of consulting the tastes and wishes of the vulgar; and the Government certainly disapproves of the outrages which have been perpetrated against the Jews in the Southern provinces. It is, after all, possible that the expulsion of Mr. LEWISOHN may have been caused by some petty squabble or jealousy between different departments. The regulations provide that passports issued to persons who appear by their names to be Jews shall be submitted to the Minister of the Interior, that he may decide on the expediency of permitting them to reside. Mr. LEWISOHN's passport, issued by the Foreign Minister in Downing Street, was regularly viséd at the Russian Embassy, where perhaps the Jewish appearance of his name may not have been noticed. A similar oversight may account for his freedom from annoyance during his stay at Nishni Novogorod and at Moscow. A touchy subordinate in the Ministry of the Interior possibly regarded as a grievance the omission of the proper officers to transmit the document to his department; and it would be consistent with the true official temper to resent the negligence of some local underling at the expense of the holder of the passport when race and religion pointed him out for persecution. If it is in such cases impossible to secure redress, the next alternative is to make every breach of international courtesy or right as troublesome as possible to the offending Government. Foreign Ministers will be less inclined to interfere with the rights of British subjects if they know that a miscarriage with reference to a passport is likely to be followed by a long correspondence. They may also, perhaps, from time to time glance at the notice papers or reports of the House of Commons containing questions which are followed by unpalatable discussion on Russian misgovernment. One such case as that of Mr. LEWISOHN destroys the effect of half-a-dozen reassuring communications addressed through Under-Secretaries of State to the House of Commons.

#### THE NEW DEAN OF WESTMINSTER.

*QUI vivra verra.* Dr. BRADLEY is Dean of Westminster. We do not ask, as an inquisitive paper once did on the morrow of an unexpected choice of a Presidential candidate, "Who is FRANKLIN PIERCE?" for Dr. BRADLEY's name is well known to all who are interested in academical success. But we may ask why is Dr. BRADLEY Dean of Westminster? Daily omniscience has told us that there is to be no breach of continuity between him and Dr. STANLEY. This is consoling; but we should like to be quite clear as to what is to be continued. We have often spoken of Dr. STANLEY, and always with plainness of speech. We have admired his brilliancy, activity, learning, and devotion to his view of duty, without shrinking from pointing out the perils into which his eccentricities might have led the Church and himself. Now, we should like to know whether Dr. BRADLEY is to continue the brilliancy or the eccentricity? On this the world is profoundly ignorant. It has a general idea that Dr. BRADLEY is a Broad Churchman, as Dr. STANLEY used also to be called. But when a man has been ticketed a Broad Churchman with nothing added to the description, the whole definition, for practical purposes, has still to be constructed. Unfortunately for this process, in the case of Dr. BRADLEY, the materials, as far as we know, have not yet been produced, when the question is of his fitness for an ecclesiastical post of peculiar responsibility. Dr. BRADLEY, after a term of under-mastership at Rugby, achieved much reputation by his discharge of the semi-secular duties of Head-master of Marlborough School, and he was called upon a few years back to infuse modern ideas into University College, Oxford, which had long been reposing under Dr. PLUMPTRE's dignified presence. It cannot be forgotten that, so lately as in the present year, the merits of the Master of University College were further recognized by the addition to his labours of the responsibility of a stall at Worcester Cathedral, a post of which the duties can be so arranged as to afford pleasurable change of occupation and of scene to heads of Houses during the Long Vacation. Stalls are given for very various reasons, and they are emphatically a kind of patronage which is indulgently criticized if the recipient can show any reason for the preference. Dr. BRADLEY was certainly a man of merit, and Dr. BRADLEY's merit seemed to have been adequately recognized by his finding himself in the prime of life Master of University College and Canon of Worcester. Now, after a very short tenure, both posts are vacant, and we have to welcome in Dr. BRADLEY the successor of WILBERFORCE, BUCKLAND, TRENCH, and STANLEY. Mr. GLADSTONE may have struck on a rich vein of virgin ore. If so, there will be plenty of voices to praise his prescience. But, if the result be limited to the adequate performance of routine duties, curious people will ask why two corporations like University College and Worcester Cathedral were both of them disturbed, while so many divines who have done great things for religion in the direct way of their Churchmanship have been overlooked in the selection for a post which requires many more qualifications than those only of a successful schoolmaster.

It would be no answer to such inquiries to point to the list of Deans all round and ask whether Dr. BRADLEY was not at least up to the mark of the more distinguished moiety of them. A Dean of Westminster is as much more than merely a Dean as the Comte d'ARROIS was more than a Count, or MONTMORENCY, "premier Baron Chrétien," more than such another Baron as one of the Exchequer. When we say that this special Dean is necessarily by office, and ought really to be in character, a great personage, we use an expression which, under apparently vague language, is thoroughly expressive to the intelligent. It is for those who offer Deaneries of Westminster and for those who accept them to see that posterity shall not be compelled to hold silence over the ancient boast that the Dean of Westminster is a great personage in Church and State.

#### M. PAUL BERT.

M. PAUL BERT has been delivering a discourse in aid of a secular school in Paris which may prove to have more influence upon French affairs than all the directly political speeches which have been called forth

by the recent elections. Its importance is derived less from the contents of the address than from the fact that, these contents being what they are, the address should have been delivered by a man who is generally looked upon as the next Minister of Education, and delivered in the presence, and honoured with the express approval, of a man who is generally looked upon as the next Prime Minister. In fact, M. GAMBETTA almost gave M. BERT a Cabinet office on the spot. "Your cheers," he told the meeting, when the speech was ended, "do more than crown M. BERT's past; they illuminate his future. His eloquence is of the kind that makes us all better and stronger." After this we must suppose that M. GAMBETTA adopts as his own all the main lines of M. BERT's discourse. He may attempt, as his custom is, to back out of them hereafter; but he will find that M. BERT's words will be remembered by others, who will not fail to pin him down to all that M. BERT has said and that he has accepted. It is difficult to find an English parallel which will at all reproduce the strange state of things which these facts indicate, and yet not seem preposterous. M. PAUL BERT and the yet greater man before whom he was speaking have certainly taken off the gloves. They evidently mean fighting, and as becomes men in this attitude, they are careful to leave no one in doubt as to who it is that they are about to attack. There is an end to the old subterfuge about "Clericalism" being the enemy. The object of their hatred is neither Clericalism nor even Catholicism, but Christianity.

M. BERT's speech markedly divides itself into two parts. There is the part which is meant to amuse the audience, and the part which is meant to define a policy. In the former he naturally devotes himself to attacking Catholicism. It is the only religion about which the majority of Frenchmen know anything, and it unfortunately furnishes him with just the material which he is in want of. If only half M. BERT's quotations are from books which are really used in Catholic schools, the authorities who allow them to be used deserve the gravest censure. No doubt they produce a very different effect when they are all brought together than when they are scattered over a mass of instruction, the general tone of which is simpler and healthier. But the boasted organization of the French Church was turned to very little account when it suffered the kind of literature which has served M. BERT's purpose so well to come into use in French schools. Many, perhaps all, of the solutions of moral puzzles which M. BERT quotes are harmless enough so long as they are confined to the writings of casuists. But it certainly seems unnecessary to inform small children of the conditions under which the taking of another person's property is not stealing, or restitution of the thing stolen not a duty. Children thus brought up are just as honest as other children, but an ingenious advocate has no difficulty in convincing a free-thinking audience that such teaching is no better than that given by a professional thief. The prudishness which is near akin to prurience is not uncommon in France, but it would undoubtedly have been well if French religious literature had in this respect been more Catholic and less national. M. BERT, however, is hardly the man to cast the first stone, for more than one of his allusions would have commended themselves to his hearers on the ground of indecency, if they had not had a stronger claim to their admiration on the score of profanity. Others of the religious books in use in French schools seem to be written much in the tone of the publications of the Salvation Army, though the terminology has to do with railways instead of with troops. Travellers to Heaven are told the price of the various tickets, and are given their choice between the express train of poverty, chastity, and obedience, which carries only first-class passengers, and the fast train of piety, devotion, and the sacraments, which carries first and second-class passengers. In fact, the familiar language of a railway time-table is consistently reproduced; the scholar is incited to diligence by the reminder that on this line there are no sleeping carriages, and consoled by the assurance that the passenger for Paradise need not take a return ticket. If the clergy who have so long marched wherever Cardinal DE BONNECHOSE tells them had been added to make a tour of inspection of all the schools of which they have till now had the control, M. BERT might have been deprived of some of the most telling parts of his speech.

It is not these things, however, that make the speech important. It is that when M. BERT becomes serious, and sums up the reasons which make him think religious instruction positively mischievous, it turns out that it is not the absurdities or the excrescences of Catholicism that really move his indignation, but its essence. The fundamental vice of religious instruction, according to M. BERT, is that it teaches self-distrust, instead of self-confidence, and leads men to look to prayer instead of to their own exertions. The teaching of the Church rests on grace, and grace is only another word for caprice; and upon faith, which is the mother of superstition. The State has at last banished this mischievous education from the public schools; its business must now be to give such an education in place of it as shall put French children beyond all danger of ever again listening to the sorcerer. If this is to be the accepted aim of the new Republican majority, it is not easy to see how they can long resist the argument which the *Justice* has already founded on M. BERT's speech. Religious teaching, says M. BERT, with M. GAMBETTA listening and assenting, is anti-social and corrupting. Why then, says M. CLÉMENTEAU's organ, do you—MM. GAMBETTA and BERT—advocate the payment of many thousand functionaries to give this teaching to the nation? The inconsistency is too flagrant to be long endured by a logical Assembly. The State may conceivably pay for the teaching to those who like to learn them of mere harmless absurdities; it ought not to pay, and certainly will not long continue to pay, for the teaching of absurdities which, instead of being harmless, are radically wicked and demoralizing. Church and State must at once be separated, and the separation must be justified on the ground that the Church is too immoral an institution for a moral State to have fellowship with. The attitude of the Republican party towards French Catholics will be very much that of the United States Government towards the Mormons. It may not be convenient to turn them out of the country at this moment, but they will only be allowed to remain there until the time has come for dealing with them as they deserve.

In the present case, however, it is not a strange and unpopular sect that is singled out as the victim, but the Church which was till a few years ago the Church of the French Government, and by inference of the great majority of Frenchmen. Only a month or two back indeed the present MINISTER OF FOREIGN AFFAIRS spoke of the five-and-twenty millions of French Catholics. Unless M. GAMBETTA is more than ordinarily indifferent to the charge of inconsistency he must either deny the accuracy of M. ST. HILAIRE's figures, or avow that he regards those twenty-five million Catholics as so many brands whom it is given to him to snatch from the burning. Either way the prospect for France is not hopeful. If M. GAMBETTA is convinced, or is prepared to act as though he were convinced, that Catholicism, which in this case means Christianity, is now the religion of a mere minority in the country, and that it is consequently safe to declare open war against it, there is at least a possibility that he may be deceived. If he is satisfied, or is prepared to act as though he were satisfied, that, even if these wicked Catholics are still in a majority, it is the duty of the good and pure minority to do instant battle with them, there is the certainty of a severe and prolonged conflict. Neither alternative promises anything but confusion. The Church in France, be its demerits what they may, is the one institution that has come down from the past; and if it is to be violently uprooted, it must be at the cost of a revolution. The forebodings of those who warned M. THIERS that the Republic could never be Conservative will have been realized to the letter, and it will only remain to be seen whether M. THIERS was equally right in his belief that, if the Republic were not Conservative, it would cease to be.

#### THE DEADLOCK IN THE HOUSE OF COMMONS.

AN essay by Mr. FREDERIC HARRISON in the *Nineteenth Century*, on the deadlock in the House of Commons, is, like all his writings, eloquent, thoughtful, and suggestive. With the causes of the evil, which have no practical importance because they cannot be removed, Mr.

HARRISON deals but slightly; yet he is fully aware that recent changes in the constitution of the House have fundamentally affected its character. "The traditional 'House of Commons,'" he says, "came from a single social class trained in the same ideas, and having the *esprit de corps* of a governing order. It no longer has that character, and it is losing it with every change in the franchise." The consequences were anticipated by cold-blooded politicians when some years ago Lord RUSSELL, Mr. GLADSTONE, and Mr. DISRAELI were, like rival candidates for the office of unjust steward, squandering for their own political advantage the trust which had been committed to them by their employer. The process is about to be carried further by the extension of household suffrage to counties; and the zeal of local agents in claiming the franchise for lodgers will leave little room for change when, in accordance with Mr. GLADSTONE's expressed wish, the country is governed by universal suffrage. It may be hoped that Mr. HARRISON exaggerates the antipathies between the different classes who have to fight out their battles in the House of Commons. The unhealthy condition of society, and the mischievous results of the supremacy of numbers, cannot profitably be discussed, because the progress of democracy is irrevocable. It may be less impossible to improve the procedure of the House of Commons than to elevate its character. There is a model in its neighbourhood, which unfortunately it cannot be compelled to copy. "No one," says Mr. HARRISON, in reference to the Irish Land Bill, "can dislike more than I do the object and spirit of the majority in the House of Lords. But a man must be blinded by party rancour who fails to see that the Land Bill was (in method) discussed in the Lords in the way befitting a real Senate. Two sittings were given to the most vigorous, exhaustive, and acute consideration of its essential principles. The speakers were men thoroughly in earnest, intimately acquainted with the subject, and capable of giving both masterly criticism and masterly defence. No other men could get a hearing." One result of "a discussion which, in mere point of method, was a perfect model of practical business," was that clubs led by blatant demagogues demanded the immediate suppression of the House of Lords. In that Assembly, while it is still allowed to exist, freedom of debate will perhaps find its last resort. It is doubtful whether, if Mr. HARRISON is right, it will long continue possible in the House of Commons.

Mr. HARRISON rightly judges that the impediments to the conduct of business in the House of Commons are not confined to the wilful obstruction which has been practised by a small knot of members. Garrulity, vanity, and faction account for a great part of the waste of time, expressing themselves in unnecessary speeches, and in the abuse of the right of questioning Ministers. A more general cause of the inability of the House to discharge its proper duties is, according to Mr. HARRISON, the usurpation by the House of Commons of the executive power, including habitual interference with the details of administration. In this respect he holds that the House of Commons would exercise one of the worst kinds of despotism, except that it is incapable of discharging the functions which it has assumed. Its vexatious interference with the powers and duties of government is copiously illustrated; but Mr. HARRISON is mistaken when he includes private business among the distractions of Parliament from its proper work. Private Bills and opposed Provisional Orders are exclusively entrusted to small Committees, which deal judiciously with the issues submitted to them. It is not necessary now to discuss the question whether any other tribunal would be preferable. For the present purpose it is enough to say that private business never clashes with the consideration of public affairs. The practice of putting useless questions to Ministers might easily be checked by appropriate Standing Orders; nor is it probable that any proposal for the remedy of the evil which may be made in the next Session would be rejected by the House. As Mr. HARRISON remarks, the leaders of the Opposition seldom ask questions; and they would willingly restrain ambitious members belonging to the rank and file of their party from interfering with the conduct of business.

The principal changes which Mr. HARRISON recommends are the same which have often been discussed. He considers that the *clôture* or power of terminating debate is indispensable, and that it ought to be entrusted to a bureau

majority of the House. It is probable that after the failure of other schemes the experiment will be tried, with the obvious risk of limiting freedom of debate. It is, perhaps, not likely that for the present a majority would arbitrarily silence its opponents, though as the gradual degeneracy of Parliament coincides with successive extensions of the franchise, respect for the rights of political adversaries may become as obsolete at Westminster as at Birmingham. A House elected by the managers of Radical Clubs is not unlikely to imitate the spirit and practice of its constituents. It will in the meantime be in the power of an obstructive faction to compel the application of the silencing system, for the express purpose of depriving a minority of its legitimate freedom of discussion. The remedy which Mr. HARRISON thinks most likely to be effectual is the reference to Select Committees of all the matters which are now discussed in Committees of the whole House. The Committees are, by an undefined "combination of selection and lot," to be made at once competent and independent of the Government. The proposed machinery would not be easily arranged; and every Committee would be subject to the disadvantage of party division. It is customary when important political questions are referred to a Committee to provide for the representation of both parties, but to give the Government a majority of one. The result is that not unfrequently the Report is carried on a strict party division. If some of the members were selected by lot the result would be the same, for as soon as the list of members was published the nature of the Report would be confidently anticipated. The members of Election Committees were selected by lot, and consequently in the years which followed the Reform Bill the decision almost always coincided with the interests of the majority. In later times, it is true that the morality of Election Committees improved, but they were bound to decide judiciously according to the evidence. A Committee on the Irish Land Bill would conscientiously and certainly have distributed itself according to its party connexions.

If the Report of a Committee on the clauses of the Bill were to be binding on the House, a Government Bill might as well be sent to the House of Lords on the day after the second reading. If Mr. GLADSTONE had referred the details of the Irish Land Bill to a Committee including a majority of his supporters, the few provisions for the protection of the residuary rights of landlords which were inserted at the instance of the Opposition or by the House of Lords would not have been included in the Bill as reported. On the other hand, it would have been absurd to nominate a Committee which, by the operation of a ballot, might have contained a hostile majority. In either case the result would have been that the House, unless discussion were prohibited under the Standing Orders, would inevitably have revised in detail the Report of the Committee. It is not necessary to interpret incidental and fragmentary criticisms as attempts to confute Mr. HARRISON's conclusions. It is not until a detailed measure is proposed for consideration that it will be possible to form a confident opinion of schemes for restoring the efficiency of the House of Commons. Mr. HARRISON has not generally been regarded as an enthusiastic admirer of any Parliamentary system. At present his confidence seems to be reposed exclusively in the virtue and wisdom of Mr. GLADSTONE. The qualified eulogy which is bestowed on the House of Lords perhaps indicates a conviction that a true aristocracy of the wisest and best would govern States better than the multitude and its delegates. The incompetence of representative bodies must be diminished or corrected by the strictest control which can be devised in the form of regulations. In the process of alleviating Parliamentary despotism the majority will become still more absolutely despotic. An Opposition is, perhaps, more disposed to talk than a Ministerial majority which can have its own way by voting in silence. The signal will be given at the proper moment by a beneficent Minister, who perhaps greatly dislikes contradiction. When Mr. GLADSTONE, in his opposition to the Divorce Bill, first exemplified the facilities for delay afforded by the forms of the House, he scarcely foresaw the necessity of more troublesome opponents.

THE *DOTEREL* COURT-MARTIAL.

THE court-martial which has been sitting since last week to inquire into the loss of the *Doterel* seems likely to answer only an incidental purpose. The cause of the explosion is apparently beyond the reach of discovery. Whatever the motive power was, it did its work too completely to leave many indications from which its character or origin can be inferred. There is nothing to show that it was due to any Fenian agency, but on the other hand there is nothing to show that it was the work of any other agency, and in a matter of this kind suspicion is almost as alarming as certainty. If we assume an explosive machine to have somehow been secreted on board the *Doterel*, it might have led to a disaster indistinguishable from that which actually happened. Consequently, unless it can be shown that the explosion came about in some other way, the Fenian hypothesis will be just as likely as, though no more likely than, any other hypothesis. The practical inference from this state of things is simply that, if there be any precautions to be taken against designed explosions, it will be well to take them with the same care and persistence as though the loss of the *Doterel* had actually been traced to this cause. We know the kind of threats that have been uttered, and we see that something has happened which, for anything we can prove to the contrary, may have been a fulfilment of these threats. That is warning enough for reasonable men, and we cannot imagine that any petty ambition of being superior to Fenian scares will prevent the naval authorities from exercising the fullest supervision over every possible—or impossible—means by which the Fenian pledges may be redeemed.

The incidental purpose which the court-martial may be made to serve has nothing to do with any particular theory as to the cause of the explosion. Attention has often been drawn to the demands which modern ships make upon the knowledge and care of all who are concerned in navigating them. These complicated machines are full of contrivances designed to make them destructive to an enemy, but almost equally well fitted to make them destructive to their own crews. Their magazines and coal-bunkers are so many theatres of possible combustion, the safety of which is only assured by constant supervision of the ventilation which is to prevent the accumulation of explosive gases. From the captain down to the lowest sailor who can by possibility have the ventilating apparatus under his charge, the crew of the ship ought to be thoroughly acquainted with the nature of the machinery by which ventilation is provided, and with the way in which this machinery is called into use. Judged by the old standards of seamanship, this is but dull work for a sailor to be employed in, but the importance of its being well done, and the tremendous consequences that may follow upon its being ill done, are of themselves sufficient to give it dignity and interest. Knowledge of this kind does not come by chance, or even by use. It must be imparted, in the first instance, by those who are responsible for these ships being what they are. A man may as well expect to know how to take a watch to pieces without previous instruction from a watchmaker as to know all the precautions that are requisite to ensure the safety of a modern ship of war without previous instruction from the constructors from whose designs and under whose supervision she has been built. When a ship is put in commission, as much care should be taken to inform the officers and men of what has been done by her builder to guard against explosions, and what is required from them to ensure that the safeguards provided are put to their proper use, as to acquaint them with any other part of their duties. The evidence given before the court-martial certainly shows that nothing of this kind was done in the case of the *Doterel*; and though it is of course possible that the *Doterel* was in this respect an exceptional vessel, it is disturbing to find that even one QUEEN'S ship can be a problem to all concerned with her.

That this is not too hard a word to use of the *Doterel* is shown again and again in the course of the trial. One point in particular has been constantly pressed on the witnesses by the members of the court—a point, be it observed, of very great importance as regards one of the possible causes of the explosion. The foreman of Chatham Dockyard, under whose supervision the *Doterel* was fitted out, described early on the second day of the trial the

ventilating arrangements of the magazine. Later in the day the carpenter of the ship was called. He stated that he was thoroughly acquainted with the construction of the magazine, that he had examined it twice before the *Doterel* was commissioned, and that he saw no ventilators. Upon failing to find any, he spoke to the foreman of the yard; and afterwards, when the ship was at Plymouth, he spoke to the foreman afloat and to the Gunnery Lieutenant, but nothing was done, and the magazine remained unventilated. At this point the foreman of Chatham Dockyard was recalled, his evidence read over to him, and he was asked whether the ventilator described in his evidence was actually the fitting placed in the *Doterel*. He then declared himself willing to state on oath that it was—partly, apparently, on the ground that, as a ship goes on towards completion, “special draughtsmen are appointed” by the Chief Constructor to make correct and authentic “drawings of everything accomplished.” The Gunnery Lieutenant at Plymouth was then called. He stated that, on the arrival of the *Doterel* at Plymouth, he had been informed by the carpenter that no ventilating fittings had been arranged in the magazine, and had reported this to the inspecting officer. More than this, he had himself, “immediately on entering the magazine, noticed a want of ventilation.” The next witness was the foreman afloat at Plymouth. He remembered nothing of the communication made to him by the carpenter of the *Doterel*, but he contributed a very remarkable communication of his own. Several vessels of the *Doterel* class have been fitted out at Plymouth, and he believes from general knowledge and examination of the drawings that their magazines are provided with no means of ventilation. Ventilation, in fact, is a luxury reserved for larger ships. At all events, he is able to state positively that nothing of the kind is shown in the drawings. Apparently, therefore, the same drawings convey quite opposite ideas to the officials at Chatham and the officials at Plymouth. The latter are at all events of one mind upon this question. Two other foremen were called and declared that in none of the ships of the *Doterel* class fitted out at Plymouth—eleven in number—have any ventilating arrangements been fitted to the magazines. On the other hand, the leading shipwright at Chatham declared that he had himself fitted the ventilator to the magazine of the *Doterel*. Thus the conflict of testimony is in every way complete. The officials at Chatham and those at Plymouth alike base their statements on knowledge of the drawings made of the fittings of each ship as it is being built. From Chatham we hear positively that ventilation is always provided for; from Plymouth that it is never provided for. This may conceivably be explained on the supposition that at Chatham ships of the *Doterel* class are built in one way while at Plymouth they are built in another. Even in this improbable event, however, the difference should be recognized, and it should be known at once from the fact that a ship was built at one dockyard or the other that her magazine is or is not ventilated. In the case of the *Doterel*, however, this knowledge would be of very little avail. The conflict of evidence comes much nearer home. Whatever be the custom as regards the class of ship, it is stated in the most positive way that ventilators of a specific kind were fitted to the *Doterel*'s magazine, and it is stated with equal assurance that no such ventilators existed. Even if these discrepancies admit of reconciliation, it is highly discreditable that they should be there to be reconciled. Let it be conceded that it is a matter of no importance whether magazines are ventilated or not. In that case why should any examination of a ship be undertaken to ascertain the presence or absence of a wholly unimportant particular? The repetition of this process must tend to engender habits of carelessness and to leave the officials uncertain whether the inspections they are making are serious or formal. The facts revealed by this court-martial give a very unsatisfactory picture of dockyard administration. It seems to be characterized neither by unity nor method, nor even by an honest admission that these qualities do not exist, and consequently that provision has to be made for doing without them. It is not a matter for shame that the cause of the explosion on board the *Doterel* should remain unknown. What is a matter for shame is that it should be equally unknown whether an omission which might have been a cause of the explosion was or was not made in the construction of the ship.

## THE LOCAL GOVERNMENT BOARD REPORT.

THE complexity of modern administration is nowhere better shown than in the Reports of the Local Government Board. Both the elements which make up this complexity are to be found there. The multiplicity of the subjects dealt with is extraordinary, and the multiplicity of the authorities which have to deal with them is scarcely less so. Everywhere the central authority is seen to be divided between the desire to make the local authorities do their work and the fear lest, in compassing this end, it should unwittingly be led on into doing it for them. Indeed, philanthropists are constantly irritated by the delays and compromises to which this conflict gives birth; and it is hard, no doubt, to construct a theoretical justification of it. But, considering how much uncertainty there yet is, and seems likely to be for some time to come, upon some of the most important matters with which local administration is concerned, the delays may be welcomed, even if the compromises are still held to be unfortunate. It is alarming even to think of the condition the country would now be in if the suggestions which have successively found favour with sanitary and Poor Law reformers had been carried out with the vigour belonging to a strong central government. Even the natural progress of what was at the time supposed to have been sanitary improvement did much to make typhoid the household word it has now become; and, if the Local Government Board had existed fifty years ago, and had been continuously ready to guide itself and the country by the latest light for the time being, we might have succeeded in acclimatizing two or three more diseases of the first magnitude. Even the magnificent system of drainage which makes London the admiration of a sewage-troubled world is now viewed with just suspicion by every one except the members of the Metropolitan Board of Works, while for those who have the unhappiness to live in the neighbourhood of Barking suspicion has already passed into certainty. If local authorities had been as energetic all over England as they were in London, we should be universally reconsidering the disposal of our sewage. This unpleasing subject makes pretty large demands on us as it is, but at any rate the majority of the bodies which have to work out the problem need not be troubled by the thought that their former labour has gone for nothing. It is consideration, not reconsideration, that they are asked to undertake.

The Report of the Local Government Board for 1880 shows no great change in the statistics of pauperism. The expenditure for relief was slightly higher than during the previous year, as it had been in each of the preceding years. It takes some time, apparently, for trade movements to make themselves felt upon the class which supplies paupers. The prosperous years at the beginning of the last decade are not those which show the most satisfactory figures. It was not till 1877 when trade had again become depressed, that the poor-rate reached its lowest point. Since that year it has been steadily, though slowly, rising. The distribution of the cost between in-maintenance and out-relief has greatly changed during the last ten years. Under the former head the charge in 1880 was 15 per cent. greater than it was in 1871; while under the latter head it was 26 per cent. less. The evidence of statistics has not, however, completed the conversion of the Guardians. In the South-Western counties 78 per cent., and in Wales nearly 85 per cent., of the total relief is still given outside the workhouse. But for this it might be thought that there was no resisting the example of the Metropolitan Unions. In 1871 the total cost of indoor and outdoor relief was 848,507*l.*, in-maintenance taking 436,208*l.*, and outdoor relief 412,299*l.* In 1880 the sum spent in outdoor relief had fallen to 198,422*l.*; and, on the theory in favour with country Guardians, the total cost of poor relief ought to have greatly increased. Instead of this, it had fallen to 712,197*l.* It is fair, however, to say that the London Guardians have been exceptionally helped in their progress towards sound views on this subject. If they had had nothing but theory to guide them, they might not have moved much faster than their neighbours. Fortunately for the metropolitan ratepayers, a large part of the cost of in-maintenance is borne by a common fund raised from the whole of London. The Guardians of each Union have thus a direct interest

in offering "the house" to paupers. They may still in their hearts believe that outdoor relief is cheaper than in-maintenance. They would perhaps say that the difference between the words used to describe the two processes proves this, since, while the outdoor pauper is "relieved," the indoor pauper has to be "maintained." But this argument is of little worth in presence of the fact that the cost of relief is borne by the Union, whereas the cost of maintenance is borne by the common fund. The Unions which show most enlightenment upon this subject are those from which least enlightenment might, *a priori*, have been expected. The average proportion of outdoor to indoor paupers for all the London Unions was nearly 52 to 48; but in the great East-end Unions of Whitechapel and St. George's-in-the-East it was 23 to 77 and 18 to 82. The lesson to be derived from these figures is that, wherever aid is given to local rates, it should be made dependent on the adoption of some sound principle which would have small chance of finding favour with local ratepayers except under the gentle pressure of pecuniary aid. It used to be said that the indisposition generally felt towards the workhouse was largely due to the cruel separation of husband and wife which was enforced there. No charge made a greater figure in the furious indictments of which the Poor Law of 1834 was so long the object. Under an Act passed in 1876 the Guardians have a discretionary power to allow husband and wife to live together in the workhouse when either of them is infirm, sick, or above sixty years of age. This relaxation of the law has had an unexpected result. It has decreased the number of applicants for outdoor relief. "In many instances," says the Report, "old people have complained of being separated merely for the purpose of obtaining outdoor relief, as, when it has been explained to them that the law permitted them to be together in the workhouse, they declined to accept the offer."

The most interesting feature in the Poor Law side of the Report is the account given by Mr. HOLGATE, the Inspector of Pauper Schools for the London district, of the experiment which the managers of the Kensington and Chelsea school district are making at Banstead. The 600 children under their charge are housed, not as is the case with the other metropolitan school districts, in one large school, but in twenty "village homes," each standing in its own plot, with its own flower garden and playground, and forming part of a village street, with chapel, school-rooms, infirmary, and shops for industrial training. Ten of these homes are for boys above seven years of age, the other ten being reserved for girls and infants. Each of the boys' houses has accommodation for 36 children under the charge of a married couple, as father and mother of the family; the "father" being employed during the day as an industrial teacher, the "mother" superintending the cooking and management of the house. The girls' houses contain 24 children, each under the charge of a "mother." The girls take care of the infants, and are taught cooking and household and laundry work. Some of our readers may remember the excitement caused some years ago by the late Mrs. NASSAU SENIOR's attack upon the system of bringing up pauper children in district schools. After all deductions had been made for unconscious exaggeration, and for a faulty method of collecting statistics, two of Mrs. SENIOR's charges remained substantially unimpugned. The girls brought up in these huge buildings, where the employment of the best mechanical aids is a necessary part of economical management, cannot receive the kind of instruction which is calculated to fit them for the work they will probably have to do when they go out into life. The cooking appliances which are needed to prepare a dinner for 1,000 children have nothing in common with the humble grate in a poor man's cottage or a small tradesman's kitchen. If a girl learns how to manage a gas stove or the latest improvement in slow-combustion ranges—and the probability is that she will not be allowed to meddle with either—it is a hundred chances to one whether what she will have learnt will be of any use to her afterwards. This was one of the faults which Mrs. SENIOR justly found with the district schools. The other was the mixing up of orphan and deserted children—who have virtually become wards of the State, and so have a claim to be protected from bad companions, so far as it is possible for this to be done—with the children who come in with their parents for a short time, who are

usually vagrants of the lowest type, and who yet have all the influence upon the regular inmates which is given by superior knowledge of the world outside and a larger experience of life. In both these respects village homes are superior to district schools. They are small, and so admit of being worked by small appliances, and by hand instead of by machines. They are distinct from one another, and so admit of more careful grouping, according to the antecedents of the inmates. Mr. HOLGATE is evidently impressed by the objections to which he thinks that the system is open on the score of expense, and he does not seem to attach sufficient force to the weighty arguments which can be used in defence of it, even from the point of view of ultimate economy. At present the experiment is only in its infancy, but it is one that deserves to be watched with sympathy as well as interest.

#### SOME OXFORD CHAPELS.

WE hardly know any buildings more completely *an generis* than the typical Oxford College Chapel, such as the Chapels of New College and All Souls. We question whether the type referred to is to be found anywhere in England but at Oxford. As a rule, like causes produce like effects; and the circumstances of mediæval collegiate life were much the same at both Universities. But the builders at Cambridge contented themselves with the simpler plan of the unbroken parallelogram, the antechapel being formed by screening off one or two of the western bays. Even Henry VI.'s colossal chapel at King's is of the same unambitious type. It is one long hall from end to end, without aisle or transept. The side chapels are entirely external to the main walls, filling the recesses between the gigantic buttresses which sustain the vault. The Chapel of Jesus is a cruciform conventual church, adapted in the fifteenth century to collegiate use, and therefore forms no real exception. At Oxford, too, we find this simpler arrangement, as in the former chapel of Balliol, and those of St. John's, Jesus, and University; but the grander and more fully developed type was evidently the favourite, and continued to be adopted from its introduction by William of Wykeham at New College, at the end of the fourteenth century, till the beginning of the seventeenth century at Wadham, and almost its close at Brasenose. At Queen's, also, we learn from Logan's bird's-eye view, an "outer chapel" of the New College type was added in 1518 to the simple oblong chapel of rich decorated architecture finished in 1382, almost contemporaneously with Wykeham's buildings.

The plan of these buildings is, in block, that of a cruciform church, deprived of its nave, such as Merton Chapel at the present day, and of Bristol Cathedral before its recent completion. But the similarity is superficial. The western limb is no transept, but a very short nave of two bays, the apparent transeptal projections being formed by the aisles. If carried further westward to their normal length, these chapels would become churches, comprising an aisled nave and an aisleless chancel, of the common type. The superficial likeness to the arrangement at Merton, which is an unfinished building, consisting of the choir, transept, and central tower of a cruciform church, of which the nave was never built, has led some to the erroneous conclusion that Wykeham, struck with the convenience of this plan for collegiate purposes, adopted it with modifications in his chapel at New. This theory, however plausible, is completely refuted by chronology. The buildings of Wykeham's "New College," more properly "Seinte Marie College of Wynehestre in Oxenford," the fulfilment of his grand design for raising the standard of education in England, were completed when on the vigil of Palm Sunday 1386 the first warden and fellows entered on their new home. The cloisters, the last completed portion, were consecrated by Nicholas, Bishop of Dunkeld—one of Edward III.'s creatures, unrecognized by the Scotch Church—October 19, 1400. At this time Merton Chapel consisted of the choir only; nor was it till about seventeen years later that the suspended work was resumed, the transepts not being finished till 1424, when the whole was "rededicated with great pomp." The central tower is later still, dating 1448–1450. We may therefore safely ascribe the plan of this chapel to William of Wykeham. The great convenience of the spacious antechapel for the performance of the various functions, almost as much secular as ecclesiastical, of which college chapels were the appointed place in mediæval times, was self-evident. The college chapel, as Mr. Clark has reminded us, was the recognized place for meetings, acts, disputations, lectures, and even for dramatic performances. When Queen Elizabeth visited Cambridge in 1564 the *Avulularia* of Plautus and other plays were acted before her in the antechapel of King's, and that, too, on a Sunday evening. Ruggles's *Ignoramus* was performed in the same sacred precincts before her successor. There is survival of the custom even to our own day in some colleges, in the election of Fellows, the signing of leases, and the delivery of declamations on secular subjects in the chapel. Still, the incongruity between the sacred and the profane was less conspicuous when secular actions were transacted in an antechapel, separated by a screen from the chapel proper. The suitability of the plan is proved by its having been adopted successively by Chicheley at All Souls and by Waynflete at Magdalen, as well as in the already men-

tioned additions at Queen's. It was also revived at a much later date (1613 A.D.) at Wadham—that remarkable and, at first sight, almost staggering reproduction of pure Perpendicular forms and details side by side with a composition of the most debased character—where the two side arches, dividing off the aisles of the antechapel, are evidently copied from those of New, and in less completeness at Oriel; and, last of all, in 1666, in that strangely heterogeneous, but not unpicturesque, medley of the classical and Gothic styles at Brasenose. The former chapel of Exeter, built in 1624 (which has given place to Sir G. G. Scott's attractive, but somewhat tame, adaptation of the Sainte-Chapelle), a building remarkably good for its date, which we should have been glad to see preserved, had exceptionally the antechapel at the side, forming a south aisle, divided from the main body of the chapel by a row of pillars and arches.

It was a further recommendation of Wykeham's design that by this lateral extension of the antechapel the architectural effect of the western façade was greatly augmented, and the chapel assumed much greater dignity and importance than if it had terminated in a simple gable. No one can have noticed the grand effect of the west end of New College Chapel, towering above the low cloisters, or that of Magdalen Chapel from Pugin's entrance gateway, without appreciating the feeling which dictated the arrangement.

The one modern chapel in which the typical Oxford plan has been in any way attempted is that of St. John's, Cambridge. Here, however, Sir Gilbert Scott has preferred the rudimentary Merton type. The western wings are real transepts, opening into the lantern space by broad single arches, and there is a tower which would have been central if the nave had been built. The effect is stately, but, as at Merton, incomplete.

The earliest colleges at Oxford, very humble foundations, had no chapel. The members worshipped in an adjoining parish church. When chapels began to be added they were nothing more than small oratories. To Wykeham must be ascribed the introduction of the more stately ideal to which, after his time, most of the subsequently erected colleges sought to conform themselves. According to his arrangement, the two edifices essential for the common life of the society, the hall and the chapel, formed one continuous building standing end to end. At University and St. John's the chapel stands to the east of the hall, and an east window, that feature so specially dear to the English mind, was possible. This arrangement was also adopted by Hawksmoor in his stately classical design at Queen's. But in the three earlier examples of New, All Souls, and Magdalen, either local circumstances or the caprice of the designer dictated another arrangement. The chapel is placed to the west of the hall and ends in a dead wall. The absence of an east window, however, instead of being allowed to be any injury to the architectural effect, has given an opportunity for adding greatly to its internal magnificence. The end wall afforded a field for that luxuriance of tabernacle work, in which the architects of the Perpendicular period revelled, and which may be regarded as the chief glory of the style. When fresh from the carvers' hands, every niche filled with its appropriate statue, the whole glowing with colour and bright with gilding, and rich with "busy entail," few more magnificent spectacles can have been presented than the reredoses of these chapels. The whole end-wall was the reredos, and the composition, rising tier above tier from basement to roof, displayed the combined skill of architect, sculptor, and colourist, at its highest and best, in a triumph of decorative art.

But while few of our mediæval architectural works can have been more deserving of admiration than these noble chapels, few have suffered more seriously, first from brutal violence, and afterwards from well-intentioned, but almost more mischievous, restoration. The rich tabernacle work and statues which were their chief glory—and of which Wykeham had such a tender care that he specially forbade the scholars at New College to jump down violently from the hall tables lest they might endanger the images on the other side of the wall—were to the first reformers, and even more to their Puritan successors in the seventeenth century, monuments of superstition, which it was their sacred duty to tear down and destroy. Everywhere the same work of destruction was ruthlessly carried out. Not only were the images removed, but the tabernacles were so completely broken up that the whole end-wall became a hideous ruin. The fragments of the magnificent canopies were huddled into the vacant hollows of the niches, like so much rubble, and to give the mutilated building some semblance of decency the whole was neatly plastered over and whitewashed. At New College, in 1695, one Henry Cook, a favourite artist of William III., who employed him to repair the Cartoons, of which he executed the copies now in the Taylor Gallery, for the Duke of Marlborough, was entrusted with the work. It was his fancy, in complete defiance of the original design, to "represent the concave of a semi-rotunda, in which the east end of the chapel was supposed to terminate." In the centre was "the Salutation of the Virgin." At All Souls the artist employed was Robert Streater, Serjeant-painter to Charles II. "A very civil little man and lame," writes Pepys, "but lives handsomely," who is chiefly known to us by the vast allegorical painting with which he decorated the ceiling of the Sheldonian Theatre, "his principal performance," says Walpole, "but a very mean one." Pepys tells us that some connoisseurs of his day pronounced it "better done than those of Rubens at Whitehall"—an estimate he did not fully share, though "certainly very noble." In 1664 he debauched the whole end-wall of the chapel with a vast picture of the Resurrection, and did his best to spoil the fine hammerbeam roof by

stretching canvas over the rafters, painted with mock "caissons," or sunk panels. Streater's work within a quarter of a century of its execution was obliterated by Sir James Thornhill's wondrous "Apotheosis of the Founder," with its clouds and streaming draperies, descending angels and soaring souls, which has only in our own day ceased to disfigure the chapel. At the same time, figures of the Latin Fathers in sham canopied niches were painted by him between the windows. A rich Corinthian marble altarpiece was set up by Dr. Clark, and Bishop Goldwell's screen separating the chapel from the antechapel was replaced by one certainly of exquisite though inappropriate design by Sir Christopher Wren. The windows were filled with dull chiaroscuro glass, resembling those Indian-ink drawings on which our grandmothers wasted so much time, of which some remnants are, or were lately, still to be seen; and which, in our memory, darkened the whole chapel at Magdalen. These costly decorative works—so strangely does taste change—were once regarded as investing the chapel with "the affecting character of solemn simplicity"; "whatever the visitor forgets he remembers the beautiful chapel of All Souls." About the same time that Cook was covering the chapel of New College and Streater that of All Souls with their tasteless productions, Isaac Fuller was doing the same at Magdalen. With a sublime audacity, he chose the Last Judgment for his subject, with the intention, we are told, of giving to the untravelled some idea of the design and colouring of Michael Angelo's work, occupying a similar position in the Sistine Chapel; "an attempt," writes Walpole, "in which he certainly failed." Addison sung the praises of Fuller's picture, as an immortal work, in sonorous Latin verses "done to order," describing it rather as it ought to have been than as it was. It was evidently a very commonplace performance, as little to be regretted as Cook's and Streater's. Of course whatever new woodwork was added was designed in the classical style. Happily the old stalls and panelling were retained at All Souls, but, in violation of all harmony of style, a Corinthian cornice was made to surmount them.

These tasteless changes were made, as we have seen, at the close of the seventeenth century. A hundred years later the Gothic revival had set in, and the Colleges were in a hurry to undo all that their predecessors of the Restoration period had done. James Wyatt, "the destructive," was in the zenith of his popularity. First New College Chapel in 1789, and then in 1793 that of Magdalen, were placed in his hands to "bring back to the Gothic model," as far as was compatible with "the improved taste of modern times." Wyatt's operations at Oxford were less destructive than at Salisbury or Durham, and though the work was feebly done, and the greater part of it was executed in cement or "Coade's artificial stone," it was not entirely devoid of merit. We are at least indebted to him for the abolition of the huge wall-paintings which darkened and disfigured the chapels, and for the restoration of the exquisite tabernacle-work, discovered in a fragmentary condition beneath the plaster, to something approaching its original beauty of design. For the feeble imitations of groining worked in plaster, "contrary," in Mr. Cockerell's words, "to the geometrical and structural principles of the style, without model or authority," there is no defence. But ribbed vaulting was then considered essential to the completeness of a Gothic building, and as these chapels were intended to exhibit the perfection of the style as conceived by Mr. Wyatt, the old hammerbeam roofs, designed when the style was a living one, were unhesitatingly condemned as unworthy of their position, and a lath and plaster sham substituted. The west window of New College had its tracery mutilated to receive Reynolds's "Nativity" and "washy Virtues," by which it was converted into "a transparency suited to a nocturnal illumination at some public rejoicing." This coloured picture, false as it is to the true principles of architectural decoration, was considered so fine that an arch was formed in the middle of the organ to give a view of it from the altar—a puerile conceit which, we need hardly say, has been done away with in the recent admirable repair. At the same time, with all its glaring faults, Wyatt's restoration must have left both these chapels much better than he found them. Such works are not to be judged of by our present standard of taste and architectural knowledge. Wyatt, it is true, had far too little respect for antiquity. But he was not quite the "monster" it has been the fashion to call him—

Nulla virtute redentum

A vitiis.

While the sister chapels at New and Magdalen were passing through the restoration fever, All Souls happily escaped the infection. We have seen that it was universally regarded as entirely the perfection of religious art. To touch it would have been sacrilege. So it has remained to our own day, with our truer knowledge of mediæval art and higher powers of execution, to bring back Chicheley's beautiful chapel to something approaching its pristine condition. The restoration has been admirably done. Unstinted munificence supplied the necessary funds, and the most accurate taste presided over the carrying out of the work. The result has been the reproduction in the elaborately carved reredos, which is the chief feature of the chapel, of what is perhaps the more gorgeous example of mediæval tabernacle work in England. As a composition we must confess that we think it inferior to the reredoses at New College and Magdalen. In these the niches run in horizontal bands stretching continuously across the screen; at All Souls, though the niches are, as a rule, on the same horizontal level, they are divided from one another by vertical mem-

bers running from floor to ceiling, so that the whole design is broken up into long vertical stripes, set aside by aids, with no necessary connexion between them. The want is felt of strongly accentuated cornices and plinths to bind the niches together and give unity to the composition. It also suffers from over-elaboration. There are no plain surfaces left, and the eye is fatigued by the want of repose. Even the vertical members, or monials, which separate the compartments, are hollowed out into little niches containing statuette. Simple mouldings casting decided shadows would have been in every way preferable. It seems almost ungenerous to criticize a work of such splendour, carried out with such unstinted munificence; but it is not the first time that real effect has been sacrificed to over-elaboration.

Singularly enough the College was quite unaware of the treasure that lay hid behind the plaster coating, and its discovery was due to an accident. During the progress of the repair an awkward labourer thrust a scaffold pole through the plaster. A huge rent was made, and revealed the mutilated remains of a gorgeous composition of tabernacle work axed off to a general surface. It was felt at once that so glorious a work must be restored. The Chicheleian Professor of Modern History took up the matter with a zeal and determination that no coldness could quench or difficulties conquer. Earl Bathurst, once a member of the foundation, munificently undertook the whole cost of the restoration. Sir Gilbert Scott diligently pieced together the broken fragments, and made out the original design. A sufficient sculptor was found in Mr. Gellowski, a Pole of Jewish extraction, by whom, with the exception of one, the work of Count Gleichen, the whole of the statues were carved, the Warden and Fellows, we are told, sitting for the likenesses; and the work went on uninterruptedly to its conclusion. The design of this magnificent reredos, which seems to have been originally erected by the benefaction of Bishop Goldwell, of Norwich, comprises a central and two lateral compartments. The latter exhibit three tiers, each of four niches. The Crucifixion occupies the centre. Above this are two rows, each of five niches, the Doom filling the crown of the composition immediately under the roof. Immediately above the Crucifixion the niches contain the four Latin Fathers, to whom the chapel is dedicated, with St. John the Baptist in the centre. Above these come the Twelve Apostles, St. Michael occupying the central niche. The two lower tiers in each of the lateral compartments are filled with historical personages connected with the epoch of the foundation of the chapel—Henry V. and his Queen, Margaret of Anjou, John of Gaunt, Edward Duke of York, the Dukes of Bedford, Clarence, and Gloucester, Archbishop Warham, Cardinal Beaufort, and others. The first niche on the north side is appropriately assigned to a statue of the restorer of the screen, Earl Bathurst. Both in design and execution these statues are above the average. A perfectly plain panel immediately above the altar mars the completeness of the design. It is not easy to determine how it should be filled, and it is better that it should remain a little longer blank than that it should receive any inappropriate decoration. Every other part of the chapel has been subjected to a thorough restoration. The hammerbeam roof, relieved of Streater's painted canvas, once more shows its ancient pitch. The chiaroscuro windows have given place one by one to Clayton and Bell's more appropriate glass. The great window of the ante-chapel had already been filled with a design by Hardman, at the cost of the late Warden. The beautiful ancient glass of the ante-chapel, transferred from the dark chocolate backgrounds in which it had been set at a period when it seemed to be thought that a window was made, not to transmit the light, but to obscure it, has recovered its old richness and translucency. A magnificent mosaic pavement of rich marbles has been laid down in the sacristy. The stall-work and benches, somewhat plain for their position, have been thoroughly cleaned and made good. In short, the chapel now seems to want nothing but a larger resident body to worship regularly within it.

The restoration of New College Chapel speedily followed that of All Souls. This may be more rapidly passed over. The same architect, the late Sir Gilbert Scott, was employed; and, with one exception, the alteration of the pitch of the roof, the work has been executed with the good taste and fidelity characteristic of his works of restoration. Where the original pitch was so plainly indicated by the obtuse gable, it is unaccountable that Sir Gilbert Scott should have changed it. The roof, of the hammerbeam type, is, in itself, almost as perfect as a roof can be. Both in design and execution, it is quite worthy of the chapel. But the consequence of deserting the old pitch is that from the west a queer little peak, like a cocked hat, appears above the gable, while within a waste of plain wall intervenes between the arch which surmounts the tabernacle wall of the east end, and the timbers of the roof. The woodwork of the stalls is excellent, and adds much dignity to the interior, but it rises somewhat too high and interferes with the lower divisions of the windows. The organ, with its two glorious towers of white metal pipes, is a grand contrast to the petty Gothic work and peep-show arrangement of the old instrument. The stonework of the west window has been restored. It would, we suppose, be too bold a step to remove Reynolds's transparent pictures. If nothing else, they mark an epoch. We could wish that the empty niches had been peopled with statues. This has been done with admirable effect at Magdalen, and it cannot be much longer delayed at New. The restoration is manifestly in-

complete till this is done. Surely if there is no Lord Bathurst to undertake the whole, individuals might contribute one or two statues each, and so the whole series might be executed. Empty niches are as meaningless decorations as pictureless frames. At Magdalen, while the statues have been restored, Wyatt's sham plaster graining still remains. We trust that Society will not much longer delay the substitution of an open wooden roof, avoiding the mistake in the pitch made at New.

We have left ourselves small space to speak of the new College chapels which have risen in Oxford during the last quarter of a century; Mr. Butterfield's at Balliol and at Keble, and Sir Gilbert Scott's at Exeter. The chapel of Exeter, though showing the least originality, is decidedly the most pleasing. The exterior of Keble Chapel, with all its richness of detail and carefully studied parts, lacks beauty of proportion and due subordination of members. It is too tall for its length, the windows are too high from the ground, and the whole design wants repose. The western transept is decidedly ill-proportioned. The interior, with its air of subdued richness, is more satisfactory. But greater simplicity would have been equally desirable here; while more modest proportions would have rendered it more suitable to its purpose, and allowed the preacher to be audible to his congregation. No one can doubt the originality of Mr. Butterfield's invention. His designs are as far as possible from the commonplace. But his talent is an eccentric one, and, while his works excite admiration, they often fail to please. At least this is the case with his later buildings. St. Augustine's College at Canterbury, one of his earliest works, has not been surpassed by anything he has subsequently executed, and still remains his most pleasing design. Balliol Chapel, though far from being a faultless building, in its modest dimensions, simplicity of design, and restraint of ornament, is much less open to criticism than its taller and more pretentious sister.

#### ARIADNE AT NAXOS.

IT is never well to puzzle readers, and therefore we shall explain frankly and at once that Ariadne is the Hon. Auberon Herbert, and that Naxos is, locally speaking, to be found in the neighbourhood of Burley, Ringwood, Hampshire. The woes of the Cretan princess have made or marred the fortune of many a poet and painter, but we do not know that they have ever been more strikingly bodied forth—in a kind of parable or analogy certainly—than by Mr. Auberon Herbert in the letter he wrote to the *Times*, and which the *Times* printed last Wednesday. Mr. Auberon Herbert's political afflictions have not, if there be any truth in the legend which speaks him the founder of a very Conservative Club at Oxford, been altogether constant, and it is very likely that Ariadne herself had looked with favour on other youths before Theseus. But Mr. Herbert seems to have thought, as doubtless Ariadne did, that between himself and the Radical party *c'était pour toujours*. Unfortunate Mr. Herbert! He must long have been murmuring to himself one of the quotations which, in Herodotean phrase, it is not lawful to make, because they have been made so often before, and have asked, "Where is that party now?" He is in Naxos (speaking now politically), but Theseus and the ship and the crew are not. They have gone off, leaving Mr. Auberon Herbert, in his own expressive words, "a prey to a vague feeling of wonder as to what has become of the party to which he once belonged." That Ariadne herself would in the original circumstances have written to the *Times* is extremely probable; that Mr. Auberon Herbert, finding himself deserted, and his party cheerfully sailing off into the blue distance, should do so, was unavoidable. For Mr. Auberon Herbert's only method of addressing his fellow-countrymen is in the columns of the newspapers. He has wooed constituency after constituency in vain, and when he attempted to "orate" in person at the Oak of Reformation in Hyde Park, he was threatened by an unfeeling public with the Serpentine. So it is in the newspaper that he announces his woes, and speaks of Theseus and the party more in sorrow than in anger, and more in wonderment than in sorrow.

The opinions of Ariadne as to the moral and intellectual character of the crew that marooned her were probably not favourable, nor are Mr. Herbert's. He sees, it seems, among the Liberal party "many opportunists, many sentimentalists, many uninquiring adorners, many believers in pills for the earthquake, many successful prophets of coming weather, many skilful navigators of tides and currents in their downward direction, many tacticians and party organizers, many well-drilled rank and file, and many unconscious Socialists just not yet developed into coherence and logic." But he does not see many people who know their own minds or are constant to their own principles. The blasphemy against Theseus personally which follows is so terrible that we hardly like to quote it. Mr. Gladstone is described as "often feelingly alluding to his inner convictions, which seem to be invariably opposed to the measure he has in hand, and which can always be conveniently dismissed." We should rather have said that Mr. Gladstone's convictions could always be summoned at a moment's notice, and were always favourable to the measure he has in hand; but then we do not speak from the point of view of Ariadne. After some irony about Saturn, and a further description of Mr. Gladstone as "a person quite capable of making the best of both planets," Mr. Auberon Herbert ceases to wait, and wants to know. He is prepared with eleven interrogatories, which he wishes to administer to the faithless party. "Are there

any Liberal Free-traders?" is the first; and the second, "Did these Free-traders vote for the Land Court and Mr. Gladstone's other mediæval institutions?" Here it may be observed that Mr. Auberon Herbert is rather hard on mediæval institutions; but from his own point of view the hit at the departing party is just. "Which has demoralized his party at short notice most successfully—Lord Beaconsfield or Mr. Gladstone?" Which has submitted most uncomplainingly to personal government? "Which believes most in the all-embracing virtue of organization? Which cares least what it does, if it beats its rival? Which has the most defective memory for its old arguments?" &c. &c. Then Mr. Auberon Herbert wishes to know "which is to be preferred, cynicism in deceiving others or enthusiasm in deceiving oneself?" This is, of course, Number Two in the nature of a Gladstone-Beaconsfield parallel. But, by way of varying the line, Mr. Herbert wants to know whether Mr. Gladstone or Lord Salisbury finds Hiansard the most pleasant reading, and has the greatest difficulty in reconciling sharp curves with straight lines—a question which is very much easier to answer. These rather general demands, which appear to require some such interjectional reply or supplement as Mr. Micawber's famous "Hoep!" to complete them, are followed by inquiries still more pertinent and pleasing. Mr. Herbert wants to know how it happened that all the Three Hundreds and Six Hundreds simultaneously arrived at a unanimous belief in the excellence of such a complicated measure as the Land Bill. He entreates "the great party to which he has the honour to belong"—this is probably ironical, for the great party has evidently left him behind—to tell him "whether it has any clear idea whither it is going," and, obviously with a momentary return of affection, he inquires further whether that party is comfortable when it reflects what it has done. Mr. Herbert, it is pleasant to know, looks with some jealousy on the Liberal party in Saturn, which is presumably constant to the old tenets. He invites (being evidently in a state of the rankest insubordination to the party to which he has the honour to belong) more Liberal members to follow the example of Lord Lansdowne and the Duke of Argyll. And then, relapsing into the blasphemous vein before deprecated, he talks about "a state of political Roman Catholicism," "the brass calf of Birmingham," "an Act of fifty clauses, which reads like a theological work dragged up from the depths of the middle ages," &c. &c. *Notum furens quid femina*, and allowance must always be made for the natural disappointments of Ariadnes who see their companions sailing away; but Mr. Herbert is evidently sound at heart, for, as has twice been seen, he despises the middle ages. There is a celebrated period in the history of philosophy when, according to one who certainly had a right to speak, "every one was a philosopher who did not believe in the Devil." Perhaps every one who does not believe in the middle ages, and who thinks them capable of the Irish Land Bill, may still, despite a little passing spleen, call himself a Liberal.

This, however, is not the point of the matter. The point is that "notre âme parle"—we must apologize to Mr. Auberon Herbert for the unavoidably uncomplimentary formula of commendation—"et même il parle très bien." A sojourn in Naxos evidently has the effect of euphrasy and rue on the mental vision. For that the Land Act is equivalent to a flat denial of the principles of Free-trade is simply a fact. That Mr. Gladstone has made his followers at their principles is simply a fact. That those followers have given a more striking example of implicit obedience than any subjects of the Czar or tribesmen of the Old Man of the Mountain is simply a fact. The instantaneous unanimity of the Hundreds touching a measure the hearings of which lawyers and publicists of the first repute scarcely professed fully to understand after long study was certainly wonderful. The great party by which Mr. Auberon Herbert has had the honour to be deserted most unquestionably does not know whither it is going, and some at least of its members are obviously a little uncomfortable at their promenade in the dark. That envy of the Liberal party in Saturn is a well-deserved gibe; the brass calf of Birmingham is scarcely a libel on the caucus; and political Roman Catholicism is a remarkably neat and appropriate term for the present fashionable, if not orthodox, form of Liberal faith. Many, if not most, of these things have indeed been said before, but they have been said for the most part by enemies, wicked Tories, or pococurante outsiders and scoffers who have not the root of the matter in them. But there is nothing in Mr. Auberon Herbert's letter except his inconceivable disrespect to the Gladstonian Church (*extra quam nulla salus*), inconsistent with the purest Liberalism. Nobody can say that Liberals have not always held the principles which he says they have held; no one can say that the practices which he denounces have not a terrible savour of evil about them according to those principles; and though some persons may be very bold and deny the existence of the said practices, their own belief in their denial is not likely to be very strong. Never was there such an example of an elephant (this is a comparison intended specially to make up to Mr. Auberon Herbert for the injurious zoological parallel which the exigencies of quotation forced us just now to draw) making havoc of his own ranks; never had a party, after playfully leaving a faithful friend stranded on Naxos, to listen to such a painful list of accusations shouted down the wind after them. Nor, unluckily, is there much chance of their ordinal being over. The original marooners of Ariadne were soon out of hull, and there was no *Times* newspaper. It is unfortunately impossible for Mr. Herbert to carry out the plan which would evidently be

most agreeable to him, and to seek the purer and more congenial atmosphere of Saturn. The party, it is to be feared, has not heard by any means the last of him. Indeed, the most unwise advances in the direction of "forgivenesses and reconciliation" seem to have been made to him. Two Liberal Associations have recently requested the honour of Mr. Auberon Herbert's accession to their ranks. Mr. Herbert is not stern; he will forgive; but on conditions only. The Associations are to "accept a resolution that the function of the Liberal party is to widen, and not to lessen, the sphere of free action, free contract, and Free-trade." He might as well have asked them to burn Mr. Gladstone in effigy at once. The only comfort for them is that the same remarkable exercise of political judgment and logical faculty which has enabled them to make the changes which Mr. Herbert deprecates may be trusted to keep them, not, indeed, steady to those changes, but constant to the course of their great leader. Mr. Herbert is evidently wanting in that sense of the community of thought and action which great men of all times have acknowledged, though they have felt its influence in various ways. This influence has often been claimed for the services of the Church throughout the world; but M. Duruy found the same effect in the knowledge that all little French boys of a certain age and rank were at a given moment repeating the same passage of Roman history, and the modern Radical finds it in the thought that the Hundreds all over England are pledging themselves simultaneously to a measure which not a tenth of the members have read, and which not a tenth of the fraction who have read it are qualified to understand. Mr. Herbert, we say, does not feel this, nor the sweets of resting in Mr. Gladstone, nor the inspiring effects of devotion to the brazen calf of Birmingham. So the Liberal party has left him, and he is Ariadne. For him personally we have very small comfort to offer. He wants Theseus to come back; Ariadne always does. But unluckily Theseus never comes back, and we really do not know what Dionysus there is left to come to Mr. Herbert's rescue. His case is hard; but he has at least had the pleasure of giving his faithless friends a piece of his mind in a very forcible manner.

#### THE SEAMY SIDE OF SCEPTICISM.

IN the "ages of faith," as is well known, scepticism or heresy—and the two would not then have been very nicely distinguished—was regarded as the most heinous of crimes. It was an outrage alike on human society and on the Divine Ruler of the world, and on both accounts worthy of the severest punishment: a code of law more than Draconian in its severity could provide; the rack, the thumb-screw, and the stake were its appropriate doom. Nor would any well-informed and impartial student of the present day, whatever might have been the case half a century ago or earlier, dream of attributing the cruelties systematically inflicted on sceptics in the name of religion to the mere selfishness or caprice of tyranny and priestcraft. Such influences may too often have been at work; even the best and wisest laws are liable to be perverted by the folly or fault of their administrators. But speaking broadly there can be no reasonable doubt that the conscience of the Christian community was honestly outraged in those days by the avowal of unbelief or misbelief, and that the fate of a condemned heretic excited as little public sympathy or regret as the hanging of a convicted murderer now, probably less. Yet so completely has the whole tone of society, or what Mr. Arnold would call the *Zeitgeist*, changed since then, that ordinary minds in the last half of the nineteenth century find it difficult to conceive, not how there can be any excuse for scepticism, but how any one can have imagined there was anything blameworthy in it. Our representative poet has sung the praises of "honest doubt," and the temper most opposed to doubt is apt to be designated by the ugly name of bigotry. It was said truly enough half a century ago, and it is still truer now, that there seems to be a sort of atmosphere of paradox and unrest hanging around many of the ablest young men of the day, not only as to religious matters, but as to all great moral and intellectual questions. Everything that had been held to be settled for centuries is again brought into discussion. It was even one of the common reproaches hurled by its enemies against the Tractarian movement, and it was repeated by Mr. Froude only the other day, that it sprang out of the sceptical temper of the age and served to promote it, while at the same time it flung back doubters, who were pausing on the very brink of Pyrrhonism, into a blind and fanatical superstition. And there was of course a certain substratum of fact in such criticisms. The "Catholic reaction," in England as in Europe, was a recoil from the advancing tide of scepticism of the eighteenth century, and the pendulum once set moving is apt to oscillate between the rival poles of fanaticism and unbelief. But, to revert to our point, there can be no doubt that the general tendency of the age is to look on scepticism as a phase of mind innocuous, if not even honourable, in which only the blindest and narrowest intolerance can find any ground of censure. We are speaking of scepticism in the strict sense of the word, which means a state of doubt and uncertainty, not of atheism or unbelief, which is as much a state of positive conviction as its opposite. Yet what a modern writer says of scepticism would apply equally in these cases also; "it is as unmeaning to speak of the immorality of an intellectual mistake as it would be to talk of the colour of a sound." And if this

be so, it is very difficult to account for the very different feeling which during many centuries notoriously prevailed on the subject, or for the blame which religious believers still profess to attach, and can certainly cite the highest religious authority for attaching, to scepticism or unbelief as a chronic habit of mind. We find even a man so little of a dogmatist as the late Dr. Arnold denying the existence of "conscientious atheism"—that is, we presume, among those brought up believers—and maintaining that "atheism and pure scepticism are both systems of absurdity," of which the former separates truth from goodness and the latter destroys truth altogether. It is surely hard, we do not say to justify but to explain such estimates, whether in ancient or modern times, if it is really as unmeaning to talk of the immorality of an intellectual mistake as of the colour of a sound.

The fundamental point at issue clearly resolves itself into this—whether there is or is not any moral element in scepticism; if there is not it can deserve no moral blame, and conversely, if there is any ground for blame, the mistake cannot be a purely intellectual one. The writer already quoted goes on to remark that, if a man has sincerely convinced himself that it is possible for two straight lines to enclose a space, we think his opinion absurd, but do not dream of charging him with immorality. But there is an obvious difference in this respect between the nature of abstract truths, like those of mathematics or geometry, and of moral and religious truths. With the former the intellect alone is concerned, but the action of the will can never be wholly excluded from our judgments on the latter. It has been observed for instance that very often the real origin of a man's scepticism is social or political. He dislikes something in the actual state of society, he dislikes the Church as connected with it and supporting what he considers its abuses, and so comes first to hate and then to disbelieve Christianity as the religion of the Church. And again, without being prepared to endorse the sweeping indictment so commonly brought by apologists of the last century to the effect that all unbelief springs from immorality, we may admit that not unfrequently the wish is father to the thought, and a man whose moral or religious practice has degenerated catches eagerly at any plausible excuse for distrusting the authority which has become a burden to him. When therefore Dr. Arnold, whose estimate of atheism we quoted just now, adds that though sincere inquirers may be perplexed for years, or even all their life, with doubts, a good man will never go on from doubt to unbelief, and urges that speculative scepticism ought to be suppressed by the will, there is nothing necessarily unreasonable in such a view of the case, because a moral as well as an intellectual process of some kind is always involved in the transition from doubt either to faith or to unbelief. We cannot be simply disinterested in any question which affects our present conduct and our anticipations of future happiness. Whatever decision we arrive at, indeed, as well as if we determine to form none at all, there are sure to be difficulties left unsolved, such as those surrounding the whole question of the origin of moral evil, and the utmost we can do is among difficulties to choose the least. But whether to a given mind the intellectual difficulties, say of Christianity or of atheism, appear the greatest is a point which is sure to depend in part on the bent of the will. For in religious, as in political matters, or even in questions of taste, the character and formed habits of thought and action inevitably produce a certain intellectual bias which cannot fail to exert an important and not unfrequently a decisive influence on our judgments. And therefore in whatever degree we are responsible for the formation of our character, we must be held responsible for its intellectual results. Hence, again, it very rarely happens that any marked change of religious, ethical, or even political belief, is not the sign or the sequel of a corresponding change of character. It follows, of course, that intellectual error in such cases may at least connote grave moral culpability; it follows also that to cultivate a particular type of character has a direct tendency to foster or induce a particular line of thought. And thus on a broad scale the contrast between the Christian and Pagan type of character, in the early ages of the Church, was noticeable and noticed on both sides alike, and it was not difficult to predict beforehand what kind of persons were likely to accept or to reject the preaching of the Gospel. When Tertullian spoke of *testimonium animæ naturaliter Christianæ*, he was pointing to the ethical conditions or characteristics of belief in the new religion.

Moreover scepticism, whether in the generic or the more ordinary sense of the term, may spring from intellectual indolence, which is itself partly a moral fault. Sir Isaac Newton once said—no doubt in an excess of modesty—that any one who chose "to attend" could have made the discoveries he had made, and attention is the meeting point of the intellectual and moral powers. Thucydides again has reminded us of what all observation and experience too abundantly confirm, the very languid interest taken by most men in the pursuit of truth. Interest, habit, passion, custom, love of ease, dislike of change, and a hundred other coarser or subtler shades of sentiment or disposition help to affect our judgment or to disincline us from taking the trouble to form any judgment. It may be replied that such influences would tell against scepticism as well as for it, and might foster that spirit of lazy acquiescence, as distinct from faith, which Tennyson contrasts with "honest doubt." That is true in its measure; but in proportion as the moral energy was feeble, it would tell chiefly on the sceptical side, because, while the intellect perceived, as it could hardly fail to perceive, difficulties on all sides, there would be no motive sufficiently strong to force a doubter to think out

the question for himself. A man with a keen love of truth or of goodness would not rest happily till he had seen his way to some practical conclusion on the main point at issue, although he might be obliged to leave some perplexities still unsolved, but a sceptic whose moral sense lay dormant would be content to go on balancing objections and acquiesce in an otiose suspension of judgment; it would be no pain or trial to him to remain in a state of permanent Pyrrhonism. And this condition of mind can hardly be excused from blame; it springs, not from honest doubt, but from a dishonest reluctance to "face the spectres of the mind" and master them. To be "perplexed in faith" is one thing, to glory in perplexity is another. Scepticism, if we trace its etymology, implies inquiry or investigation, but a sceptic often means a person who has ceased to inquire further, on the assumption that, while the process is laborious, it can lead to no definite result. Scepticism which has passed into the Agnostic phase has ceased, properly speaking, to deserve the name; it no longer searches after truth, but has decided that truth is undiscoverable, or at least not worth the trouble of discovering. "There is nothing new, and nothing true, and it does not signify at all," is a formula as little creditable to the intellect as to the heart. It is no better intellectually than the laziest acquiescence in inherited beliefs, while it paralyzes all moral life. It has been said justly that "the only effect of error ultimately is to promote truth"; but to deny or ignore the distinction between truth and error is "to poison the wells," to undermine the only foundations of morality. It must be remembered also that conviction is a state of mind distinct from the arguments which lead to it, and not varying with their strength. It is quite possible to attain to a clear conviction based on the greater probability, or accumulation of probabilities, without having answered all the arguments adducible on the other side, and in questions resting on moral evidence it is often necessary to do so, if we are to have any convictions at all. We are not of course arguing that people should jump at the conclusions which best accord with their wishes or their immediate interest; far from it. But we do say that a moral element necessarily enters into all such inquiries, and therefore it is a mistake to say, as is much the fashion of the present day, that no moral responsibility is involved in the result.

#### REGULARS AND VOLUNTEERS.

TO those of the British public who are much given to reflecting on military matters, supposing any such to exist, there must be something almost ludicrous in the fact that, while everything which we attempt with our regular soldiers on a large scale ends in more or less complete failure, we succeed perfectly when we attempt, even for the first time, anything on a large scale with our amateur soldiers. From the Walcheren expedition down to the present day there has been hardly a military undertaking, whether in peace or war, which has not been attended by more or less bungling and mismanagement. It is true that, by sheer dint of bitter experience gained in repeated failures, we have at length reached the stage when we can despatch a small expedition against a barbarous and unarmed potentate in Abyssinia or Ashantee, and bring it to a successful termination; but we have yet to see the day when we can place even one army corps on the Continent in a condition for workmanlike action. Nor are things managed much better at home as far as the regulars are concerned, though, strange to say, whenever the Volunteer element appears upon the scene we succeed perfectly. The Duke of Wellington used to say that few generals could put ten thousand troops into Hyde Park and fewer still could get them out again. We have, however, put fifty thousand volunteers, assembled from every part of the kingdom, into Windsor Park, and have sent them home again without a single mishap. Again, we have mustered forty thousand Volunteers at Holyrood with equal precision and success. We once attempted what were called Autumn Manœuvres at Aldershot for our regulars, which manœuvres, after numerous displays of primitive, not to say startling, strategy and tactics, were eventually discontinued as having been tried and found utterly wanting in so far as their object—namely, that of conveying instruction—was concerned. We may cite, as a case in point, a cartoon which many of our readers may remember as having appeared in *Punch*, in which the Crown Prince of Prussia, then on a visit to this country, was represented as being appealed to by the Horse Guards and the War Office to show them how to move ten thousand men ten miles. The Volunteers, on the other hand, can form camps of instruction which have stood the test of years, and which, so far from falling into disrepute, appear to become more numerous and better attended every year. This comparison might be extended almost indefinitely, and, as it seems, always to the disadvantage of the regulars. The Volunteers cost a mere trifle—some half a million annually—and the public see scores of regiments of respectable strength composed of stalwart men. The regular army costs an enormous sum—say fifteen millions annually—and all we see is skeleton regiments of weedy boys. It is all very well to tell the ordinary civilian that these battalions at home are merely acting; under the new system, as feeders to those abroad, and that, if he only goes to the East or West Indies, he will see proper establishments of grown men. The ordinary civilian cannot go to the East or West Indies, and, moreover, he naturally likes to see money's worth for money spent. Last, but not least, there remains the fact that, while the

Volunteer, after some preliminary ordeal of ridicule, is now welcomed among us, the regular is still sometimes treated with but scant social consideration. It certainly appears strange that a nation which first regarded the professional soldier with aversion as a menace to constitutional liberty, then with distrust, and which even now does little more than tolerate him as a disagreeable but unavoidable necessity, should so cordially receive and encourage the amateur soldier. But none the less do we require a regular army for India and the colonies, and it is much to be feared that the growing popularity of the Militia and Volunteers is acting detrimentally on our annual supply of recruits. It yet remains to be seen whether the newly organized connexion between the line and the militia will be productive of good results; but we fear that when the novelty has worn off we shall drop back into the old groove, and have to trust to chance and the recruiting sergeant for our supply of recruits for the line.

The success which has attended the two great Volunteer reviews of this year, both as regards transport and organization, suggests the question whether we could not next year attempt something more practical and more ambitious. It is now some ten years ago, if we remember rightly, that a great military novelty was suddenly introduced in the shape of the mobilization scheme. It was ushered in with a considerable amount of parade, and was duly installed in the official army list, where it has remained ever since, an absolute dead letter, until the great majority of the public have forgotten its very existence. Let us briefly recapitulate its principal features. It consists of eight army corps, the head-quarters of which are fixed at Colchester, Aldershot, Croydon, Dublin, Salisbury, Chester, York, and Edinburgh. An army corps consists of three divisions, each division of two brigades, and each brigade of three battalions. Each division, moreover, has attached to it a regiment of cavalry, three batteries of field artillery, one reserve regiment of infantry, and a proportion of engineers, ammunition train, commissariat, and other administrative services. Besides this, the army corps has a special brigade of cavalry, consisting of three regiments, three batteries of horse and two of field artillery, ammunition train, pontoon and telegraph troops, commissariat and administrative services, such as medical, veterinary, field bakeries and butcheries, &c. We may sum up the whole for the benefit of civilian readers by saying that the total comprises about twelve hundred officers, thirty-three thousand men, ten thousand horses, ninety guns, five hundred and fifty waggons, and three hundred carts, and if marching on one road would occupy about fifteen miles in length.

Now, to assemble fifty thousand men, all infantry, for a march past in Windsor Park, and to send them home again, having left them entirely to their own resources in the matter of food, is one thing. To assemble thirty thousand men and ten thousand horses in a given spot, and to supply them with all things needful, say for one week, is quite another. It is this question of supply that has always been our weak point. It has been pointed out with considerable emphasis in more than one quarter that the success of both the Windsor and Edinburgh reviews was due principally to the fact that the War Office and the Quarter-Master-General made no attempt to grapple with it, but informed the various corps that they must make their own arrangements. But, although the military authorities may candidly avow their deficiencies in this respect, a time may come when the difficulty will have to be faced; and bearing in mind how helpless the best troops are without proper supplies of all kinds, it seems to us that every consideration of prudence and common sense alike points to the conclusion that we ought occasionally to rehearse what we may some day have to act in earnest, and mobilize one or more of our army corps occasionally. We have not the smallest doubt that we could assemble thirty thousand men and ten thousand horses at any of the eight given rendezvous, but could we feed them for a month, a week, or even a day? There are other questions besides that of mere food connected with mobilization. If we glance at the scheme as it now appears, we find the whole of the staff of the eight corps represented by expressive blanks. Let us see what the requirements under this head would be. To begin with, the headquarters of each corps requires, besides the general in command, no fewer than twenty-two staff officers, including the non-combatant or administrative element. Each of the three divisions requires twelve, each of the six brigades requires four, as does also the cavalry brigade, giving a total of nearly ninety for each corps, and about seven hundred for the eight corps. Where are all these to come from? Are they really available at any given moment, or should we, when the hour of trial came, be reduced to the old familiar plan of depriving our regiments of their best officers at the precise moment when they were most required to lead their men? We stated just now that for purposes of supply an army corps required about five hundred waggons and three hundred carts; consequently the simultaneous mobilization would create a demand for four thousand waggons and two thousand four hundred carts. Could we depend upon being able to provide these at short notice and to supply them with properly trained drivers? Again, a large proportion of the regiments forming the various corps are militia, some of whom would have to be transported from Ireland and Scotland to the South or East of England. Can we depend upon being always able to muster and transport them? In fact, the more closely the whole scheme is examined, the more points and difficulties of this nature are suggested, the only true solution being actual mobilization of a corps. If the Volunteers of the neighbouring district could be induced to join in the operation so much the better, although it

may be suspected that during our first attempt we should find quite as much as we can do to muster and supply the corps proper. The expense, no doubt, would be considerable; but surely anything is preferable to the happy-go-lucky system of leaving a most complicated, delicate, and difficult operation, on the successful performance of which our national existence may one day depend, unrehearsed and unpractised until it is too late. As the mobilization scheme stands at present it is a delusion, and some day may prove a dangerous snare.

#### PROPOSED CHANGES AT WESTMINSTER.

THERE is an old story of a child which often comes into the mind when "improvements" are threatened. "Mamma, they are always building London—will it never be finished?" was the childish remark. More than quarter of a century ago, in the first number of the *Saturday Review*, a question not yet decided was discussed as to the improvements and alterations then proposed at Westminster. Our concern on that occasion was partly with the new Palace of Parliament; and partly with the parish church of St. Margaret. Both questions are again before the public, and considering our boasted improvement in matters of taste, and the artistic influences of South Kensington, now, we are assured, so widely distributed, it is strange to find the same old arguments used for the same destructive proposals. In 1855 the south side of Bridge Street was still standing; and on the western face of the Clock Tower was a bricked-up archway. Sir Charles Barry had made a design for the completion of New Palace Yard, and from this archway a row of buildings was to extend along the line of Bridge Street to a magnificent gateway, which has never existed except on paper. From this corner gateway, with its side turrets and its high pitched roof, another line of building was to mask the Law Courts, and complete New Palace Yard; which would then have been very nearly of the same dimensions as when it was sketched by Hollar in a well-known print. Hollar's view shows a bell-tower facing the entrance of the Hall, and a gateway of very moderate size at the corner looking on St. Margaret's. The fault of the new design, as we then pointed out, lay, not in its architectural features, which were in every way commendable, but in the absence of any assignment of the proposed buildings to a definite use. No doubt only too many such assignments might have been made. Too many of the public offices were then almost homeless. But the scheme became dormant, and after some years, as if to signalize its virtual abandonment, the brickwork and the archway were obliterated, and the Clock Tower was completed. The row of houses on the south side of Bridge Street meanwhile had been removed, and the present railing and gate made on the site of Sir Charles Barry's proposed archway. The buildings on the north side of Bridge Street have, except a couple of houses at the corner, been renewed in a style which, though it does not exactly harmonize with the Palace, is not wholly incongruous. The ground opposite the west side of the Palace has been cleared and laid out as a garden; and now that the New Law Courts at Temple Bar are nearing completion, the removal of the old buildings which hide Westminster Hall is suggested. In all these plans and schemes St. Margaret's Church has played a conspicuous part. One proposal, twenty-five years ago, was to remove it to Tothill Fields; another to make it the wing of the Palace parallel with Bridge Street. We advocated its retention on its ancient site, both on archaeological and artistic grounds, maintaining that where it is, it affords a measure for the adjoining Abbey, that it need not necessarily be left in so ugly a condition, and that to remove it would be to sweep away a vast body of interesting historical associations. We were able to adduce the opinion of an authority so eminent as M. Viollet-le-Duc in support of our views, and since then Sir Gilbert Scott spoke out in the same sense. It is disheartening after all these years to hear the old arguments repeated, and to find that people who pretend to taste, and who are willing to see their opinions in print, do not scruple to advocate the destruction of so interesting and so useful a building. It is evident, however, that no such idea has entered the heads of those most concerned with St. Margaret's, and the proposal now before the public, that the churchyard should be improved, may be looked upon as a sign that for the present, at least, no scheme for the removal of the church is likely to be entertained. For their support, and for the confusion of the Vandals who desire to make capital for their destructive schemes out of Dean Stanley's memory, we may further remind the men of these latter days that the *Times* of July 30, 1868, contained a letter from the Dean protesting against the demolition of St. Margaret's Church. It is to be hoped, however, that the authorities will be careful in the zeal of their gardening projects to preserve intact the tombstones which bear inscriptions, and that they will, before raising any of them, cause a careful map of the ground to be made, so that the exact site of any grave now existing may hereafter be identified. The additional precaution which we hear is in contemplation would also be very desirable, of inscribing a transcript, if not of the whole of each inscription, at least of its names, dates, and so on, upon some portion of the fabric of St. Margaret's Church.

The origin of St. Margaret's Church is a story of times so remote that we can never now hope to see it fully told. "A theory might be put forward and strongly supported that St. Margaret's existed before the Abbey. But it is more likely that the received

story is the true one, and that St. Peter's was built in a desolate and thorny islet, before parishes existed, and while St. James's Park was in the bed of a tidal estuary. As the Abbey attained importance, and as the adjoining lands were drained, a population dependent on the monks for ghostly, and perhaps also material, comforts would gradually gather round it; and when kings came to worship in the church, and ritual observances increased, the monks would naturally be impatient of the presence of crowds of the poorer laity. Perhaps a chapel of St. Margaret, forming at first part of the Abbey church itself, was assigned to them for separate worship; perhaps as the congregation increased it was removed from the interior to the exterior of the mother building. It is easy to conjecture. We have examples of both kinds close at hand. At St. Alban's the parish church of St. Andrew stood in the north side of the Abbey church, just as St. Margaret's stands by St. Peter's. The two magnificent churches which stand in the same churchyard at Coventry were once the adjunct of a still more stately cathedral. Old St. Paul's, too, had once its satellite. At St. Helen's, Bishopsgate, on the other hand, the parishioners had a portion of the conventual church assigned to them. But on this head we have spoken sufficiently in writing upon the Arundel Church case. We very early find the parish of St. Margaret continuous with the manor of the Abbey, and have it defined as extending from the walls of London to the boundaries of Chelsea, and from what is now Oxford Street to the Thames. St. Margaret's parish has greatly shrunk since the tenth century, though it has still a population about five times as great as that of London. Perhaps the first encroachment was made when the citizens took in the ward of Farringdon Without and Fleet Street, and the church of St. Bride was built; perhaps it was much earlier when St. Clement Danes became a village between the Abbey gardens and the Fleet river. The Dean and Chapter still appoint to St. Bride's as the abbot and monks must have done from the beginning. Many parishes, as St. Martin's before the Reformation, and in the last century St. George's, St. James's, not to name others, have been carved out of St. Margaret's; and the erection by Henry VIII. of Whitehall into a separate royal manor within the ancient manor of the abbot, cut him off from the river at Westminster, as he had already been cut off by the Savoy lower down. But St. Margaret's still comprises the greater part of Hyde Park and Kensington Gardens, and Kensington, Buckingham, and St. James's Palaces. The Palace of Parliament is, we believe, reckoned in the parish, though it might possibly be shown to belong to Whitehall—that is, if Whitehall is considered a separate parish, or rather precinct. The arbitrary legislation of the Tudors and the apathy of the last century leave many such questions in doubt; but, as is well known, the church of St. Margaret has often been visited in state by the House of Commons, and is supposed to be peculiarly dependent for repairs upon the liberality of that august body.

The removal of the Law Courts building from the eastern side of Westminster Hall may or may not be an improvement, according to the way in which its details are carried out. It may or may not be possible to expose in all its simplicity the great length of Richard's hall, with its row of windows. Yet it would group well with St. Margaret's; and, by its comparatively plain outline, afford an excellent foil to the redundant ornamentation of the Palace beyond. When Sir John Soane made the designs—still extant—for Gothic courts and a new Gothic entrance to the House of Lords—which in his day stood nearly where Marochetti's unhappy statue of Richard I. is now—he did but anticipate the general verdict of our day that Gothic is the proper style for Westminster. His designs were only carried out as far as the corner of New Palace Yard, where he had already a polygonal turret to guide his eye. The rest of the Law Courts were as we now see them, a simple, dignified, and not unhandsome row of buildings, in a style which, however good it may be in itself, is singularly out of place opposite Henry VII.'s Chapel. Some classical buildings might have grouped well with Westminster Hall and the churches, and have added the picturesqueness of incongruity to the whole view. But the present Courts have no such charm, and probably no one will ever regret their removal. Sir John Soane deserves credit for some improvements in the Hall. He faced it internally with ashlar, and made fairly well-designed Gothic entrances to the Courts. Some hideous buildings within the Hall at the southern end were removed, and a very serious piece of work was, at the same time or soon after, carried out. This was the re-carving of the marvellous frieze. Few people could imagine that the eighty-four representations, so infinite in their variety, of the badges and crest of King Richard, are only imitations about fifty years old. In all probability some interesting architectural features of the western side of the exterior may be brought to light when the courts of justice are pulled away. A Norman window similar to that taken down or covered up, on the other side, may come to light. So far as we can make out by Billing's plan in Britton and Brayley's book, a row of flying buttresses exists on the western side. They would certainly form a very fine feature in the new view.

It is not quite clear what are the improvements intended in St. Margaret's churchyard. The railings between it and the Abbey precincts might well be removed or greatly lowered. A broad gravel walk to the entrance of the north transept, with its new archways, would have a handsome and imposing effect, although, remembering the hideous havoc which London carbon makes with evergreens, we cannot recommend what under other circumstances would be so congenious—namely, its being bordered

with a row of cypresses; but Lombardy poplars might take their place. The two Strand churchyards show how well other varieties of that tree can stand the air of London. It is to be hoped that the railway past Henry VII's Chapel—the shortest line of railway in the world—may be removed. If trees are to be planted they must not be allowed to obscure the view. As to the tower of St. Margaret's something, we trust, will be done to redeem it from its present condition. The most ardent disciple of the new semi-classical school cannot wish its abnormal ugliness retained. To touch Wren's western Abbey towers would be altogether a mistake; but the tower of St. Margaret's is in an entirely different position. Much might be done to improve it without complete rebuilding; and even those who still advocate the removal of the parish church, in which Caxton and Raleigh are buried, would have little left to say if the tower resembled on a smaller scale that of Magdalene College Chapel, or even that of an ordinary English country church of the better kind.

#### THE HARVEST.

IT is impossible to persuade the public that fine hot weather in the months of July and August does not necessarily ensure prolific crops of corn. It appears to be still requisite to repeat what has been so often said, that all that the finest weather in those months can effect is to bring to maturity in the best condition the crop whose utmost yield has been determined by the circumstances of the preceding months of its growth. It is no doubt true that unfavourable conditions of weather in July and August can materially diminish the yield; but the finest weather, it is also obvious, cannot produce an additional stalk or grain of corn, nor repair any damage or injury which the actual stalks or ears may have previously received. Thus, while the value of sun-heat in July and August is constantly overrated, so, on the other hand, the panic which occurs when frequent rains fall and low temperatures prevail in these two months is often not justified. It is not considered sufficiently that there are farming interests apart from those of the corn-growers. For instance, in the present year, it is most difficult to form a just estimate of the consequences of the untoward and unseasonable weather which set in at the end of July. While it has done mischief, and mischief which is irreparable, to the corn crops, yet it is an incalculable gain that the country has been saved from the threatened drought, that the pastures and grasses, which were dried up and brown, are now clad in rich green, and yielding abundant feed, and that the root crops, which as to some descriptions threatened total failure, have made a very vigorous growth; so that, if the country be now blessed with a few weeks of fine dry weather, it may even yet be found that the damage done by the late rains to the corn will have been balanced by their good effects on the grass and root crops. For it must be remembered that, as to quantity of acres, the grazing interests far outweigh those of the corn-growers. The returns show that there are in the United Kingdom under corn of all sorts little more than 10½ millions of acres; while there are under roots and green crops and in permanent pasture nearly 37 millions of acres. It is true that Ireland, which contributes heavily to the latter total, cannot, as a rule, have too much sunshine; but even in the Green Isle we have read this year of pastures that were as dry and hard as a turnpike road. In Great Britain grasses and pastures constitute six-tenths of all the land under cultivation.

Our most important crop by far in acreage is our grass crop. Let us then, in the first place, inquire what its produce has been. The reply that is to be found in all the reports is that a very small crop of hay of excellent quality has been secured at a proportionately small outlay on the labour employed in making and gathering it. There have been none of the deplorable losses that have been common in late years, by reason of the crop having been spoiled while lying cut, or even by being bodily carried away by floods. But the really important gain on the grass lands is to be found in the fact that the pastures are recovering from the disastrous effects of the very wet summer of 1879. That year appeared to alter the character of the herbage. The persistence of wet encouraged the growth of the poor, hard, rank water-grasses, which obtained possession of the soil, to the exclusion of the grasses which are valuable for feeding. The growth of these coarse grasses was the cause of uncounted loss to graziers; and it is one of the hopeful elements of the future that farmers have been able to eradicate the useless grasses, or have seen them disappear, and that their pastures are reverting to the more profitable herbage. Before the advent of the ruin it was once more observed, as it has been in former hot summers, that, even on the apparently brown and dried-up fields, stock have unexpectedly thriven when they have been plentifully supplied with water. This year will be counted a good one by the dairy and grazing farmers, the more so as their herds and flocks have been more free from the ravages of disease, and that there is now an assured and excellent growth of green crops to carry them over the autumn months.

It is, however, doubtful, judging from the figures of the recently issued "Summary of Agricultural Returns of Great Britain for 1881," whether farmers possess a sufficient stock of animals to avail themselves of this abundant produce. The number of cattle shows little variation from the two previous years. It approaches 6 millions. It was only in the years 1874 and 1875 that this number was exceeded. In 1877 the total was less than that of

1881 by 300,000. It is to be hoped and expected that substantial increase in numbers may be seen in future returns, if the farmers can once obtain confidence that they may rely on immunity from the cattle diseases which have caused them such heavy losses. The diminution in the number of sheep is, however, very marked, and affords an index of the extent of the ravages of the "fluks," which in some cases entirely destroyed, and in others seriously diminished, our flocks in 1879 and 1880. The number of sheep returned in 1881 is 24½ millions, against about 26½ millions in 1880, and about 28 millions in 1879. There is a decrease of 7·7 per cent. as compared with 1880, and of 12·7 per cent. as compared with 1879. In 1874 the country possessed 30½ millions of sheep, so that our stock of those animals now is less by 20 per cent. than it was in that year. These figures suffice to explain the high relative price of mutton. Not the least important gain of the dry summer and spring has been the general re-establishment of the soundness of our flocks, and it is greatly to be desired that our farmers should as rapidly as may be reconstitute their breeding flocks on the scale of seven years ago. The knowledge of the short numbers disclosed by the returns should stimulate their efforts in this direction, and the prospect of abundant keep during the autumn and winter is always a powerful inducement to maintain the flock at the highest pitch. It is deplorable to observe that the crop of lambs has been less by a million than it was in 1880, and a million and a half less than that of 1879. Unhappily, many a flockmaster, who would gladly enlarge his breeding flock either by purchase or by retention of the ewes he has bred, is unable to do so by want of means, the losses of sheep-farmers having been so serious as to reduce their capital to an insufficient sum. In the interest of the consumer as well as of farmers every effort should be made to increase the annual produce of sheep. It is noteworthy that the country had last year (the returns for this year have not yet been issued) upwards of 2 millions of acres more under grass than it had ten years ago, and 1½ million of acres more than in 1874; yet we possessed in that year 200,000 more cattle, and nearly 6,000,000 more sheep than exist in this year 1881. It is clear that our pastoral wealth, as well as our pastoral revenue, has most seriously decreased. We have devoted more land to this branch of farming, yet the stock remaining on this larger area of land is less than it was on the smaller area, and the annual produce of meat from it is less. It has been thought that the unremunerative results of corn-growing had increased our production of meat, but the figures we have quoted show that the supposition is not well founded.

The delay that has been caused by the wet weather in gathering the corn harvest makes it even now impossible to arrive at any correct estimate of the result either in quantity or in quality. It is, however, certain that the crop of wheat has been much overrated, and that the yield per acre of this grain is again below an average. The series of bad crops has been so long that it has disturbed the old standard of what was known as an "average" crop, which, however, is still probably referred to for comparison by authorities. It was the consideration of the very general expression of opinion during July that our wheat-lands were destined to yield large crops which induced the reflection that hot weather in July cannot make a crop of corn unless the materials for it already exist. There was never, in fact, this year, in the view of sober observers, the promise of a large yield of wheat. The plant was defective; it was thin, because it had been injured by exposure to the severe frosts of winter without any covering of snow, which, it will be remembered, was swept off the greater part of the surface of the fields by the violent winds. When it is considered that the roots of wheat descend to a certain depth in the soil, and that the crust or surface of the soil is lifted and depressed by the alternations of frost and thaw, it is obvious that the roots of the plant must be injured, if not broken, by the movement which occurs. Probably it was for this reason that the plant did not develop. All that weather could do for the crop after the injuries it had sustained in the winter was achieved up to the end of July, when a sudden and great fall of temperature occurred. It was noticed shortly after this that rust and mildew showed themselves, with the effect of reducing the quantity of the crop, especially of the late wheats, to a very serious, but as yet unknown, extent. On thin hot lands premature ripening had occurred during the intense heat. In this year generous treatment of the soil has been remunerative. The deep and well-manured lands give the best quantitative results. Very little wheat has yet been threshed, and, where it has been, the yield has been disappointing and unsatisfactory. It is safe to say that the result in quantity is below the old standard of an average crop, but how much below it is too early to pronounce. As to the quality and condition, so great has been the damage done during the last fortnight of August that it would be mere speculation to put forward an opinion. It may be stated of a few samples threshed before the rain set in, that they were of great excellence. But the recent weather has done incalculable mischief to the quality of the grain. There has been very general sprouting, and, instead of being garnered in hard condition, the bulk of the crop will be soft, even if not sprouted, and must be kept in rick for a considerable time, instead of being available for consumption immediately. The recent rapid advance in the price of wheat has been caused by the growing conviction that the portion of our own crop which is fit for human food cannot be brought to market in consumable condition for a long time to come, added to the announcement that it has been the turn of

the United States to have an indifferent crop, and that according to various estimates the exporting power of that country will be from eight to fifteen millions of quarters of wheat less than in the last cereal year. The occurrence of the advance before any of the home crop had been sold will cause the curious result, if the weather should now become fine, and any of the crop can be secured in marketable condition, that farmers will obtain for wheat of defective quality more than they would have been paid for the crop if it had been in excellent condition. But the crisis is most serious, and a renewal of bad weather will unfit the whole of our crop of wheat for bread-making, and our barleys for brewing, and will complete the ruin of our corn farmers. France has been much disappointed in the quantity of her crop, though the quality is good, and will compete keenly with us for the diminished surplus of America. Russia will be able to send us large supplies, as there is, after a series of lean years, once more a good crop in most of the important districts of that territory. It is certain that the price of wheat will be at a much higher level for the year than we have been accustomed to of late. Potatoes, which promised great excellence, have been attacked by disease, and the ripe tubers have begun to sprout, so that the value of this crop is woefully diminished. Barley, which promised to be the best crop of the year, is much damaged, and in great jeopardy. Some has grown out, much is stained, and scarcely any has been or will be garnered in good condition. Oats will give bad results. It is certain that both bread and meat will be dear for the next twelve months.

#### MODERN INDIAN MAGIC.

THE old motto *ex Oriente Lux* will have to be revised so far as its metaphorical application goes. If we have in former days received the germs of religion, science, and learning from the East, we have repaid the obligation over and over again; for it now owes to us, among other inestimable blessings of modern civilization, railways, telegraphs, telephones, foreign bondholders, dynamite, patent-leather boots, and a more or less free press. In one particular, however, it has always been generally supposed that Asia was able to give us a long start. Magic, mystery, and astrology are regarded as the specialties of the East; but even in these branches of "occult science" it appears that India does not scorn to take a lesson from occidental professors. We had lately occasion to notice a publication entitled *The Occult World*, in which we pointed out that the sages and seers of modern India had adopted the methods, and even the idiomatic peculiarities, of New York spiritual circles. We have since received from Bombay a copy of *The Theosophist*, a periodical "devoted to Oriental Philosophy, Art, Literature, and 'Occultism,' embracing Mesmerism, Spiritualism, and other secret sciences." We are indebted for this precious publication to a scion of Hindu aristocracy, "one of the grandsons of the 'historic' Gungadhar Shastri, whose assassination in 1815 led, according to Thornton and others, to the downfall of the Mahratta Empire." This illustrious personage takes the liberty of forwarding us a "Copy of a monthly magazine which contains a contribution from my humble pen called 'Materials for a Discussion of the Merits of the Hindu and English Astrology,' corrected here and there in consonance with the original in manuscript. I hope the present made by me now will be as leniently dealt with as my other gift, acknowledged in the issue of your magazine for November 1st, 1879."

The Theosophical Society, of which the paper in question is the organ, was founded by a Mme. Blavatsky and Colonel Olcott; the first is described as a Russian by birth, though the name sounds rather Polish, and the other is said to be an American born and bred. We know that it is a weakness of our Transatlantic brethren to bestow brevet rank rather for personal peculiarities than professional services. Thus a retired grocer may be addressed as "Judge" if he have a learned appearance and judicial conversation; while an experienced magistrate, if he chance to hold himself erect and wear a close-buttoned coat, is certain to be dubbed "General." Whether Colonel H. S. Olcott's title was earned in the War of Secession or at the bar of a drinking saloon we are unable to say, but it is quite apparent from the Colonel's communications that he belongs to the "spirit medium" fraternity, and is, therefore, presumably one of the class with whom the police courts have had frequently to deal. The old Act of Parliament which makes persons who practise "palmistry" and sorcery amenable to the law as rogues and vagabonds would seem to have been framed with a special view to the repression of gipsy fortune-tellers and the like. A little extension of its powers would be useful in this country, and apparently in India too. Mme. Blavatsky's chief claim to renown is the invention of a certain Indian mystic brotherhood, who have inherited the wisdom of the ages, and who express themselves in choice American, and, though invisible, spend their leisure in producing raps, flowers, and tea-cups, after the approved manner of the disembodied spirits of modern American necromancy.

The natural impulse is to laugh at such folly; but when two unscrupulous adventurers not only try to pass off upon our Indian fellow-subjects ridiculous balderdash as the learning of the West, but pander to disaffection by openly attacking Christianity and its professors, it is time to consider whether the salutary rules which regulate the vernacular press in India may not be so far extended as to impose some limits on this propaganda of the gospel of tom-

foolery. *The Theosophist* is full of translations from the works of ancient "theurgists," of "spirit communications," and of blatant nonsense of all kinds, flavoured with the pseudo-science and second-hand archaeology which distinguish "trance lectures" and the utterances of "materialized spirits." Our old friend Zadkiel, too, has a good word said for him, our correspondent's article dealing seriously with a comparison of the merits of Hindu and European astrology. "*Omne ignotum pro magnifico*" is a trite adage; and we dare say that all this rubbish presents itself to the Hindu mind as serious Western lore, just as the average European seems to imagine that Persian literature consists of a few love songs of an exaggerated hyperbolic style, and that the religion of Hindus and Buddhists is an unreasoning worship of stocks and stones. "The grandson of the historic Gungadhar Shastri," the admirer of Zadkiel's astrology, is not, we hope, a typical representative of the native educated Indian; but the effect of the American-Indian Society to which he belongs, and in whose journal he publishes his astrological twaddle, can hardly exert a wholesome influence upon his compatriots.

One of the pet theories of *The Theosophist* appears to be the prevalence of crime amongst the Christian clergy, and in order to support this thesis the editor has ransacked the police and law reports for various unsavoury scandals and isolated instances of those "black sheep" whose presence in every fold is proverbial. An advertisement of some "Unanswerable Anti-Christian Tracts," by Mr. Charles Bradlaugh, also shows the tone and sources of inspiration of this curious publication.

Works on magic are apt to be disappointing; M. Lenormant's "*Chaldean Magic*," for example, instead of being, as one might be led to expect, a treatise on the art of raising demons and influencing the powers of nature, is nothing more than a series of invocations to Assyrian deities and prayers for the prevention of disease. The learning of the Magi, in fact, seems, after all, to have been a rather "one-horse affair." A more recent writer on the black art, Eliphas Levi, does indeed give some recipes for calling up the foul fiend; but the ingredients he mentions as necessary, including portions of a child murdered under atrocious circumstances, are, as he says, *cases difficiles à procurer*. M. Eliphas Levi is, by the way, represented in the number of *The Theosophist* which is before us by an authoritative description of "a suicide's after state." This document falls far short of the treatment of the same subject by a well-known member of the Norfolk Circuit Bar, who, addressing a jury for the prosecution of a person charged with attempted suicide, explained that by the law of England suicide was self-murder. "Indeed, gentlemen," he continued, "had the prisoner succeeded in his wicked attempt, he might now have been arraigned before you on the capital charge." If our American theosophists would content themselves with introducing into India the improved methods of magical science which Poussin, Robert Houdin, Connus, Dübler, and the rest of the European conjuring fraternity have invented, they would at least have contributed something to the entertainment of their less-enlightened fellow-men. But, as it is, a clumsy attempt has been made to spread the false and pernicious doctrines of "Spiritualism" among the too impressionable inhabitants of India, and to bolster up the balderdash with pseudo-Oriental learning, which will not bear for one moment the test of scholarly criticism. The more legitimate kind of Indian magic is usually much overrated. The "mango trick," for instance, as described by Anglo-Indian travellers, has been always recognized as the most perfect achievement of the conjuror's art. A "native" will enter the "compound" of an European official, and upon the gravel-covered ground will produce from under a miniature tent a mango plant, in its various stages of development from seed to fruit. The "basket trick" is equally famous, and many eye-witnesses have testified how a girl or small boy has been covered with a basket, from which, when the performer has savagely run a sword into it, blood copiously flows; the basket is then kicked over, and found to be empty, while the supposed murdered infant immediately appears from behind the spectators, and hands round the Hindu equivalent for the hat. The snake-charmers are also a renowned body of men, and many are the weird tales told of their skill in luring cobras from their holes by the power of music, and of handling the deadly reptiles with impunity. More recent investigations by experts have proved these tricks to be of the most ordinary kind. The European conjuror looks with envy on the convenient but primitive costume of a loin-cloth which his Oriental confrère wears, and sighs at the thought of the more limited capacities of his own dress-suit for the accommodation of botanical specimens. The Indian magician, on the other hand, would be only too glad to possess the improved basket of Colonel Stodare and his successors. As for the snake-charming, the fact that the last troupe of Indian magicians who visited this country took their *thanatophidia* to the Zoological Gardens in Regent's Park to get the fangs of their serpents extracted throws some light upon that branch of science. It is, nevertheless, true that snakes are peculiarly susceptible to music, and a half-witted countryman in Devonshire was some years back severely injured by an adder who had danced out of a wood too readily to the music of the yokel's inviting flute. Man is naturally prone to superstition, and in his earlier stages of culture will invent the strangest theories to account for the phenomena which he sees around him. From this point of view the most childish beliefs and grossest superstitions are interesting subjects of investigation when they are known to be "popular"—that is, to be the genuine

outcome of a people's intellectual growth. But popular superstitions which are invented and fostered by impostors and adventurers for fraudulent ends are very different matters. So much of the old leaven of superstition is left in us that any new doctrine, however preposterous it may be, is sure to find adherents; and even scientific men, in their keen search after truth, are willing to investigate the "experiments" of the most impudent charlatans. The spread of education, however, and the consequent advance of popular common sense, is a sufficient antidote to this in European countries; but we shall be grievously neglecting our duty if we allow such trash to be circulated in India under the name of science and "theosophy."

#### THE NATIONAL LAND LEAGUE.

ON Monday last the National Land League of Great Britain met for the first time in Convention at Newcastle-on-Tyne. Like most things of Irish origin, the Convention and the League appear to be very oddly named. The National Land League of Great Britain might be supposed to have something to do with the land of Great Britain, and with British Nationalists. Apparently, however, it has nothing at all to do with them. The National Land League of Great Britain is an elaborate arrangement for drawing subscriptions from England and Scotland, and paying them over to Ireland; at least, such is the inference to be drawn from the statements made at the meeting. All that Great Britain has to do is to pay, to admire, and perhaps at some date more or less distant to imitate, but the imitation is postponed. The bright particular star of the Convention was to have been Mr. Parnell, but Mr. Parnell has found the occupation of devising fresh epithets of the substantive-adjective kind for Mr. Forster and Sir William Harcourt too agreeable and too popular in Ireland to abandon it. A pale reflection of the great man, therefore, shone in the chair of the Convention—Mr. Justin McCarthy being once more driven by a hard fate to quit the pleasant paths of novel-writing and easy history and to play the patriot. The League, indeed, had a speaker on its side and in its presence who is a speaker of a calibre very different from Mr. Justin McCarthy's. That agreeable historian, whose chief political function is in some mysterious manner to "draw" the present Prime Minister whenever he speaks in Parliament, declined to interpose between the audience and a great orator. The great orator, Mr. Joseph Cowen, spoke, and it may be suspected that the Irish part of his audience were rather disappointed with him. Mr. Cowen's sentiments, indeed, were all that could be desired, but they were expressed in language scarcely sufficiently peppered to please the hearers who hang upon the lips of Mr. Healy, Mr. Sexton, and Miss Anna Parnell. There was nothing about the wolf-dog of Irish vengeance; holy dynamite was spoken of rather with apologetic disapproval than with anything else; and Mr. Forster was argued with instead of having substantives tacked to his name, tin-kettle-and-dog fashion. If we may venture to attempt an exercitation in the inimitable style of Irish patriotism, it may be suggested that many a listening Irishman must have gone away sighing to find that the brightest jewel in the garland of the smoky North had been emasculated by the poisonous contact of the effete and bestial Parliament of Westminster. However, there was balm in the Tyneside Gilead. Mr. Healy was there, and Mr. Barry and Dr. Commins—all tall men of their tongues and masters of metaphor. The easy transition, in especial, in which Mr. Healy remarked that the church bells were ringing, and that they—it is not clear whether the bells or the ringers were meant—would pull down landlordism, must have been a welcome relish to the Irish palate after the tamer and more consecutive rhetoric of Mr. Cowen. The oratory, like the whisky, which an Irishman loves is of the torchlight procession order, and he is not comfortable without the heat and light afforded by that style.

It was probably the depressing influence of the land of the tyrants which sobered the speakers at Newcastle. In Ireland itself the stream of eloquence has flowed full and free. It is perhaps unwise in Mr. Dillon and his friends to have established a custom of drinking "Our imprisoned brothers" in silence. A toast drunk in silence must be nearly as distasteful to an Irishman as a toast drunk (as he would himself say) dry-lipped. Mr. Dillon, however, whose state of health—victim of Saxon cruelty as he is—seems to admit of public speaking to a surprising extent, took up his parable at Dublin, and succeeded in exhibiting himself in the light of a very practical statesman indeed. Mr. Dillon, like all his party, dislikes the Land Bill as not going far enough. But, unlike some of his party, he is too much of an irreconcilable to advocate acceptance—without, of course, any gratitude—and advance notwithstanding. So he is going to retire from public life for a few months (voluntarily this time), and see what happens. What is to happen was candidly stated at about the same time by Mr. Parnell in another part of the country, in pursuance of the plan by which he is seeking to procure the return of Colonel Knox for Tyrone. The new Liberator made some very outspoken statements. The League, it seems, no longer aims at reducing rents; it aims at abolishing them altogether. That intimate acquaintance with the intentions of the Almighty which all demagogues possess enabled Mr. Parnell to inform his audience (not, indeed, for the first time) that God made the land for the tenants, and not for the landlords. It may be observed, in passing, that the not unfrequent case of a landlord who lets some of his

own land and rents some of another person's must introduce a delightful intricacy and confusion in attempts to carry out the Divine will on this hypothesis. Mr. Parnell also, as a matter of course, informed his hearers that the Irish Constitution was suspended; that hundreds of the best and noblest of the Irish race—that race may well pray to be saved from the compliments of its friends—were immured in dungeons; that Mr. Forster's Christian name was not William, but Buckshot, &c., &c. These somewhat withered flowers of eloquence, however, merely surrounded the very plain statement above given, and the equally plain statement that the people were to press on to do the work. Therefore, consciously or unconsciously, the Newcastle Convention, Mr. Parnell, and Mr. Dillon have arranged a very neat little programme for the autumn and winter. The National Land League of Great Britain is to collect as much money as possible for pressing on the work, and to get as much sympathy from extreme Radicals as may be got. Mr. Parnell is to take his coat off more than ever. Mr. Dillon is to retire from public life and look on benevolently while the work is being pressed. The object of that work is the utter abolition and total prohibition of rents. All this is quite explicit and obvious. The exact meaning of pressing on the work may, indeed, escape the notice of the incurious, and, though the story is an old one, it may be as well to tell it once more.

The policy of the Land League now consists of two separate lines of action—the one avowed, the other sometimes faintly disavowed, but none the less vigorously pursued. The avowed line is at first sight so suicidal that it is not very easy to understand it. The encouragement—but that is far too mild a word, and we ought rather to say the prescription—of refusals to pay rent has already resulted in the transference of hundreds of holdings from the tenant to the landlord, or his representative the emergency man, and is daily resulting in the transfer of more—that is to say, scores and hundreds of tenants have deprived themselves, and are depriving themselves, of the benefit of the Land Bill. That Bill, it is to be remembered, makes a remarkably handsome present to the tenant, but the present is strictly conditional on the payment of such rent as may be judicially fixed for the future and the conclusion of an arrangement with the landlord for the past. Both these things are incompatible with the present programme of the Land League. The consequence is that, as soon as the Act is set to work, scores and hundreds of tenants will see their neighbours, not merely in possession of the actual advantages conferred by it, but in many cases receiving solid sums of money as the price of those advantages. It is impossible to imagine anything more calculated to ensure a feeling of exasperation compared to which the exasperation which brought about the agitation of last year was a mere trifle. Nor is it in the least likely that the agitators themselves are blind to the fact. Some of them, at least, are not fools; many of them are perfectly acquainted with the probable working of the Act and the certain working of their own precedent provocations to resistance. All of them know their countrymen and the methods which those countrymen usually take to press on any work that may be recommended to them. It can be doubted by no reasonable man that the policy of refusing rent and allowing farms to be sold which the League has long pursued is only very remotely a direct policy. The protest against landlordism is nothing, the exasperation certain to be produced is everything. Among the numerous demerits of the Bill the ease with which it could be worked to this bad purpose was not the least, and has not been the least often pointed out. It is now certain that the Land League has deliberately chosen this weapon, which will of course cut both ways, and cause incalculable misery to its deluded partisans, but which it may well count on for the purpose of renewing the precious seed of outrage and crime which has already brought so abundant a crop.

Three interesting examples of the method of pressing on with the work which is likely in this case to be pursued have occurred during the last few days. There is no need to speak of such things as ordinary Boycotting, or as the destruction of hundreds of acres of good food for man and beast either by refusal to save it or by positive violence. The Irish peasant has had the example of confusion between what is and what is not his own set him in too high quarters for him to deserve much blame for mere crimes against property. But the other day there seems to have occurred in a town in Ireland one of the most remarkable incidents which even Ireland has recently beheld. A woman might have been seen pursued through the streets by a mob of some hundreds of men, hustled, threatened, and finally just able to reach her own house alive. The crime of this offender was having done some work for a Boycottee, and this was the way in which the chivalrous sons of Ireland punished her. Then there was the case of the unlucky old man who was dragged out of bed, who had lime flung in his eyes, and who escaped the most hideous of painful deaths—his eyeballs were literally burnt out when the body was found—simply owing to the fortunate accident that, as he was suffering from heart disease, the fright killed him out of hand. Lastly, there is the instructive story of the tenantry of Sir George Colthurst, who committed the unpardonable sin of making a bontire and dancing and drinking porter round it in honour of their landlord's wedding. It was, of course, clear that men so lost to decency ought to be punished; but the manner of the punishment in a land supposed to be under civilized and orderly government is, to say the least, remarkable. A party of men with blackened faces, and fully armed, surrounded the recreants, and simply poured a volley into them, finishing up with sticks. This story is, like the last, almost incredible; but we have seen no con-

tradition of it, and the softened version last published admits that at least one bullet found its billet, and at least four other persons were severely thrashed. The three together show what is likely to be the state of Ireland during the winter, when the Land League will have at its disposal, not, as it had last winter, comparative hives and men in actual possession of their farms, but experienced rioters, encouraged by months of impunity and enraged in many cases by expulsion, without hope of relief by the Land Bill, from their homes. This is the war in which Englishmen and Scotchmen are invited by Mr. Cowen to help, and this is the war against which the Government will have to make head. Their success last year is, of course, a very encouraging omen of their success this year.

#### THE LONG VACATION.

THE best thanks of the Bar, at least of the working and junior portion of it, were due to Mr. H. Fowler for his recent attempt to obtain by means of the new Judicature Act some modification of the present inordinate legal holidays, notably of that effete institution the Long Vacation, which is now dragging its slow length along. On a modest proposal to reduce this period of more than three months' enforced laziness by a fortnight, Mr. Fowler was beaten by a majority of eight. It was, perhaps, too much to expect that the House of Commons, which has known so little rest throughout the whole of a preternaturally protracted Session, should look with a favouring eye upon any proposition designed to curtail holidays of any sort whatever; but Mr. Fowler has obtained a pledge from the Attorney-General to bring the matter before the proper authorities and to give his support to some arrangement calculated to allay the existing dissatisfaction. This is something, and perhaps the result may be even more satisfactory in the end than the abbreviation of the Long Vacation by one short fortnight; but we are unable to appreciate the ground on which Mr. Fowler's suggestion was presumably opposed and negatived. It was said that the judges had accepted office on certain terms, one of which was that they were to be entitled to certain specified vacations, like a housemaid who, on taking a situation, stipulates for so many Sundays out, and that it would be discourteous to them to interfere with those vacations without first consulting their lordships. This idea appears to us as fallacious as that of the "original compact." Judges take office well knowing that their tenure is subject to alteration at the hands of Parliament; and, owing to the numerous deaths among the occupants of the judicial bench of late years, a very large proportion of the existing staff of judges have been appointed since the passing of the first Judicature Act, which was always supposed to have sounded the knell of the Long Vacation; though, like many other abuses, it has been long in dying, and even now shows signs of lingering vitality—if, indeed, a thing so deadly-lively can be said to have any vitality in it. Moreover, we think the greater courtesy to the judges would have been to presume them willing to undertake any reasonable amount of extra work which was shown to be necessary in the public interest. Mr. Warton's epigrammatic and sweeping aspersion on the judges, that "they came late, lunched long, tried slowly, and rose early," may be very clever, but it is scarcely justified by fact; judges, as a rule, work very hard when they are at it, and it is only necessary to name Baron Huddleston to have an instance of a judge fulfilling his own duties and those of a brother judge, practically at the risk of his life. Mr. Justice Cave, again, has not hesitated to devote six days a week to getting through the business which devolves upon him as the only judge in town, and Mr. Justice Williams has shown readiness to come to his aid. So it is scarcely fair to represent the body of judges as stickling, like lazy journeymen, for the smallest amount of work and the largest amount of pay. And if the judges are content to cede some portion of the seventeen weeks out of the fifty-two during which legal affairs are at a standstill, to whose interest is it to maintain the existing period of lethargy? Not to the interest of the suitors, assuredly; they suffer in every way. Plaintiffs are kept out of their rights, defendants have the terrors of an action hanging over them, both sides have to refresh the minds of their counsel before they can recall the details of briefs cast aside for the Vacation, and the impossibility of getting anything done while the Courts are up forces many a settlement in which the advantage is not always on the same side as the right. Then it must be the legal profession which craves for rest to this extraordinary extent. There is no reason, at any rate, why the solicitors should do so. Solicitors are gregarious animals, and usually hunt in couples at least, and the members of the firm might perfectly well arrange to take reasonable holidays at different times, so that one should be always grinding at the mill if grist was forthcoming. In fact, the exigencies of family business preclude the possibility of solicitors ever shutting up shop altogether; people will get married and die even in the Long Vacation, and so the cessation of contentious business means only to the solicitor a temporary falling-off in his earnings, without a corresponding amount of relaxation and freedom.

But how about the Bar? Doubtless the magnates of the profession can earn enough in the existing sittings to enable them to contemplate with complacency and even pleasure the periodical recesses which amount to a third of the whole year.

But we doubt whether they are many in number. Few men are absolutely content with that which they have; the spirit of the sailor who would still wish for a little more rum and a little more tobacco is not confined to the nautical profession; the incomes, even of the acknowledged leaders of the Bar, are not what they used to be, and the number of Q.C.'s now in town who are always just going away but never go would seem to indicate a hankering even in high quarters for some alteration of the existing state of affairs. If, however, a man, by his position, or by reason of private means, finds himself able to subsist for a year on two-thirds of a year's work, nobody can complain if he plays for the other third of the year. He may be able to eat without working, but that is no reason why he should seek to take the bread out of other men's mouths. Legal tradition assigns the largest amount of the support given to the existing vacations to those members of the Bar who are making the largest incomes, and are in a position to influence the "proper authorities" referred to by the Attorney-General, and if this suspicion be well founded a state of affairs is revealed curiously akin to Boycotting or Trades-Union tactics. To the less favoured barristers, who are dependent on their profession and have still their way to make in it, the frequent and lengthy times of inaction are a sore trial and hardship. It is bad enough when no courts are sitting; but in the Long Vacation the drawing of pleadings, the especial perquisites of the junior Bar, is practically prohibited; interrogatories cannot be delivered, or, if they are delivered, answers to them cannot be compelled; the work at judges' chambers and in the Chancery Division has by successive encroachments been cut down to the smallest possible limits, no application being entertained which does not fall within the arbitrary definition of urgency, and the penalty of dismissal with costs being imposed on the daring intruder who ventures to disturb the repose of the Vacation with anything outside that definition. Moreover, a large proportion of this work, though urgent, is of a purely formal nature, and does not necessitate the aid of counsel. And so—save for an occasional County Court summons, a little conveyancing, or the very small chance of a reference when there are no causes to be referred and no judges to refer them—there is nothing for the unfortunate barrister to do. He has even no opportunity of letting people know he is in town and eager for work; yet he must live somehow. The Long Vacation brings no exemption from the claims of butchers and bakers; the barrister and his family unhappily cannot hibernate during its continuance; indeed, in the natural course of events, expenses would be increased at this time of year by the occurrence of the annual holiday or outing which the aforesaid family might have if the head of it could earn the necessary money by staying in town. But, stay if town as he will, there is no money to be made; the Temple and Lincoln's Inn are as deserted day after day as the streets of the City are on Sunday; the wretched man sits gloomily in his chambers, like Mariana in the moated grange, waiting for the solicitor who cometh not, until, like her, he is tempted to wish that he were dead, or to don his forensic wig and gown, and, taking the wife of his bosom and his olive-branches by the hand, to parade the streets and pelt the first-floor windows with the piteous cry, "We've got no work to do."

This has been a bad year for barristers, as it has been for everybody else, and the resources of the profession were perhaps never in a condition less favourable for enabling them to tide over the interval between July and November. It is like starving in sight of plenty to see the long lists of arrears in all the courts, and know that they cannot be touched for three months, and are moreover blocking the way against new work. The condition of things is so anomalous that one marvels how it has been suffered to endure so long. Barristers and judges are not peculiarly constituted persons who require periods of rest never dreamt of by the doctor, the clergyman, or the business man. A month or six weeks at a time is holiday enough to bore most people to distraction, and the idea of a young professional man engaged in a career, success in which is proverbially slow, being debarred from making any exertions or sacrifice towards attaining that success during a third of each year would be ridiculous if it were not sad. The best that can be said in favour of the present system is that it is rendering the interests of the many subservient to those of the few.

If extra judges are necessary for sittings in Vacation, which we do not altogether believe, the expense incurred in providing them would be amply compensated by the increased rapidity with which work would be disposed of; suitors would no longer have cause to grumble, and experience would soon show that, even allowing for the absence of those lordly practitioners who might still consider it necessary to deprive the tribunals of their presence during the off season, the Bar is competent to furnish a perennial supply of leaders and juniors capable of protecting the interests of their clients.

#### THE WAR OF RATES BETWEEN THE AMERICAN RAILWAYS.

INVESTORS in the shares and bonds of American railways I have been surprised during the past couple of months by a heavy fall in the value of their property. They were less prepared for this, because the prosperity of the country rather led them to believe that railway property, if it did not continue to rise, would at least steadily maintain its value. We saw last

week, when discussing the drain of gold, that the prosperity of the United States has seldom been equalled and never surpassed; that there has been an enormous demand in Europe for grain and other produce; and that the home, as well as the foreign, trade is most active and most profitable. It was not unreasonably expected, therefore, that railway earnings would have been very large, and, consequently, that the prices would have tended to advance. As a matter of fact, railway earnings in general have been steadily augmenting, and promise to augment still further; but there has been a falling-off in what are called the trunk lines. This has been in a large measure due to the "cutting of rates." The trunk lines are those which connect the ports on the Atlantic coast with Chicago and the West. They are five in number—the Baltimore and Ohio, the Pennsylvania, the New York Central, the Erie, and the Grand Trunk of Canada. To prevent suicidal competition, these five Companies entered some years ago into what is called a "pooling" arrangement, regulating the charges each was to make for conveying goods and passengers. In very active times, when there is a full amount of business for all, it is, of course, easy to keep up this arrangement; but when for any reason the traffic falls off the arrangement is speedily broken by one or other of the parties. Last winter was the most severe that has been known in the United States for a very long time, and it was also most protracted. The consequence was that in a great part of the corn-growing regions of the North-West locomotion was for a long time suspended. When at last the frost broke up and traffic was resumed, the lakes and the canals were able to enter into competition with the railways. Thus the railways lost their usual spring traffic, and found themselves all at once obliged to divide traffic with the canals. At the same time the water competition was increased in a new direction. The improvement made at the mouth of the Mississippi by Captain Eades has permitted a considerable part of the trade that formerly flowed to the Atlantic seaboard to be directed down that river, and from New Orleans to Europe. This year this trade has assumed such large proportions that it has begun to tell upon railway traffic, since it helped to withdraw from the trunk lines a portion of the traffic which would otherwise have come to them when the frost broke up. Furthermore, the extremely severe and prolonged winter compelled the farmers of the great grain-growing States to use for fuel much of the Indian corn which they would in a more genial season have sent to the South and the East. At all times much of the Indian corn grown in the United States is consumed at home, either as food for pigs and cattle or as fuel; and during the late winter a greater proportion than usual was used as fuel, both because the severity of the winter made fires more necessary, and because it saved the transport of other kinds of fuel. In these several ways—by the long and protracted winter, the competition of the lakes and of the Mississippi, and the diminution made in the stock of grain by the consumption at home during the winter—the amount of traffic to be conveyed by the railways between Chicago and the Atlantic seaboard was decreased. The result was that some of the railways, more particularly those which have a small local traffic, underbid their competitors, so as to secure for themselves a larger share of the business going. For a while the other Companies contented themselves with complaints; but after a time they also began to reduce their rates to the level of the "cutting" lines. Mr. Fink, the Commissioner appointed to regulate the rates to be charged, called a meeting of the Directors of the Companies and reduced the rates. No sooner had he done so, however, than the system of "cutting" began again, and the several railways engaged in a bitterer struggle than before with one another to see which could outdo the other. Various attempts have been made to restore the old arrangements, but they have failed—Mr. Vanderbilt, who has control of the New York Central, steadily refusing to agree to a pooling arrangement except on his own conditions.

To what extent stock-jobbing operations may promote this war of rates we will not undertake to say; but there can be no doubt that, apart from such operations, there are very good reasons to expect the war to last for some time longer. In the first place, the severe winter has greatly damaged the crops in the North-West. As we explained last week, the United States have been favoured for four successive years by the most abundant harvests, and they have still further been favoured by the demand in Europe, owing to deficient harvests here. This year, however, it seems unquestionable that the United States harvest is a very short one. The early set-in of winter prevented the sowing of winter wheat to the full extent that was intended; and the intense cold, the heavy snowstorms, the long lying of the snow upon the ground, and the violent floods which followed, not only interfered with the spring sowing, but seriously damaged the winter wheat. The result is that the present crop is shorter than any that has been known in the United States for some years past. To estimate accurately the extent of the deficiency is impossible, since for stock-jobbing purposes very conflicting reports have been circulated. A ring in New York is endeavouring to avail itself of the attempt upon the President's life and of the war of freights to beat down prices of stocks lower than they have already fallen, and for this purpose is giving currency to the most unfavourable accounts of the probable yield of the crops; and in addition to this there is a wild speculation in grain at Chicago, and those engaged in this have an interest in magnifying the damage that has been done. But there can be little doubt that the harvest is a short one; probably we shall be within the mark if we say 20 or 25

per cent. smaller than last year. It is to be borne in mind, of course, that the increase in the acreage under wheat during the previous four years has been enormous, and that a falling-off of 20 to 25 per cent. would still leave a crop perhaps larger than that of 1878. Still the fact remains, that the crop is much smaller than was anticipated, and that, accordingly, there will not be as much grain to be conveyed to the seaboard as there was last year. It would also seem that the Indian corn crop is short. Indian corn is not exported to anything like the same extent as wheat. A very large proportion of the wheat crop is grown for consumption abroad, but the proportion of the maize crop so grown is very small. An immense proportion, however, of the crop grown in the West is consumed in the East and South, and there will be a falling-off in this traffic on the railways to the East and South. As we have said before, it is impossible to depend upon the estimates that are published of these crops; but a deficiency of 10 per cent. is probably not an exaggeration. Thus, with a smaller amount of grain to be carried, the railways have to meet the new competition of the Mississippi. Of course, the warehousing and shipping facilities in New Orleans are not at all equal to those of New York. Even, therefore, if it were cheaper to send grain down the Ohio or the Missouri to the Mississippi, and from New Orleans to Liverpool, than to send it by land from Chicago to New York and thence to Liverpool, it cannot always be done. Still the competition of New Orleans has begun to exert an influence on the railways. It seems reasonable to expect, then, that the traffic from the West to the East will be less than it has been for a couple of years back. But, on the other hand, it is not to be lost sight of that the bad weather we are experiencing now in Europe will enhance the demand for American grain. And the surplus from past abundant harvests must still be large.

But the main reason why we expect the war of rates will continue is Mr. Vanderbilt's determination not to enter into a compromise upon the old conditions with the other trunk lines, to which the New York Central is superior in every respect. The line runs through the only natural opening in the Alleghany Mountains, and consequently the grading is very slight everywhere between New York and Chicago. The New York Central is, therefore, able to work at a lower cost than any of its competitors. It has, moreover, two sets of lines each way, and is thus in a position to run a passenger and a goods train side by side both ways at once. Practically, therefore, its earning capacity is fully double, or rather more than double, that of any of its competitors. In addition, it has an enormous local traffic, it has a splendid terminal position in New York, and it has a right of way in many directions which its competitors do not possess. Mr. Vanderbilt is thus in a position to give the law to his competitors—that is to say, he is able to carry goods from West to East and from East to West at a cheaper rate than any of his competitors, and consequently he is able to continue the war of rates longer than any of them, and at less loss. But Mr. Vanderbilt asserts that by continuing the "pooling" arrangements he is enabling his competitors to increase the business of the ports of Philadelphia, Baltimore, and Boston at the expense of New York, and thereby to draw away permanently from his own line a large proportion of the traffic between the East and West. Probably he would not have continued the war of rates for this reason alone, since he must have long been aware that the whole arrangement in this respect is disadvantageous to himself, and yet it was not he who began the "cutting." But the large dividends which the several trunk lines have been distributing for the past few years have tempted other competitors into the field. Plans have been formed for establishing new trunk lines, and subscriptions from the public are invited to enable these plans to be carried into execution. Mr. Vanderbilt sees that the compromise between himself and his old competitors not only enables these to reap large profits at his expense, but also invites new competitors into the field; and as the amount of business is scarcely sufficient for the five lines which now exist, it is quite clear that it will be entirely insufficient for the larger number it is proposed to build. He has made up his mind, therefore, to nip these plans in the bud by making the public see that he has it in his power to destroy the profits of all his competitors without any serious loss to himself. It is said that at the present rates he can still pay 8 per cent. upon his own line, while many of his competitors would scarcely pay their working expenses. This is, no doubt, due to the fact that the line runs through the richest and best settled districts, especially in New York State, and that consequently he has so large a local traffic as to make him to some extent independent of the through traffic. It is probable, then, that he will continue the war of rates until the plans for constructing new trunk lines are definitely given up. And as long as he chooses to continue the struggle it must go on. Disadvantageous as is this struggle to the owners of railway property, it would seem that it ought to be favourable to the general public, inasmuch as it reduces very considerably the cost of conveying grain from the West to Europe; but, as a matter of fact, the exports of grain from the United States have not increased. Apparently the American farmers have persuaded themselves that prices must rise; that the shortness of their own crop, with the deficiency in Europe, is such as to make a considerable rise of price necessary; and they have consequently held back. How long this will last remains to be seen. We ourselves do not believe that a considerable rise of price will be maintained, and we expect that those who are now holding back will find before long that they have made a mistake. But, in the meantime, this holding

back of stock by the farmers adds still further to the difficulties of Mr. Vanderbilt's competitors. While they are carrying grain at so greatly reduced a charge they are not getting such an increase of quantity as would make up for their loss.

## REVIEWS.

### CUNNINGHAM'S BRITISH INDIA.\*

IF a Judge of the High Court at Westminster should take to writing a series of political disquisitions on disputed subjects, he might become a mark for criticism. To stir up old controversies, to mete out censure to both parties, to forecast the issue of vexed and undecided problems, would, in some quarters, be deemed incompatible with the pure and impartial administration of the law. A Judge, it would be argued, both on the Bench and off it, should be rather seen and felt than heard. But a Judge of a High Court in India is in a different position. Let him deliver justice impartially to white and black, to Anglo-Saxon, Talukdar, and tenant, and he may write and say what he likes. In fact, it is almost impossible that a man of active sympathies and liberal education should not take more than a mere judicial interest in the knotty questions which are constantly rising to the top of the vast ocean of Indian litigation. The devolution of property, the absurdities of Hindu and Mohammedan law, the influence of different systems of landed tenure on the well-being of the people, the trammels and tyranny of caste, the revelations of police-courts, the insight into agricultural life disclosed by "judicial rents" which have been fixed in Indian law courts for nearly ninety years past, the evils of deficient as well as of excessive and needless legislation, are all subjects on which we should welcome the opinion of high judicial officers, sufficiently secure by their very position against temptations to venomous and embittering controversy, and yet not too far removed from sympathy with hard-worked magistrates and oppressed but silent tillers of the soil. Many are the improvements in Indian law and administration which have been due, in some measure, to the exhaustive Minutes of Judges who have desired to improve impolitic and unwise enactments which they have yet sternly and rigidly enforced. Mr. Cunningham's present work is not as amusing as his *Dustypore*, but it is as worthy of perusal as that racy picture of life in the Punjab and the hills. Its material is taken from the best sources. The style is unimpeachable. Nothing could be better in its way than the vivid picture at p. 259, of the rise, progress, and devastation of an Indian famine after the failure of the regular rains. Huge masses of figures are admirably arranged with order and precision. As might be expected from the experience and training of the author, it is emphatically a tale about British India, reinforced by a knowledge of English literature, and written from the standpoint which we might expect in an M.P. or an Under-Secretary of State. Throughout there is an entire abstinence from those phrases culled out of the official vocabulary, so significant to the Commissioner, so perplexing to the English critic. Instead of a proverb from Sir H. M. Elliot's Glossary, or a quaint couplet in Hindi or Sanskrit current in Behar and the Doab, we have half a dozen lines from the *Agamemnon*; instead of the opinions of "crack settlement officers" we have quotations from Ricardo and the *History of Agriculture and Prices* by Rogers; and instead of anecdotes collected in the bazaar and the Tabail, we have a digest of the labours of the Famine Commission and a compendium of many instructive but shapeless Blue-books. The text is disfigured by very few errors, and even these partake more of the nature of inadequate or misleading comments than of positive blunders. In p. 125, however, the change of a single letter produces a ludicrous effect. There is, we are informed, a fund entitled "Baboo Begum's Stipend Fund." Translated literally this would mean "The Gentleman and Lady's Fund." The real reading is the Baboo Begum, an elderly female of rank, a connexion of one of the Nawabs of Bengal, who lived and died many years ago at the palace at Morshedabad. In the same place the "Nizam Stipend Fund" should be termed the "Nizam Deposit Fund." The Stipend Fund is secured by treaty and amounts to sixteen lacks of rupees. The Deposit Fund is drawn on, not for stipends but for marriages and burials and so forth, and consists of escheats and lapses from unpaid stipends of the Nawab's family and dependents. It has formed for the last forty years an unending grievance for the Nawab for the time being, as that personage would wish for nothing better than an unchecked license to squander these accumulations in a reckless and Oriental fashion. From a side-note on page 202 it might be imagined that Sutte was only put down when the Penal Code came into operation in 1860. Every Anglo-Indian is fully aware that it was abolished in the British territories by Lord William Bentinck in 1829, and that it has been discouraged in native States by warnings and manifestoes from the Foreign Office ever since this last date. From another passage (page 143) it might be apparently concluded that the Salt-tax is only fifty years old. In one shape or other it has existed for more than a century of our rule, and the Mohammedan rulers imposed

an *ad valorem* duty of 5 per cent. on the same article. We may also take exception to the remarks that the old Sikh Government of the Punjab was addicted to "crual rack-renting"; and that of all branches of our administration no part has inspired greater confidence than the judicial Courts. The opinion of the able officers who established order and law all over the Punjab after 1849 was, that the Sikh Government, though full of anomalies and abuses, by no means bore hardly upon the mass of the people, and as for our judicial Courts, they were only twenty-five years ago the very worst parts of the Anglo-Indian machine. Cumbersome laws, unsuitable procedure, decrees which, if they were understood, were incapable of speedy realization, and, with bright exceptions, Judges, who if Englishmen were pure but muddle-headed, and if natives were sharp but corrupt, formed a blot on our proceedings that defied all the efforts of reformers. It is very true, as Mr. Cunningham puts it, that of late years there has been a measureless improvement in law, simplicity of procedure, native purity, and legal knowledge. But the persons who made "a deeper impression on the native mind," or "inspired greater confidence," were of a very different type. They were administrators like the late Lord Lawrence, often in the camp, every day on horseback, and never inaccessible. They made roads, they put down gangs of robbers, and they carried out a patriarchal sort of justice which we can assure the author is no "fiction" at all; while they laid the foundations of social order and prosperity by assuring to agriculturists in huge provinces the possession of their holdings, and by fixing precisely, for a term of years, the rent or revenue they were bound to pay to the State.

We have no space to enter into the financial statistics of revenue, debt, population, temporary and occasional loans, foreign and internal trade, numbers of yards of white, grey, and coloured goods; estimates and budgets, prospective and realized, with which Mr. Cunningham's pages are filled. They will be of the utmost value to men who wish to understand British India, to appreciate the trials of our rulers and delegates, to make a speech or support a theory. What concerns us here is the general truth and accuracy of the author's review. It is an emphatic protest against the lugubrious vaticinations of such credulous sceptics as Mr. Hyndman and others. It was perhaps hardly necessary that the author, in remembrance of labours shared with others on the Famine Commission, should devote a page or two to explode the silliness of one of his colleagues' proposals for the regeneration of India. That James Caird, Esq., C.B., should, after a few months' superficial acquaintance with a most tremendous subject, gravely propose to redeem the Land-tax and to revert to payments in kind instead of money, simply proves of itself that the author of these imbecile suggestions had not mastered the beggarly elements of Anglo-Indian administration. We sometimes wonder why, in the multitude of questions now addressed to the Indian Secretary of State, some audacious member did not ask for a return showing the amount of Mr. Caird's salary and its exact equivalent in priggish advice. On the other hand, we are compelled to say that Mr. Cunningham's review of our financial and administrative position in India is somewhat too favourable. Very likely his totals of figures are correct to a fraction. In much that he urges as to our eventual and actual solvency, the lightness of taxation compared to the populousness of many provinces, the manageable proportions of the funded debt, we heartily concur. When money is wanted by the Viceroy or the Secretary of State, it can be got at a rate which now rarely exceeds 4 per cent. But, when Mr. Cunningham assures us that the Indian Government is "in the happy position of the proprietor of a vast undeveloped estate, who has only to decide to which of various schemes of profitable improvement his surplus rental shall be devoted," we at once put in a demurrer. The lot of Indian financiers of late years, with famines, wars, and half-finished works of probable utility, like the policeman's in the song, has not been a happy one. We should be more inclined to liken the Indian Government to a solvent Company which has been started to develop some valuable industry or to explore some rich mines, with but a limited margin of working capital. The ore may be there and may promise a rich dividend if it only can be got at. But, meanwhile, the capital of the shareholders has been expended in construction, wages of miners, keeping off Red Indians or other wild tribes, paying high salaries to competent engineers; and there is no ready money available to increase the steam-power, to set up the mills, to crush the quartz, and to convey the ore to the seaboard by railway or canal. Then, again, Mr. Cunningham dwells much on the admitted fact that India has hitherto been a purely agricultural country. The old native manufactories, such as they were, have died out or have been superseded by European fabrics. He admits that famines have occurred there with greater regularity and far more terrible effect than comets, inundations, or earthquakes. Since the beginning of this century there have been eleven great famines which have affected large provinces. Some part of India, he insists, suffers from famine two years in every nine; a famine of some sort or other may be expected every eleven or twelve years; and a great famine—such as that which devastated Madras in 1876-7, or Bengal in 1774—may come twice in a century. With all these averages and certainties, it seems idle to dilate on happiness of proprietorship. It is admitted further that, though Zemindars and Talukdars revel and riot in wealth, and tenant proprietors can be given security of tenure with far greater benefit to the State and to others than in Ireland, there is

\* *British India and its Rulers*. By H. S. Cunningham, M.A., one of the Judges of the High Court of Calcutta, and Late Member of the Famine Commission. London: Allen & Co. 1881.

about one million of mere labourers who exist at the very lowest level compatible with continued existence, who remain thin and hungry in times of plenty, and die off by scores and hundreds in times of dearth. But, though we recognize the gradual improvement of such classes, the rise in wages, the multiplied conveniences, the increased facilities of intercourse, which ameliorate their lot, we by no means anticipate that deserts and jungles are to blossom like the rose merely because a geological surveyor has "prospected" iron in one mountain range and coal in another. Indian coal has hitherto been unfitted for sea-going steamers unless mixed with English or Australian coal. Seams of iron have long been worked, and found to be thin and profitless; and, even if minerals can be raised at a profit, the obstacles are so many, and the disturbing agencies so certain, that we can never anticipate such a rapid and sure development of these industries as will pay for the past and provide for the future. Most experienced Governors have been anxious to encourage private enterprise in these directions, to simplify the law of contract, to prevent disputes between labour and capital, to facilitate the sale of waste lands to capitalists, and to invite individuals and Companies to complete works which the executive Government has been absolutely compelled to begin. Mr. Cunningham's view of a beneficent administration is the very reverse of all this. Government, he says, has reformed the Post-office, constructed long lines of railway, succeeded in irrigation where Orissa and Madras Companies have failed, and so, as a deduction, intending speculators ought to have no more cakes and ale. We entirely concur with him in opinion that the Indian Government, from its large field of official selection, from its ability to dispense with quick returns, and from its more thorough knowledge of the native temperament, is likely to succeed where Mr. A. and Mr. B. would probably fail. But it is quite impossible for even the best of Governments to keep a community in perpetual leading-strings, and to manage every conceivable form of industrial and commercial enterprise. It may be said with more truth that, from the days of Lord Canning, the Government has pledged itself to welcome every project of social development on the part of the independent and unofficial community which can be prosecuted with a due regard to the rights, equities, and interests of the native races.

Other reforms are suggested which can be carried out, though not perhaps in the precise shape indicated. There is room for a new administration on the scale of a Lieutenant-Governorship. The Province of Orissa would, as proposed by the author, be ill-mated with the Central Provinces, with which it has no natural connection and from which it is divided by unhealthy and inaccessible jungles. Besides, the civilization of Orissa stands on a higher level than that of a province devastated by Mahratta raids and pestilences, and still tenanted by Gonds and overrun with deer and bison. A much sounder proposal, not noticed by the author, would be to separate Behar or a large part of it from Bengal, and, with the Province of Benares and a few other districts, to form a new Government midway between Calcutta and the Upper Provinces. But in all these proposals for the remodelling of the Empire, there is invariably some corner or district which obstinately refuses to fit in with the rest; and the native community, we are bound to add, look with dismay and bewilderment at these inexplicable movements of pieces on a chess-board, which in their eyes are not reforms at all, but mere occasions of worry and vexation. That Madras, like all other Presidencies, should have Commissioners to supervise the Collectors and to become active agencies for local reform and communication with headquarters, will hardly be denied; but when we are told that "promotion by merit should be more strictly enforced" we are reminded that "merit" is occasionally very difficult to define. Doubtless this term is often synonymous with ability, vigour, and experience; but cynical men, especially bachelors, who are passed over in selection for the Board, the High Court, or the Secretariat, have been known to mutter that "merit" in the successful candidate means a musical taste, social talent, an engaging address, or an attractive and pretty wife. In his recommendations for the direction of native agriculture by a separate department of the State, Mr. Cunningham goes somewhat beyond the requirements of the native population. Possibly to a cursory view native agriculture, with its light instruments, milch kine yoked to the plough, want of rotation, and general simplicity, may appear unscientific. But there are a good many substantial proprietary tenants from whom even the Famine Commissioners might take a lesson. They know all about the lay of the land, the gradients for service of water, and the suitability of different crops, and they are not insensible to the necessity of manure for such productions as tobacco, sugar-cane, the poppy, and the better classes of cereals and pulses. And when it is said that the Indian soil requires a plough to go deep into the clay or loam, and not one that produces a series of irregular scratches first lengthways and then across the field, we may remind the authorities that no Indian ryot will use a plough which he cannot carry to and from the field on his own shoulders, or which cannot be easily repaired or constructed by the carpenter and blacksmith of the village. A model farm or two, an agricultural show with prizes for fat oxen and gigantic sugar-canes, and a Secretary or Commissioner for Agriculture, are reasonable and moderate reforms; but financial exigencies, as well as sound judgment, will prevent most Governors from recommending a regular staff of agricultural officials with "one person in each village" legally responsible for such returns. It is, perhaps, inevitable with writers who have had no practical experience of village and bazaar life that they

should want all reforms at once. But no one is readier than Mr. Cunningham to draw attention to the solid progress made since the Government was administered directly by the Crown. It has been often said that though more has been done in India since the Mutiny and the abolition of the Court of Directors than in the previous half-century, yet, without the wise and discreet old East India Directors, there would have been no country to hand over and no people to govern. And we have just seen a remarkable State paper drawn up by the Lieutenant-Governor of Bengal, Sir A. Eden, which truthfully and modestly sets forth various improvements carried out in that fine province in the exact direction recommended by Mr. Cunningham. Canals have been deepened and new ones commenced. The Burdwan and Hooghly districts, ravaged by a low kind of fever for years, have been supplied with fresh water from a river that has its source in the hills to the west; irrigation has advanced in Behar; branch railways have been completed in Tirhoot, in Northern Bengal, and between the important towns of Patna and Gaya. One new line is under construction to the south of Calcutta, and a Company has been started to carry another through a rich and densely populated neighbourhood to Jessore and beyond. If we differ from Mr. Cunningham in regard to the fitness or urgency of some of his proposals or the measure of his helpfulness, we are prepared to endorse his main conclusions. India is not irretrievably insolvent; her administration, though not a miracle of unvarying success, is a marvel of conscientiousness and ability as well as a material increment, not, indeed, to the finances of the English Treasury, but to the national credit and to the political estimation in which England is held on the Continent.

#### SINNING, OR SINNED AGAINST? \*

THE first two chapters of this long story will, we are persuaded, more than satisfy most readers. Patience can indeed do great things in carrying us through the opening scenes of a novel, but patience has its limits. A writer who is bold enough to make a great call on our memory as she introduces us to her characters ought at the same time to give us some good grounds for hoping that our trouble will not be all in vain. A reader is not like a schoolboy who can be forced to learn off by heart long lists of irregular nouns and verbs, long before he can be made to understand of what advantage the knowledge can be either to him or to any one else. Happily for those who are grown up, this is a free country, and no one can be compelled to master the genealogy of a shoal of stupid heroes and heroines. A parson when he has got us once seated under him may calmly announce that he intends to divide his discourse into three main parts, with half a dozen subdivisions to each, and a few plain practical remarks by way of a conclusion. A sense of propriety and a regard to respectability will keep us, he very well knows, from flinging open the pew-door in a panic, and from tearing down the aisle out of the church porch. But with novelists the case happily is different. Let them from the very beginning make it quite clear that they intend to bore us to death, and we and they part company at once. A book is pitched down with even less trouble than it is taken up, and a foolish novel always receives the most unceremonious treatment. The first page of the story before us was enough to raise a strong suspicion of its stupidity, for it introduced us to a truly beautiful and soothing view on a calm summer evening. The sun was setting, and of course setting in glory. The distant foliage was darkening, and the windows of an old mansion were gleaming. A river was giving a village a gentle, loving embrace, and a grey old church, like the guardian spirit of the place, seemed to watch over some trim cottages and a few more pretentious houses. The smith's forge had a bright glow within, the parsonage was pretty, the doctor's house had staring green shutters. The purple shadows of evening fell in the valley, the hills and the sky were still aglow with the sun's parting radiance, and the scene was homelike and tenderly beautiful. All this kind of thing is as familiar to us as the language of an estate agent or an auctioneer. It is the usual preliminary to a stupid story. We pass on, and we find that this village has not only a Squire's modern mansion, but an Old Manor House. Round this ancient dwelling the author at once throws an air of mystery. It stood empty, it had great staring dead-eye windows, the grounds round it were neglected and weed-covered, and by it was a lightning-seathed trunk, riven and completely bare. In it there were plenty of long passages and old nooks and corners of wasted space. It was such a house as flourished in the days of Mrs. Radcliffe, and one of these old nooks or corners plays, of course, a most important part in the tale.

So far we had had pretty plain sailing; but, when we passed from the two houses to the Squire's family to whom they belonged, then our troubles began. If the reader is daring enough to venture into all the mazes of this story, we would advise him to follow our example, and from the very beginning to make out a kind of family tree. Should he fail to do this, we are confident that he will carry in his head no clearer notion of the plot than the schoolboy, a week after he has passed an examination in English history, does of the descent of Henry VII. from Edward III. We begin with the late Squire's father's rich wife.

\* *Sinning, or Sinning Against? A Novel.* By A. C. P. 3 vols. London: Remington & Co. 1881.

He dies and she dies, and then we come to the late Squire himself, John Danvers by name, and his only brother. The Squire marries and has children, and his brother marries and has a son. The Squire's wife dies, and so do all his children but his son George. His brother dies, and, if we are not mistaken, his brother's wife dies also, leaving an only son named John. By this time we have two John Danvers. Happily the nephew becomes a clergyman, so that the reader can distinguish one as Squire John and the other as Parson John. Parson John marries and has three children, John, George, and Mary. By this time we have no less than three John Danvers on hand and two George Danvers. Happily Parson John tumbles downstairs, breaks his back, and dies in an hour. His son, however, gets ordained on the very next page, so that we have a second Parson John whom we must carefully distinguish from the first. More especially is this needful for the credit of the Church, if for no other reason, as it was reported, even after a lapse of many years, that the ghost of the broken-backed Parson John used to come out between twelve and one at night and groan for an hour at the foot of the grand staircase down which he had tumbled. We must return, however, to the time when he died and left an agonized widow, as the author calls her, and three children. George, the second son, became a dashing cornet of dragoons, and his cousin George, the Squire's only son, is also a dashing officer, but of what rank and in what branch of the service we are not told. Mary, the daughter of one Parson John Danvers, the sister of the other Parson John Danvers and of George Danvers the soldier, is soon discovered to be in love with George Danvers the other soldier, the son of Squire John Danvers. We have by this time reached the eighth page of the story, and a little variety is needed. Of Danvers, as of rabbits, there may be enough. We are introduced, therefore, to a Mr. and Miss Monkstone, who rent the Old Manor House, and give at once an agreeable air of mystery to the tale. In the first place, the father does not go to church, though his daughter does. Then they would not visit their neighbours, and of their antecedents nothing could be learnt even by the Squire's London solicitors. They had, of course, a faithful servant, Kitty Perry by name, but from her not a word could be extracted. It was in vain that the butcher's wife condescended to ask her to tea, and that the old lady who kept the grocery store walked home with her from church. When they softly sympathized with her, she put on an air of stolid indifference, and if she were actually questioned about her master she became rather nervous. The Monkstones visited no one but an elderly invalid, who had herself at one time been a mystery. The father had a worn, haggard, and wolfish expression. The daughter, to be sure, had a certain queenly carriage, and a straight nose, but her complexion was of one uniform creamy pallor, and she had no vestige of colour in her cheeks. However, poor Mary Danvers was greatly alarmed to find that her cousin George the soldier—not her brother George, the other soldier, whose opinion in such a case would not have mattered a brass farthing—looked upon her as the most beautiful woman he had ever seen. The Squire at once took alarm, and gave his mysterious tenants notice to quit at the end of the year.

By this time we have reached the seventeenth page of the story. George, the dashing young cornet, has, the author feels, hitherto been too much neglected. He visits, therefore, his maternal grandfather, and falls in love with a charming young lady, Miss Grace Courtney. As she was only just seventeen the Squire insists that the young people shall wait a year before they marry. The Squire's son George is ordered to the seat of war, wherever that may be, for no war has, we believe, been mentioned. Mary's cheek grows pale and her step loses its lightness. But she is not the only one who suffers, for in her wanderings through the Park she sees one day Miss Monkstone seated on the river bank, weeping bitterly, and passionately pressing a letter to her lips. Time wears on, and by the twentieth page Miss Monkstone falls ill; her faithful Kitty becomes broken-hearted; and her father, on more than one occasion, is seen by one Giles Brown rushing out of his house, tearing his hair, muttering to himself, and gesticulating wildly. It is by no means wonderful that the Squire's patience becomes nearly exhausted, and that he looks forward eagerly to the end of the year's tenancy. He has a good deal to go through with them, unhappy and most respectable old country gentlemen that he was, before he has seen the last of them. One day the faithful Kitty is announced by the servant as waiting below to see him, apparently in a very excited state. He is greatly perplexed, but his niece—the agonized widow of old days—suggests that Kitty shall be shown into her boudoir. On entering she behaved in a most reprehensible manner, for she sank into a chair and began to sob in a heartrending manner. Her young mistress, she at last was able to explain, was missing, while her master had fallen down in a sort of fit. The Squire ordered his carriage, and they all started for the ill-omened place. As the two houses were only about a mile apart, we do not know why the company rode, unless perchance the dignity of the story did not allow them to go on foot. Lager though the worthy old gentleman had been to get rid of his tenant, still more eager must he have been when he found him in the care of the doctor and of Giles Brown. His cadaverous visage was horrible to look at in its contortions, and he writhed his emaciated body about like one in the greatest torture, while he shrieked in agonized accents for his daughter. A search is made everywhere for the missing young lady, and her shawl and boots were found concealed in the hollow trunk of a tree by the river-bank,

where she had some months before been seen sitting in tears. It is not for many a year that her fate was discovered. Leaving her on one side, we come in a page or two more to the death of George Danvers the soldier, the Squire's son, who fell gloriously at the head of his regiment. Before we turn over the leaf the Squire has an attack of paralysis. Parson John thereupon turns up in the midst of all these troubles, and, strange to say, his first enquiry was for the Monkstones. On hearing about them he faints away, and on recovering goes down to the river bank and for hours sits by it, letting the cold February rain beat upon him. Of course a weakening lingering illness was the result of this imprudence. About this time cries, shrieks, groans, and such like were said to be heard in the Old Manor House. We have still a little comfort left in the engagement which existed between George Danvers the soldier, the parson's son, and the charming Miss Grace Courtney. But on the thirty-fifth page this comfort is taken away, for a month before the day fixed for his marriage he writes a broken-hearted despairing letter to say that his engagement was broken off and that he was starting for India. The old Squire hereupon has a second stroke and becomes quite childish. Parson John is, indeed, left us, and he certainly marries, but his wife dies in the next paragraph but one, and his health breaks down. The old Squire dies also, and with his death we reach the end of the first chapter.

The story, however, like the business of the world, in spite of mortality is carried on easily enough. Fresh characters are introduced, and old mysteries are cleared up. Miss Monkstone's skeleton is found at last, and at the same time it is discovered that she had been married to the Squire's son George, and murdered by her father in a fit of madness. This old gentleman certainly keeps up the bustle very well, to use an old stage term. In the third volume, for instance, in the belief that his granddaughter was his daughter, he sets fire to the Old Manor House in which the young lady was living, and nearly burns her to death. Happily he only kills himself. In the end an air of cheerfulness is thrown over the story, as almost every one gets married who is not married already except an elderly maiden aunt, a widowed grandmother, and an aged nurse. A vast number of babies are born, and fresh generations are provided for the author should she ever intend to carry her history still further down. Let her, however, show some mercy. Strokes of paralysis are brought on in more ways than one. Tidings of the sudden deaths of such stupid people as she describes are surely more easily borne than the three closely-printed volumes with which she overwhelms both readers and reviewers alike.

#### FLOWER'S HISTORY OF THE TIN TRADE.\*

IN his recent sketch of the history of the tin trade, a subject which has never hitherto been treated in anything like a full or satisfactory manner, Mr. P. W. Flower has brought together a mass of valuable information throwing light upon the origin, the progress, and the present position of this highly important interest. Ranking after gold and silver first in value among the common metals, at the same time the lightest and most fusible of all, it is only as an alloy or as a coating for other metals that tin comes practically into consideration, being hardly at all used by itself. Ductile as it is, as well as melting at a gentle heat, it cannot be drawn into wire. In its origin, however, it carries us back to mythic or prehistoric times, being found blended with copper in the bronze implements of an age far beyond authentic history, and diffused well nigh as widely as the human race itself. The earliest and most authentic tradition traces the discovery or the introduction of the metal to the Phœnicians, and points to the British Islands as the source to which those adventurous and hardy mariners had recourse for their supplies of tin. Mr. Evans's recent able and exhaustive history of bronze implements has made altogether superfluous any notice of the slight sketch of the earlier authorities prefixed to his work by Mr. Flower, who has little or no pretension to critical scholarship or literary skill, as may be judged from his adoption of the view that the Phœnicians or Phœnicians were a Buddhist or serpent-worshipping tribe who came from a district in Afghanistan (*oph-gana*, *aph-gana*), *gana* signifying a tribe, and *oph*, *aph*, *saph* signifying a serpent, the emblem of Buddha or wisdom. For the practical purposes of his book, however, he is safe in taking up the tale at the point of the Roman trade with Britain, illustrating the mode of transport across Gaul by the aid of Sir Henry James's drawing of a horse carrying strapped to it on each side the peculiarly shaped block of tin of which a pattern was dredged up at Falmouth about the year 1811. His industry has enabled him to put together a fairly connected summary of what is to be known of the progressive trade and metallurgy of tin under the Saxon, Norman, and English kings, partly by the light of royal charters and enactments, together with Acts regulating the coinage and fixing penalties for adulteration. With the history of the stannaries there is bound up an epitome of the mining industry, and not a little of the foreign commerce of Great Britain. From the earliest times are to be seen those strange vicissitudes which in our own age are observed to mark the fortunes of the metal miner. The tin mines of Cornwall, which had been almost entirely neglected under the Saxon dominion, were so vigorously developed

\* *A History of the Trade in Tin: a Short Description of Tin Mining and Metallurgy, &c.* By Philip William Flower. With Illustrations. London: George Bell & Sons. 1880.

after the Norman Conquest that the Archbishop of Canterbury, under whose hands they had been placed by King Richard I., when the country was almost ruined by the Crusades, was able to remit to his sovereign, then abroad, a sum of money exceeding 1,000,000*l.* sterling. In the reign of John the produce, on the other hand, was so inconsiderable that the rent of the tin farms amounted to no more than 100 marks, a fact due, it may be suggested, to the mines being under the hands of the Jews, who found in such bargains a heavy make-weight for their advances to the impetuous monarch. In the next reign immense profits were realized by Richard, Duke of Cornwall, brother to Henry III., the produce of the mines being subject to a royalty of 40*s.* for every 1,000*l.* in value, all the tin having to be brought twice a year to the appointed places, of which Truro was one, to be officially stamped and weighed.

Up to 1240 a monopoly of the European supply of tin was held by Cornwall; but in that year a lode was discovered in the mountains of Bohemia by a Cornish tinman banished from England, either on account of his religion or on a charge of murder. Further discoveries followed at Attenburg, in Saxony, in 1458, and in Barbary in 1640. In Spain the constant invasions of the Moors caused the mines to be neglected. Against foreign competition an Act of Parliament was passed in the reign of Henry VIII., enacting that no person should buy tin or any wares made of tin out of the realm. The enlightened policy of Queen Elizabeth led to the introduction of German miners, by whom many of the Cornish processes were much improved. For nearly two centuries not much has been ascertained beyond the circumstance of a glut in the reign of Queen Anne, who had in stock at one time 5,000 tons of tin, equal to five years' consumption. About the middle of the last century began the competition with Eastern or foreign produce, small quantities of Banca tin finding their way into Holland, and from thence into England; but the Cornish yield happening to increase at the same time by 500 tons, a panic ensued, the importation of Banca falling off from 543 tons in 1787 to 80 tons in 1788, and 40 tons in 1789. The East India Company taking up largely about this time the export to India and China of some 800 tons annually, which they obtained at a lower price than that paid to the tanners of Cornwall, the market was relieved of the Banca trade, and an artificial system was created whereby prices were enhanced, until this interesting traffic was brought to a close in 1817 by the re-shipment of Cornish tin from China to London, underselling the artificially-priced Cornish produce. Our author's figures enable us to follow in ample detail the history of the trade from that time to the present, tracing the increase both in home consumption and exportation, as well as that in the supplies from the East and elsewhere. The Cornish supply, which was 2,500 tons in the year 1800, exceeded 10,000 tons in 1873, and this quantity was more than doubled by importation. The price has ranged from 60*l.* to 150*l.* a ton, the return of produce to the Mining Record Office, to the Stannary Court, and the Duchy of Cornwall amounting in value to 1,084,081*l.* The statement of Banca tin (imported in slabs weighing 1,000 to 32 tons English) sold at auction by the Dutch Trading Company between the years 1857 and 1874, exhibit an average of about 5,000 tons annually, at about 120*l.* a ton. The total imports of tin into Great Britain for 1874 amounted to 9,218 tons, the largest contribution, 4,177 tons, coming from the Straits Settlements; and the next, 2,293 tons, from New South Wales. The tin exported from this country for that year was 155,068 cwt*s.*, of the value of 813,305*l.*

Why Mr. Flower's work, compiled, for the most part, as he incidentally lets us know, so long ago as the year 1875, should have been kept so long from seeing the light we fail to understand. Nor do we see why in the interval he should have limited himself in his cursory notice of the metallurgy of tin to elementary or antiquated sources, such as Dodd's *British Manufactures* and the *Gallery of Art and Nature*, when he had at command the far more advanced and authentic notices of Dr. Percy and of Mr. Hunt in his new edition of Ure's Dictionary. It is, however, not from the scientific so much as the historical point of view that he approaches his subject, dealing more especially with the rise and development of the tin-plate trade, from its first introduction in 1625 from Saxony by Andrew Yarranton, whose early attempts, defeated for a while by counter-patents and the defection of his partners and patrons, were carried to great success a century later by Major John Hanbury of Pontypool, afterwards member for the county of Monmouth, and ancestor of the present family of Hanbury Williams. Hanbury's improvements in the machinery employed, and his invention of the method of rolling iron plates by means of cylinders entitle him to the credit of having practically established in England the art of tin-plating. His portrait, engraved from a family picture at Pontypool, is appropriately prefixed to Mr. Flower's work. To Yarranton, notwithstanding, our author deems it due to assign the title of Father of English tin-plates, as well as that of the founder of English political economy, by reason of his enlightened appreciation of the signs of the times. Fired, when in Saxony, by the news of our ships having been burnt at Oatham by the Dutch, he was led to propound improvements whereby the English should beat the Dutch without fighting. He was the first man in England, writes Dove, in his *Elements of Political Science*, who saw and said that peace was better than war, that trade was better than plunder, that honest industry was better than martial greatness, and that the best occupation of a Government was to secure prosperity at

home and to let other nations alone. Such, Yarranton proclaimed, would be the result of the following improvements:—

1. The Improvement of our Linen and Iron Manufactures.
2. The Settlement of our Navigation Laws.
3. The Establishment of a Public Register for all Lands and Houses.
4. The Cutting Canals and improving the Navigation of our Rivers.
5. A public Bank with a proper issue.
6. A Court of Merchants to decide between Merchant and Merchant.
7. A Lumber House where money should be lent on goods at easy interest.

These ideas were embodied in *England's Improvements by Sea and Land*, by Andrew Yarranton, Gent., 1677, a book so rare as to be lacking in the libraries of the British Museum and the Bodleian. Mr. Flower has done the public a good service by reprinting from the second part the chapters on "the manufacture of iron and tinn." To this curious extract, which treats more directly of the writer's personal wrongs in the matter of his patents than of the processes which he claims to have introduced or improved, are added some further reprints of occasional papers which it was quite worth while to rescue from oblivion, giving, as they do, the fullest and most authentic details to be had of the progress of this important branch of industry. A quaint specimen of the early literature of the subject is a "Dialogue betwixt a Tynn Minor of Cornwall, an Iron Mynor of the Forest of Dean in Gloucestershire, and a Traveller, A.D. 1677," in which the traveller dwells upon the immense benefits accruing to Germany from the tin-plate manufacture, sixteen pounds a ton being the price of iron, and tin five pounds the hundredweight, albeit the English tin and iron were much better than the German. From the introduction of these superior methods he foresees a sure and speedy recovery of trade in Great Britain, with ample employment for the vast class of useless scholars and supernumerary clergy, of whom he is credibly informed there are thirty thousand with no more than ten thousand livings to share among them. Of a more scientific character is the dissertation of the famous Réaumur upon the elements of the art of making plates, translated from the *History of the Academy of Sciences*, Paris, 1725, in which the writer speaks of the works established by Colbert at Chenevay (Franche Comté), and Beaumont la Ferrière (Nivernois), which had failed from want of protection. They had been limited, it appears, to turning out as white iron or tinned sheets the black plates imported from Germany. The main secret derived from the German workmen is described as the use of fermented rye to produce the sour or acid waters for pickling the plates and fixing the deposit of tin. Other solutions, as alum, salt, and sal-ammoniac, were tried by the great French chemist, but found too weak. Vinegar, which must naturally have been tried before rye-water, was thought too dear, though working more quickly. The grease used for preventing the surface from being burnt gave occasion to many experiments. This was another secret of the German tanners. Réaumur, after mixing sal-ammoniac, soot, and lamp-black with common grease, was given to understand that burnt tallow was the right thing, the cause of which superiority it would, he thinks, be very interesting to know. To this succeeds a description of the manufacture as carried on at Mansvaux, in Alsace, established in 1714 (from Diderot's *Encyclopædia*, 1756), with two illustrations of the works and processes employed for making the bar-iron, hammering it into plates, and dipping them six hours in the cauldron; the "secret," supposed to be copper, being here introduced to assist in the coating. The third extract gives an account of the German and Swedish manufactures, as carried on at Hülff Gottes Irgead, near Platten, in Saxony; Heinrichsgrün and Graslitz, in Bohemia; and Joanneßors, near Forsmark, in Sweden. This was published in Lyons in 1774, from travels made between 1757 and 1769 by M. Jars. Rolling had been attempted in the Swedish works, but had given way to the old process of the hammer. This crowning improvement had still to await complete success, the earliest experiments in England being described in the instructive letter of Mr. Samuel Parkes to B. Naylor, Esq., Feb. 20, 1818, which is the next in order of our author's transcripts. Rolling, both hot and cold, had here been tried, but with imperfect results, not one plate in three turning out thoroughly good. After being steeped in lees of bran and water the plates were pickled in sulphuric acid and water, in proportions judged of by the workman, high wages being earned by a good pickler. Finally came the tinning, burnt grease or any kind of empyreumatic fat being used in preference to tallow. By the aid of diagrams five successive processes are shown through which the sheets had to pass, ending with the listing-pot for the object of knocking off the thin strip of metal formed on the lower edge of the plate as it cooled in a vertical position in the melting-pot. A table of the common names in use for various sizes and qualities of tin-plates, with their trademarks and current prices in the London market, completes this survey. A paper by Mr. Ebenezer Rogers, taken from the Reports of the South Wales Institute of Engineers, 1857, carries on the history of the industry, with the introduction of grooved rolls by Henry Cort in 1783—its establishment at Cyfarthfa under Mr. Richard Crawshaw in 1790 forming a special point of progress. A series of scattered notices fills up the gap between that period and the existing stage of the manufacture, our author closing his work with a popular account of the processes in most general use, with a forecast of what seem to him its prospects from a commercial point of view. He is not, we trust, over-sanguine in anticipating for England the perpetuation of the world-wide monopoly which she at present has to boast; but with the inexhaustible supply which she possesses of a metal so

limited as to its sources, it can only be by a shameful relaxation of her industrial energies that she can suffer herself to be superseded by any foreign rival. Our author's statistics go far to prove that in the tin-plate trade we have virtually an index to the spread of national prosperity, if not of civilization itself. Who can assign bounds to the demand for tinned or canned oysters from Baltimore, lobsters from Maine, salmon from Alaska, peaches from Florida and Maryland? One petroleum firm in the City of New York is said to cut up 600 boxes (30 tons) of tin-plate daily. No less than 1,600,000 boxes are already absorbed yearly by the United States, more than threefold the consumption of the continent of Europe, of which quantity a full tenth goes to pack sardines at Nantes. Australian meat craves an ever-increasing supply, while British biscuits, mustard, and gunpowder range in bright canisters all over the world. The home consumption is variously estimated at between 500,000 and 750,000 boxes per annum; but the returns to Government have not been ample and unreserved enough for any accurate figures to be laid down. Our author deserves the thanks of the public for the pains he has taken in the compilation of so instructive a mass of figures and facts.

#### TRÜBNER'S ORIENTAL SERIES.\*

ORIENTAL learning has at least kept pace with the general advance of science during the present century; specialists will even say that it is one of the most signal examples that can be adduced of the progress of knowledge. It is indeed difficult to keep pace with the constant flow of new discoveries from Assyria and Egypt, China and India, and the fresh lights thrown on the religious literature, and languages of every region of the East. A great part of the difficulty lies in the scattered condition of the newest information. It is impossible for any but a determined specialist to ransack antiquarian and linguistic journals in remote parts of the world for the latest conclusions arrived at on the place of the Samoedion idioms in comparative philology or to search for little brochures on the origin of Chinese civilization or the migration of Aryans to Corea. An Oriental encyclopædia is sorely needed, and we must be grateful to Messrs. Trübner for having in some measure supplied the deficiency. It is true the method of collecting all available information on the leading subjects of Eastern study in a series of independent volumes is not so convenient or so comprehensive as an alphabetically arranged dictionary; but something is better than nothing, and Messrs. Trübner's Oriental Series, besides possessing a profundity and exhaustiveness which could not be attained in a mere article, will provide the materials from which an encyclopædia of the East might be easily compiled.

The two volumes recently added to the series are of very different merit. Mr. Davies's volume on Hindu philosophy is an undoubted gain to all students of the development of thought. The system of Kapila, which is here given in a translation from the *Sāṅkhya Kārikā*, is the only contribution of India to pure philosophy. The exposition is the oldest in existence, and the most authoritative; but it is doubtful how closely it represents the original teaching of Kapila, who lived before the time of Gautama the Buddha, in the sixth century before Christ. The *Sāṅkhya Kārikā* has been several times edited and translated, but hitherto with indifferent success, according to Mr. Davies; and, from the examples he gives of Sir H. Colebrooke's version, and even Lassen's, we must agree with him that the meaning of much of Kapila's system has been misunderstood, even by the most eminent authorities, though the frequent obscurity of the original is a sufficient excuse for considerable misapprehension. Mr. Davies has evidently devoted himself to the elucidation of the seventy-two dicta which make up the work with as much zeal as success; and the comments which are interspersed among the sibylline dicta of the philosopher testify to no ordinary industry and acumen. If in the general analysis (pp. 101-118), and the appendices on the resemblance between Kapila's system and those of Spinoza, Schopenhauer, and Von Hartmann, the author is a little venturesome, and inclined to lay stress on secondary characteristics, it cannot be disputed that the comparison is amply justified by the many points of similarity which are disclosed between the oldest Hindu and the newest European philosophy.

Kapila is purely a philosopher, and the rites of Vedantic religion are an object of scorn to him. He allows gods, indeed, but only as emanations from nature eventually to be re-absorbed like all other forms of matter. The object of philosophy with him is to escape from pain and sorrow, which he regards as inherent in the world of matter. "Our present physical life is a mere bondage; it is full of pain, it can never be the source of anything but sorrow and degradation. The aim of philosophy is simply to free the soul from this and every other connexion with matter for ever. We must seek to cast it away, as men cast off a vile and loathsome garment; and this emancipation must be gained by the soul itself, without the aid—if such aid can be obtained—of any external power or influence." Knowledge, and that of the right kind, alone can liberate the soul from the trammels of the

material world. There is no place for God, or a guiding intelligence, in Kapila's system:—

The one primeval source was simply Matter, and in all its developments was wholly unconnected with the working of Mind. It wrought, and for a distinct purpose, but unconsciously, and by a potentiality which dwelt entirely within itself. How, then, did Nature (*Prakṛiti*) begin to work? Because, says Kapila, though formless, it has modes or constituents of its being. When these are in a state of equipoise Nature is at rest. When the equipoise is disturbed then Nature begins to work. The impelling influence was an unconscious purpose to free the souls of men from all contact with matter, which is the source of pain. For this purpose it first sent forth intellect (*buddhi*), the first-born of all created things. But the nature and functions of this first product are not clearly defined. It has a faculty of ascertainment; and by this Kapila means a determinant power by which the perceptions of sense-objects are defined in an ultimate form, that the soul may look upon them and gain a knowledge of their nature. From intellect, consciousness, or egoism, is evolved. It is from this product of thought that a knowledge of the difference between subject and object is gained. But consciousness, in emanating from intellect, becomes a separate entity, and the intellect works without any consciousness of its working or of its effects. From egoism or consciousness—i.e. conscious mind-matter—spring the *manas* (mind), the ten organs of sense and action, and the five subtle elements. The *manas* is an internal faculty, the doorkeeper of the senses, which are the doors through which the soul gains a knowledge of nature. It receives the sensations which the senses give from outward things, and has a formative power. Our sensations hereby become perceptions, and these, passed on to consciousness, become individualized as "mine"; then by the intellect these individualized perceptions become, in the language of Sir W. Hamilton, "concepts or judgments," and are fit to be presented to the soul.—1<sup>st</sup> p. 106-7.

Mr. Davies does not pretend that this is a complete representation of the ideology of Kapila, but it is as near an approximation as the differences of the terms allow. The system generally is a form of materialism, in which, however, the soul exists apart from consciousness and the outer world; but it is uncreative, and exists only as light does. It dwells apart, like an Eastern monarch, above and superior to nature: it alone sees and can understand nature; and by this learn to know itself, and thus to win that liberation from material bondage which alone can put an end to pain and suffering. "The soul then gains its supreme state of unmoving, unconscious self-existence which it never afterwards loses." In this system all things are made to minister to the soul, and in the words of Hegel, "Everything in heaven and earth aims only at this—that the soul may know itself, may make itself its object, and close together with itself."

It would be worth investigation to discover how far this system influenced the Neo-Platonic school, and the numerous sects of pantheistic mystics who, especially in Persia, combined in so remarkable a manner an originally material philosophy with a theistic nucleus and a strenuous ethical code. In this last they borrowed nothing from Kapila. In his system there is no place for virtue or vice, duty or sin. The soul has no purpose outside itself; it is passive, unsympathetic. Virtue and vice are little distinguished except as matters of sensation; and, as pleasure and pain, they are to be avoided, because they imply action, and action is imperfection. Virtue and vice do not belong to the soul or in any wise affect it. The sense of guilt, implying a moral law, which in turn implies a higher power to ordain it, does not exist in Kapila's system. Even acquiring knowledge and thus delivering the soul from bondage is not a duty nor the neglect of it a sin; it is a matter of individual advantage. Such a system is clearly esoteric, and it is natural to find Patanjali (about 200 B.C.) popularizing it by inserting a supreme Spirit, enjoining intent contemplation of that Spirit as a means to attaining re-absorption therein, and supplying the moral directions which Kapila omitted. These amendments are foreign to the original system, and Patanjali's reformed philosophy has done more harm than good, and encouraged sensuality, hypocrisy, and imposture. The older system of Kapila, however, though it could never have been very widely accepted or understood, presents many points of deep interest to the student of comparative philosophy, and without Mr. Davies's lucid interpretation it would be difficult to appreciate these points in any adequate manner.

Mr. Long's *Eastern Proverbs and Emblems* is a very different kind of book, and ought rather to have been published by some Religious Tract Society than in a series of scholarly treatises and translations. The work was begun twenty-five years ago "in the jungles of India for the instruction of peasants and women" but Mr. Long considers it adapted also for the instruction of "Orientals, Lovers of Folk-lore, Teachers, and Preachers." The last denomination affords a clue to the real design of the book, and the statement that the proverbs in the volume are "limited to those serving to illustrate moral and religious subjects," turns conjecture into certainty. It was, perhaps, unnecessary for Mr. Long to tell us that his proverbs are "not the productions of the book-worm or the midnight oil" (which would have been highly dangerous in the jungle), and to enjoy his little laugh at book-learning, for the constitution of his own book furnishes irrefragable evidence on these points. The truth is that *Eastern Proverbs* consists of a bushel of scriptural texts, arranged in any order, each followed by a little sermon on the subject of the text, to which are appended such proverbs of all nations as Mr. Long deems relevant to the said text and sermon. Let us examine these three divisions *seriatim*. The texts need little notice. They are apparently intended to convey rather the general sense than the precise words of the verses to which references are given; for example, the text "Book-cram" is not even the revised New Testament version of 2 Timothy iii. 7. The short sermons which follow each text seem sometimes, from their subdivisions into convenient "first, secondly, thirdly, and lastly," to be materials

\* Trübner's Oriental Series.—Hindu Philosophy: the *Sāṅkhya Kārikā* of Īśvara Kṛishna: an Exposition of the System of Kapila. By John Davies, M.A., M.R.A.S.

*Eastern Proverbs and Emblems, illustrating Old Truths.* By the Rev. J. Long, M.R.A.S. London: Trübner & Co. 1881.

for rural edification, and are not always to the point. They are very innocent and garrulous, and very dull reading. Sometimes they are enriched with instructive little bits of information, and it was doubtless this part of Mr. Long's work that delighted the peasants and women in the jungle. For example, on the text "The Body a Clay House crushed before the Moth, Job 4, 19," we have remarks on Arabian houses, and the following paragraph on the moth:—

The moth is a small insect which noiselessly and gradually eats through garments, though very feeble, Job 27, 18. The rich are no more spared than the poor, but it especially attacks things not kept clean, and does its work secretly, spoils by degrees; so God gives cleanness of teeth, the palmer worm, the pestilence, Amos, 4, 8; the moth eats the inside when the outside is good, so Sampson [sic!] said when his locks were gone, I will rise up, Judg. 19, 20; so the Jews, 2 Kings, 15.

These frequent references are very troublesome, even though the reviewer always has his Bible on the table before him; yet without constant rustling of leaves it is impossible to discover whether Samson determined to rise up because the moths were eating him inside or for some other cause; and whether the Jews rose up, or lost their locks, or were eaten by moths in 2 Kings, 15; nor is the confusion mended by the accident that Judges 19 has nothing to do with Samson, but relates to a much less agreeable history. Under the heading "The angry fool as a bear robbed of her whelps, Prov. 17, 12," we are treated to a vivid account of the characteristics of female bears under provocation, and the sporting rules of the Russians of Kamtschatka with regard to cubs, and are then enlivened with eight references to the Old and New Testaments, the well-known history of Elisha's she-bear and the forty-two children, allusions to David, Saul, Herod, Jacob's sons, Saul again, and Nebuchadnezzar; after which the following proverbs are given to point the moral:—

*Telegu.* Pouring ghi on fire.

*Gujerat.* Anger and water descend.

*Tamul.* The irascible are like a man on horseback without a bridle.

*Bengal.* A fire in the thatch is quickly kindled; so anger.

*Buduga.* If a jackal howls, will my old buffalo die? If an angry man curses me, what shall I lose?

*Tamul.* Like the man who would not wash his feet in the tank because he was angry with it.

*Modern Greek.* The rancour of a camel is unforgiving.

*Turk.* The torrent (anger) passes, the sand remains.

These proverbs, which form the third division of our subject, as Mr. Long would say, are the best part of the book. It is true no references to authorities are given, and we have no means of ascertaining the accuracy of any given proverb; but if Mr. Long got many of them from his peasants in the jungle, he could not have gone to a better source. The difficulty about the proverbs is that their meaning is not seldom obscure or equivocal, and Mr. Long puts them under headings to which they really bear no relation. They cannot, indeed, be said to be scientifically arranged—nor is the book at all open to the charge of being a scientific work—but there is a certain interest in proverbs quite apart from their context which will induce some readers to pursue the devious route on which Mr. Long guides his disciples. Only let no man take the book, on the strength of the series to which it belongs, for a serious contribution to the history of proverbs; all that can be said for it is that it contains a large number of proverbs, collected from remote regions and rare sources, together with a larger quantity of irrelevant and unprofitable "discourse."

#### RAMBLES AMONG THE HILLS.\*

*RAMBLES among the Hills* take a somewhat wider range than the *Field Paths and Green Lanes* of Mr. Jennings's earlier volume. They lie chiefly between the Peak of Derbyshire and those Sussex South Downs which, though they scarcely suggest the idea of hills to a highlander, were dignified by Gilbert White with the title of majestic mountains. For Mr. Jennings continues his explorations in Sussex—partly, perhaps, because his residence appears to be in that county—and we are very glad of it. We agree with him that, although Londoners will insist on going farther, they may fare much worse, for there is no more attractive scenery of the kind than that which is to be found within sixty miles to the southward of their city. Mr. Jennings has the born vagrant's liking for solitude, and in Sussex he may indulge it to his heart's content. As we know by experience, it is possible to walk through a summer afternoon, within easy reach of such gay watering-places as Eastbourne or even Brighton, and never come across a stray wayfarer who gives you the notion of his being familiar with society or cities. The shepherds leaning upon their staves among their flocks have become misanthropic, so far as un démonstrative demeanour goes, in the course of their lives of self-communing in the wilderness. Their very dogs, when they are not actually upon duty, are rapt in slumber or abstracted contemplation of the clouds; and there is a dead-alive air of picturesque stagnation over the sequestered villages and hamlets with their primitive systems of agriculture. From generation to generation, as Mr. Jennings assures us, and certainly we have no reason to question the fact, the Sussex people have clung to their parishes. Even the Sussex domestic servants, strange to say, have the reputation of sticking to their places. So the old families are slow to be up-

rooted; there are landowners who have been settled from the times of the Edwards, and even earlier, on the acres that have come down to them in direct descent; and when they have parted with their lands they have subsided into humble stations, in place of seeking to retrieve their fortunes elsewhere. A *propos* of an aristocratic-featured shepherd, with whom our author held converse in one of his walks over the downs near Lewes, he remarks that the representative of more than one ancient line may now be found looking after sheep in the neighbourhood of the family hall. "The Tuppins and the Serases, once the owners of broad domains, are gone from the records of the gentry, but are still to be found in the cottages of the peasantry." He numbers among his peasant acquaintance a gentleman-shepherd descended from the former family, who is to be seen toiling after the sheep in all weathers, but whose appearance and bearing would attract attention in any drawing-room where one happened to meet him. But we suspect that Mr. Jennings was the more struck with the man because his case is very exceptional. At least, if well-born shepherds are common on the Sussex Downs, we should say that their manners must have deteriorated, if their physique has not degenerated.

It is what we may call the by-play of Mr. Jennings's books that gives them their greatest charm. A little reading of an ordinary guide-book goes a long way, and the most picturesque descriptions of scenery are apt very soon to pall on one. Mr. Jennings notes all that is best worth seeing, in the way of churches, halls, or natural beauties; he gives sufficiently minute directions for finding one's way across country by field paths, and frequently offers you the choice of alternative routes, summing up judiciously on their respective advantages. But he enlivens his pages by recording his gossip with all manner of acquaintances whom he has made promiscuously; and he introduces delicate touches in his pictures of cottage interiors which, though seemingly slight, are often telling. Sometimes the comic element predominates in these reminiscences of his, though comedy, we should say, is scarcely his strong point. Occasionally the circumstances and surroundings of these accidental interviews are impressive and even melodramatic. Here, for instance, is a random adventure at Hardwicke Hall, which brightens a chapter, though there is little in it. The Duke of Devonshire does a good deal of preserving there, and the coverts seem to have swarmed with hares and pheasants. Consequently the head keeper has by no means a sinecure, though his place may be a profitable one; and he might have said, with Sir Hugh the Heron in *Marmion*, "St. George! a stirring life we lead, who have such neighbours near." Mr. Jennings, in strolling about the ruins, had nearly stumbled into the jaws of a tremendous mastiff. The keeper came to the rescue, and they naturally got into talk. "What a horrible dog!" remarked Mr. Jennings excitedly, by way of opening the conversation. "I don't know what we should do without him!" observed the keeper in reply. And then he went on to comment on the incessant warfare waged with the poachers. He and his men could seldom go out without meeting with a gang. And as the poachers, who came from the neighbouring collieries, are capitalists who have invested in a costly "plant," they seldom care to abandon the field without a battle. On the last hostile encounter, among the prizes of war that graced the keepers' triumph, were no less than five hundred yards of new netting. Mr. Jennings, by the way, who is a man with ideas of his own, was anything but favourably impressed by the exterior of the famous Hall. He quite agrees with Horace Walpole, who wrote of it just one hundred and twenty years ago, "Never was I less charmed in my life." It might be mistaken, Mr. Jennings says, for the work of some modern architect, built for the Nabob of a couple of generations back, who had enriched himself when the pagoda tree was worth the shaking. When one enters the Hall, to be sure, these first impressions are modified. Within may be read everywhere certificates to its venerable age in the panelings, oak staircases, and tapestried hangings.

But Bolsover Castle, which stands within sight, is still more "eerie" within doors than any ordinary old hall can be made, even by black oak panelling and secret chambers. And at Bolsover Mr. Jennings made the acquaintance of an inmate with whom the stalwart keeper of Hardwicke might have been loth to change places, though she had to contend with no enemies in flesh and blood. Bolsover Mr. Jennings describes as "the most weird and ghostly of all the houses I have seen—a place of mystery, where the spirit of the past still holds unbroken sway, and where the influences of modern life appear to be powerless." Once it had been in the same hands as Hardwicke; at least it belonged to the Earl of Shrewsbury, the hen-pecked husband of the famous "Bess of Hardwicke." Now it is in the possession of the Dukes of Portland, Bess's descendants in the female line. Mr. Jennings gives a succession of Salvator Rosa-like studies of the gloomy effects of the sombre edifice. There are crumbling gateways and mouldering coats of arms, with long rows of windows of deserted chambers, looking down on terraces overgrown with weeds. "There were fine flights of steps, leading down only to wildernesses of grass and weeds; and here and there on the dismantled walls were broken mantelpieces and cornices, preserving even in decay some remnant of their former beauty." The only inhabitant when he visited the place was an ancient woman, to use language in keeping with the character of the place. She seems to have been but too happy to find somebody to talk to, and did the honours of "the livery and splendour" of the Castle with voluble affability. She conducted the stranger through venerable suites of vaulted rooms, with furniture and mouldering portraits to match. One of the smaller of the quaint

\* *Rambles among the Hills, in the Peak of Derbyshire and the South Downs.* By Louis J. Jennings, Author of "Field Paths and Green Lanes." London: John Murray. 1880.

bedchambers bore the agreeable name of "Hell"; and, although tolerably furnished and hung with pictures, there the haunting sense of some ghostly mystery was heightened. Nor was Mr. Jennings's sympathetic depression altogether inexplicable. "Very strange noises are heard here at night," observed the old lady; "but we do not mind them. They are heard all over the house." And indeed, as it afterwards appeared, she firmly believed that there was a retiring room for ghosts in a walled-up crypt under the echoing floor of the vaulted kitchen. She had repeatedly seen a lady and gentleman—the lady wearing a scarf, the gentleman in ruffles—standing on the threshold of the kitchen door. Her husband and she had tried to trace the sounds to their causes, without success; but latterly they had become used to them and to the apparitions. In fact, if Bolsover is not actually the abode of restless spirits, it ought to be; and Mr. Jennings has written a most sensational chapter, in a style that does credit to his artistic powers. So much so, that on concluding it, in an agreeable horror, we registered a vow to make a pilgrimage to Bolsover in the ensuing summer, although we should not be altogether surprised were we to find on arriving there that leave for the admission of visitors had been withdrawn. We have often fancied that gossiping travellers like Mr. Jennings take a somewhat unfair advantage of the family retainers whose unguarded disclosures they elicit with the intention of chronicling them in detail. It is possible that there may be great people who have a natural objection to having the blaze of publicity flashed by a stranger on affairs which are no concern of the public's.

In striking contrast to their Castle of Bolsover is the chief seat of the Portland family at Welbeck. It is, by something of a political license, by the way, that Mr. Jennings includes Sherwood Forest and the "Dukeries" in *Rambles among the Hills*. Welbeck, as it has been left by the last Duke, might well be dubbed the Portland Folly; and his eccentric Grace had provided the most luxurious accommodation for whole legions of ghosts in distant generations. "Had he been a poorer man he would have ruined himself in bricks and mortar; but, as he enjoyed an income of an almost fabulous amount, he could gratify his vagaries without danger of impoverishing either himself or his heir." There are miles and miles of elaborately built tunnels, there is a vast subterraneous ball-room, a subterraneous chapel with lifts, skating-rinks, and underground conservatories. There is a riding-school lit by seven thousand gas jets, tiled with copper, corniced in sculptured stone, and surrounded by a frieze of fine brass work curiously wrought, with numberless varieties of birds. Near it is a "gallop" under glass; and all these works were completed as carefully as "if they had been intended for the front of the abbey." It has been estimated, "on very good authority," that the cost was something like two millions. By the by, in talking of the Portland family, Mr. Jennings mentions a report which is new to us, but which he asserts is generally believed in the neighbourhood. The people say that Lord (George Bentinck's sudden death is to be attributed to a dose of poison administered to him by the notorious Palmer. "It was known that Palmer had recently lost large sums to him, and it is said that the two men were together the very day before the catastrophe." The book is full of anecdotes and incidents, with suggestive ideas for summer walking tours, and, though somewhat too bulky for the pocket, would be well worth carrying in a knapsack.

#### PUBLICATIONS OF THE ENGLISH DIALECT SOCIETY.\*

THESE three volumes, in spite of their usefulness and value, may probably leave those who consult them at some loss to know why a series of glossaries need travel to a large extent over the same ground, and, indeed, what the conditions may be which entitle a word to be admitted into these glossaries. The Irish people, whether of the Celtic stock or English immigrants, may be fond of comparisons and clever in applying them; but it is not easy to see why the phrase "cold as charity," for example, should find a place in a list of words used in the counties of Antrim and Down. It may be heard there more frequently than in England, but there is nothing peculiar in the usage; and to those who may argue that if glossaries of dialects are to serve any practical purpose a good many entries of the same words must be found in more than one glossary, the answer may be made that much space would nevertheless be saved by the reader referring from one volume to another. As it is, we have two, sometimes three, explanations of the same word, and each of these sometimes supplies information not to be found under the other entries, while the reader is also sometimes referred to quite other sources for information which is furnished in full in some other of these glossaries. A diligent collation of these lists would have saved the reader no small amount of trouble, while it would have added greatly to the usefulness of the lists themselves.

Some objection may also be made to the seemingly capricious way in which words are explained or left unexplained. In some instances a good deal is said about words which can scarcely

fail to tell their own story; and nothing is said of others which look perplexing, and which may have had an interesting career. The glossary entries, again, may be of words which, with some justice, may be regarded as local, or of words which may be found in more or less varied forms in other parts of the country, or which may translate other words, or which may have been bodily borrowed even from a foreign tongue. In each case the fact might have been noted, to the great benefit of all except the scanty number of students who may need no such aid. The editor tells us that the words and phrases in the Antrim and Down Glossary are mainly of Scottish origin, and may be found in Jamieson's Scottish Dictionary, as well as in some of the volumes issued by the English Dialect Society. But in what sense can such expressions as "art or part," or "clinch," in the sense of a conclusive argument, or "lit," as denoting the moving from one abode to another, be regarded as anything but a part of the common inheritance of all who speak English? Under the entry *thunder* we have simply the citation "He turned up his eyes like a duck in thunder"; but the phrase may surely be heard in every county in England; and so also the phrase "carry on," in the sense of peculiar or wild behaviour, is a familiar sound probably in the ears of Englishmen everywhere. Some of the words, we need not say, are well worth noting. Among these we have the form "enjoin," "injoin," as meaning an ingenious thing or contrivance; and "snig," "a juvenile thief, who steals the kites of other boys by cutting the string and seizing the kite when it falls." This may perhaps be a variant of "sneak," with a local limitation of meaning. In the word "pelt," as in "He ran out in the street in his bare pelt," we have a form which is explained by "poltry"; but it might be interesting to have some account of "barge," which is said to denote some kind of bird and also a scolding woman. "Bunce," the commission given to persons who bring buyer and seller together in a flax-market, is explained as perhaps a corruption of *bonus*, the phrase "bunce the money" in the sense of dividing it being also known. ("Gyly," we are told, means "very well" or "in good health," and answers the question "How are you?" It is probably, therefore, only another form of "guily"; but "gunked," meaning "taken aback," "disappointed," remains a mystery. "Girn" we have in two senses, the one of a noose, the other of a cry; but these are really two words, and it might be worth while so to inform the reader, who might not see the connexion of the second with the large family of words denoting low or moaning sounds.

The glossary of Cornish words brings us to a subject of decidedly greater interest. The remarks which we have already made apply to the list both of West Cornwall and East Cornwall words, though in a less degree, as we might expect, to the former than to the latter. It is well that these lists have been made; for, with railways and the inroads of travellers, the dialect, Miss Courtney tells us, is "fast dying out, giving place to a vile cockney pronunciation, with a redundancy of *h's*." The younger generation are ashamed of and laugh at the old expressive words their parents use." But even now the men of different districts of the further West may be distinguished, not only by their words, but by the local intonations, which impart a singsong drawing character to their speech. The most marked difference, we are told, is found "between the dwellers on the mainland (Penzance, &c.) and the inhabitants of Scilly, or, as they would call themselves, Scillonians. With them *threed* becomes 'tread,' and *threes* 'tree.'" The sentence scarcely makes it clear to which of the two this usage belongs; but the fact may suggest a comparison with the form "Treiskephalai," which Herodotus mentions as the name given to a spot known also as Dryoskephalai, near Plataia; or, again, with the words *Tirimakia* and *Trinakria*. Of the words in the West Cornish list some are remnants of the old language; others are English words more or less changed, and some are French words or phrases disguised. The Dash-an-darras is the stirrup-cup speeding the parting guest, with which the readers of *Waverley* are familiar under the northerly form of Doch-an-dorroch. "Bucca," which is said to mean "a stupid person," and reappears in Bucca-boo, "a ghost, a bugbear," is, as the editor no doubt intended to signify, a variation of Puck as well as of Bug and Bogey; and Allee-couchee, of which nothing more is said than that it means "to go to bed," is merely an importation of the French "aller coucher." "Dring," we are told, is a crowd of people; why should we not be told that it is simply a throng? Under the heading "Seonse" we are merely referred to Coanase; but no entry Coanase is to be found, and for this word we are left wholly in the dark. At first sight the entry "*Dryth*, used by washerwomen when clothes don't dry," looks puzzling; but the editor luckily adds the phrase "There's no dryth in the air." It was possibly the usage of this part of his diocese that led Bishop Phillips to coin the words "greenth" and "blueth" with which he was fond of expressing the characteristics of genuine Devonshire landscapes. Some few words are used with very peculiar meanings. Of miners or others buried by a fall of earth it is said that the country fell on them and killed them; and a house built against a bank is described as leaning on the country. One of the most singular beliefs of the people, suggested by a false etymology, is that which brings a colony of Jews into Cornwall. This might have been more clearly shown by pointing out the connexion between the entries "Jow's bowels" and "Marketjew." The former is said to mean "small pieces of smelted tin found in old smelting works," the further remark being made that "tradition always connects Jews with tin in Cornwall. The idea had its origin from the

\* *A Glossary of Words in use in the Counties of Antrim and Down.* By W. H. Patterson, M.R.I.A.  
*Glossary of Words in use in Cornwall.—West Cornwall.* By Miss M. A. Courtney. *East Cornwall.* By Thomas Q. Couch.  
*Specimens of English Dialects.* (1) *Devonshire.—An Exmoor Scolding and Courtship.* Edited by E. F. Elworthy, Esq. (2) *Westmoreland.—A Bran New Work.* Edited by the Rev. Professor Skeat. London: Published for the English Dialect Society, Trübner & Co.

names Marazion, Marketjew." This, we are told, "is a corruption of the old name Mairaiw, a Thursday's market (Carew). Norden spells it Marajewe and gives it the same meaning"; but it would have been well to add that the supposed historical fact was suggested by a case termination.

The volume of specimens of English dialects is full of interest. The "Exmoor Scolding and Courtship" are two dialogues, not now far short of a century and a-half old, written to show the forms of speech which then held their ground in the north-western corner of Somersetshire. They appeared anonymously, but there seems to be little doubt that both are the work of the "Reverend William Hole, B.D., who was appointed Archdeacon of Barnstable in 1744." The author asserts that he has confined himself strictly to the vernacular, and indeed he resents with some warmth the imputation that the conversations are a mere "arbitrary collection of ill-connected clownish words," and the charge that in the "Exmoor Scolding" in particular "the substantives have frequently too many adjectives annex'd to them, nearly synonymous, and that the oburgatory wench in that part of the country have not such a *copia verborum* as is here represented." From these critics he appeals to the common experience of mankind; but in spite of his pleading the editor rejects as an absurdity the idea "that such long strings of synonymous words as are here put into the mouths of different persons could ever have been heard in real life." In truth, except in so far as it attests the author's diligence in hunting up local words, the "Exmoor Scolding" is not a very creditable performance; and his concealment of his name is in no way surprising. His title-page states that his dialogue is couched "in the propriety and decency of Exmoor language." The words are, of course, ironical; but the editor may well regard the insinuation that the young women of Exmoor generally spoke thus in the last century as "simply scandalous." The dialogue is, in fact, unsavoury from beginning to end, and nothing, he confesses, but the confidence that its form is not such as to attract the ordinary reader, and that students alone will take the trouble to wade through it, would have induced him to touch such pitch. But the book, it would seem, is not thus consulted by philological readers only, if the editor's note in p. 72 be correct, that "the dialogues may now be bought at the railway book-stalls, apparently reprinted from the edition of 1771, with the preface and vocabulary, price sixpence." In other words, the public have the garbage without the benefit of Mr. Elworthy's notes, which would inform them, as Mr. Skeat tells us, "whether the writer is at any moment using the true dialect of the peasantry, or whether he is indulging in literary English, and even inventing here and there forms such as do not accord with the living speech at all." The success of the dialogues from the first is certainly surprising. In the quarter of a century which followed the appearance of the work seven editions were issued; and the impression of 1788 is called the tenth. The edition of 1771 was republished in 1827. The "Exmoor Courtship" appeared in *Blackwood's Magazine* for February 1819, and "a new edition" was published by John Russell Smith, London, in 1839.

For the scholar the conversations are interesting chiefly as illustrating the form which the literary English might have assumed but for the circumstances which made the Midland the type of the written language. Had it not been for these accidents, the Southern form would probably have made it, in the editor's words, "polite to say now 'the vield was zowed with zeed; you can see how vast it do growz.'" The notes in the glossary will repay well the attention which may be given to them. But here, too, cross-references to other glossaries might be useful. The word *vung*, to take, occurs in the *Annals of Agriculture*, by Arthur Young, edited by Mr. Britten, who gives only a line to it. Here we have "when the vungst to" in the sense of undertaking sponsorship at the font. "Drenking," again, is the Devonshire afternoon meal of labourers during haymaking and harvest; it would have been well to note that the word exactly translates the *deaves* which Ellis states in his "Husbandry" to have been its name in Hertfordshire. "Bed-alo," "betwattled," and many others, might be cited as instances of words for which such references might have been given with advantage. In the West Cornwall Glossary "betwattled" is merely said to mean mad or foolish; in that of the "Exmoor Scolding and Courtship" it is explained as "seized with a fit of tattling" and so "turned fool." It is a pity that the reader should thus have to piece the information together.

The last specimen here given of English dialects is the "Bran New Wark" of William de Worful, published at Kendal in 1785. This is also the production of a clergyman, William Hutton, Rector of Beetham, in Westmoreland, from 1762 to 1811. It is as devout and earnest as the Exmoor Scolding is profane; but it is to a far greater degree a mere literary production. It contains, however, a large number of strictly local words and forms, with which Mr. Skeat has dealt in his glossary.

#### RUTHERFORD'S NEW PHRYNICHUS.\*

**PHRYNICHUS** is interesting as being the only one of the Atticist grammarians whose works have come down to us. Of the man himself little is known. Photius calls him "Arrha-

bis"; Suidas says that he was a Bithynian. He certainly flourished in the reigns of Marcus Aurelius and of Commodus, and composed an *ἐκλογή Ἀττικῶν ῥημάτων καὶ ὀνομάτων*, which still survives, though in a somewhat mutilated form. Another work of his, the *Apparatus rhetoricus sive Sophisticus*, existed entire in the time of Photius, who was largely indebted to it in the composition of his *Bibliotheca*. A few fragments of it still remain. The *Ecloga* was first printed at Rome in 1517. It was reprinted shortly afterwards at Venice by Aldus, and again at Paris by Vascosan. The edition of Nuñez, of whom Lobbeck in his preface speaks so contemptuously, appeared at the close of the same century. Lobbeck's, which is, of course, by far the most important of subsequent editions, was published in 1820.

Mr. Rutherford tells us, in his preface, that he was prompted to edit *Phrynichus* mainly by the desire to throw light upon the accidence of the Attic verb; and his articles on this branch of the subject give to the work the great value which it undoubtedly possesses. Indeed, if it were not for the sake of completeness, there seems no reason why Mr. Rutherford should not have confined his attention altogether to the verb, for the remainder of both text and notes is for the most part unimportant, or at best contains matter which may be found in a more convenient form in any good lexicon. This remark, however, does not apply to two articles, "The Growth of the Attic Dialect," and "The Lessons of Comedy," which are prefixed to the main body of the work. In the former of these Mr. Rutherford sets himself to prove that the tragedians cannot be taken as evidence in the matter of Attic usage. He contends that the dialect of their *senarii* was as much a literary survival as the Doric of the Chorus, and points out the close affinity of their language to that of Herodotus and of Ionic writers generally. Here, as elsewhere, no labour is spared to make the case as complete as possible. Mr. Rutherford has collected a formidable body of words and expressions which, though obsolete in the prose of the best period, were still used by the tragedians, and also survived in Ionic; but he seems to be rather overstating his case when he attributes those characteristics, such as picturesqueness of metaphor, which generally distinguish poetry from prose, to the tendency of language at the time when the tragic diction was formed, instead of to the simple fact that the Attic tragedians did not write Attic prose. It is unfortunate that Mr. Rutherford is one of those scholars who insist upon the absolute uniformity of Attic accidence, for his hypothesis compels him to reject the authority of many writers beside the tragedians whose names are most closely associated with Attic literature, and were it not for a large acceptance of the maxim of Phrynichus, "*ἡμεῖς οὐ πρὸς τὰ δημαρχημένα ἀφορώμεν, ἀλλὰ πρὸς τὰ δοκιμώτατα τῶν ἀρχαίων*," there would be few authors indeed whose works could, according to this theory, be classed as purely Attic. It seems impossible that in the short time which was occupied in the maturing of the Attic dialect the language can have become so stereotyped as to get rid entirely of alternative forms, and the assumption that this actually did happen involves so wholesale a rejection of manuscript authority, that even those who are most thoroughly convinced of the incompetence of late transcribers must hesitate to adopt it. No doubt the best safeguard against ignorant copyists is to be found in the requirements of metre, which in most cases will either prevent the introduction of corrupt readings or at least insure their detection. Hence it is natural that those who most distrust the manuscripts should most frequently have recourse to the evidence of verse. But the tragedians are closed to us by the considerations mentioned above, and practically Aristophanes alone is left. Such, at any rate, is Mr. Rutherford's opinion; and, although it may be objected to on the ground of narrowness, it has much to recommend it, and follows logically from his rejection of the tragedians, on the one hand, and his distrust of the manuscripts on the other. Rejecting, then, with the lyrical portions of Aristophanes, all passages in which the tragedians are parodied, Mr. Rutherford holds up the remainder of his writings as the type and model of Attic composition. But surely it is going too far to say that literary and colloquial Attic were the same, and that "an Athenian comic poet had no occasion to deviate from literary Attic in giving a faithful representation of his countrymen." Even comic dialogue, when presented in a poetical form, must differ in some respects from the language of everyday life; and, whether the difference be great or small, it must be taken as counterbalancing to some extent the more corrupt state of the prose manuscripts. Moreover, if we grant Mr. Rutherford's premisses, it is not necessary to adopt his conclusions in the dogmatic form in which he expresses them. Even Aristophanes affords some exceptions, which cannot be got rid of, to the rules which are based mainly on his authority; and these, occurring in the works of the greatest master of the Attic dialect, at once invalidate Mr. Rutherford's theory in its extreme acceptance. If he were content to regard the "law of parsimony" as the statement of a general tendency of Attic Greek, instead of enunciating it as a hard and fast rule, there would be every reason to accept his opinion when thus modified; for he shows clearly enough that the law in question was gradually establishing itself, and that the writers of the purest Attic conform most closely to it. More than this we are not warranted in asserting, though there can be little doubt that, had Attic Greek maintained its purity for one or two generations longer, the rule would have become absolute.

We have already said that Mr. Rutherford's articles on various points connected with the accidence of the verb are his most important contributions to exact scholarship. We may go further

\* *The New Phrynichus; being a Revised Text of the Ecloga of the grammarian Phrynichus. With Introductions and a Commentary by W. Gunion Rutherford, M.A. London: Macmillan & Co. 1881.*

and say that there is scarcely one of these articles which will not repay careful study. To § cccii. is appended a most interesting investigation into the question of verbs which are partly deponent, where it is established that all verbs which refer primarily to a physical process are either deponent throughout or deponent in the future. One can scarcely praise too highly the painstaking industry with which materials have been collected and the extreme clearness of their arrangement. It is refreshing, too, to find that Mr. Rutherford does not think it necessary to work out any elaborate psychological explanation of this anomalous use of a deponent future. The Greeks felt that the meaning was most fitly expressed by the middle voice, and the business of the grammarian is to collect instances and formulate a general rule, that is all. Another interesting, though far shorter, article, is that on the use of the aorist infinitive after *μέλλω*. The facts as here collected go far to prove that the modified opinion as to the rigidity of Attic grammar which we have expressed above is the true one. Phrynichus lays down the rule that *μέλλω* must be followed by the present or the future infinitive, and says that the Syntax which admits of an aorist is "*ἰσχυρὸς βάρβαρος*." We find from the passages quoted by Mr. Rutherford himself that in Attic comedy the exceptions to the rule of Phrynichus are four per cent. of the instances. This leaves an overwhelming balance in favour of the rule, but cannot be said to prove its absolute rigidity. Another case of the same kind is that of the Doric future in *-ομαι*. Mr. Rutherford contends that this form is quite inadmissible in Attic, and attributes its frequent appearance in the manuscripts to the ignorance of transcribers. He shows with a good deal of force that the form in *-ομαι* is far more common when it is protected by the metre than when the quantity of the syllable is doubtful; but he is obliged to allow that in three cases Aristophanes admitted the "Doric form *metri gratia*." But surely that which may be conceded to the exigencies of metre cannot be absolutely wrong in itself, and it seems an extreme step, in the face of *φειδολύμεια*, to read *πυύσεται* for *πνεύσεται* against the authority of every single manuscript. Here again, however, the general truth of the rule may be fairly said to be established. One of the most lucid and convincing of all is the article on the true forms of the pluperfect indicative active, in which the Attic terminations *-η, -ης, -ει, and -εον* are upheld. Here Mr. Rutherford's case is doubly strong, owing to the fact that the best manuscripts are on his side. Dawes's happy emendations of Aristophanes, which were afterwards confirmed by the discovery of the Ravenna MS., are triumphantly cited; but one is tempted to inquire, if the authority of manuscripts on such points is so utterly worthless as Mr. Rutherford would have us believe, what weight can this corroboration add to a conjecture which is already in accordance with a good symmetrical theory?

It is needless to multiply instances either of Mr. Rutherford's great ability as a critic, or of those points on which his opinions seem to pass somewhat beyond the bounds of sober judgment. His work must commend itself to all scholars, and not least to those who in some respects differ from his conclusions, for the thoroughness with which every detail is worked up, and the clear concise language in which his arguments are expressed. We cannot, however, help regretting that he should have here and there condescended to ridicule those whose opinions are at variance with his own, in a manner more worthy of a flippant schoolboy than of a mature scholar. It is true that the traditions of his author support the use of such language. Phrynichus himself says that Phavorinus, the rhetorician, and friend of Hadrian, "picked up the form *ἐπείλευσόμενος* out of the gutter," and Lobeck describes Nuñez, with a contemptuous shrug of the shoulders, as "*Homo Hispanus, non indoctus sane, ut erant illa tempora*." But it is neither humorous nor dignified to talk of "nervelless editors who justly trust the pen of a nodding transcriber in preference to their own reason," or to say of certain persons who are supposed to be delighted at discovering a corrupt form that "such grammarians would have worse fortune if they searched for sparks of reason in themselves."

#### ROSE.\*

IT is something in these days to meet with a novel that is neither immoral, sensational, nor vulgar. There is nothing in *Rose* to shock the most fastidious; the plot of the story will give nobody nightmare, and the characters portrayed in the book are those of refined ladies and gentlemen. Its pages are free from the broad repartees that is now so common in novels of a certain type; the tone of the principal actors in its drama is a high one, and there is a happy absence of fast and pathetic characters. Here and there are passages descriptive of lofty aspirations which are highly praiseworthy; the general spirit of the book is far from frivolous; good people and good things are not sneered at, and the volumes might be fearlessly left on the most stainless drawing-room table—even on a Sunday. It seems almost a pity that such a very nice book should fall into the profane hands of reviewers; but now that it has unfortunately done so, it must meet with the same treatment as ordinary books, and be judged by the common standard.

Few scenes are more common in novels than large country houses (country houses are always large in books), and in reading many stories we seem to stay for the time being with the persons

described. We have enjoyed pleasant visits among agreeable people, when reading the novels of Lord Lytton; we have had great fun at the lively houses described by Whyte Melville; we have met amusing assortments of guests when Mr. Anthony Trollope has been our host. On the other hand, we have read novels which took us in the spirit to stay among uninteresting people at exceptionally dull country houses. All the young people were, in such cases, paired off to make love to each other, and we felt no interest whatever in their love-makings. We were told that certain of the guests were exceedingly clever, but we were never permitted to hold any intercourse with them. Our miserable lot was to act as perpetual eavesdroppers to one or other of the silly pairs of love-makers, to be dragged to their picnics, to follow them in their long tedious rides, and to listen to their billing and their cooing on the terraces and in the gardens. We even had to read their love-letters, and to spend sleepless nights with them, while they bemoaned the hard-heartedness or insincerity of the objects of their affections. The last mentioned is the kind of visit that we were compelled to endure in *Rose*. An ordinary reader can, of course, bring such a visit to a close at once, either by shutting up the book or by active skipping; but, to the conscientious reviewer who reads every word of the work submitted to him, there is no such escape. He begins to think that the dreary visit will never come to an end, and he sighs as he reads, after ten chapters of *Rose* spent at Lord Sanford's, that yet another week has to be gone through before a long threatened archery meeting will take place at the hospitable mansion in which he is being victimized, and that in the meantime he is to be taken to a picnic. He has to bear long descriptions of the singing of the beautiful but designing widow, he is told all about the musical powers of the heroine, and he is carefully informed of the state of the weather. To be candid, *Rose* is a very dull book. It consists of only two volumes, but even in that space it is terribly spun out. It is a history of constant misunderstanding between lovers, who seem in almost every chapter to be on the point of understanding each other, when something always happens to mystify them again. At last, of course, all is cleared up happily, and they do those things that they ought to do for ever afterwards. There is a mystery in the story, which is but ill concealed for a volume and a half. We will not spoil the interest of future readers by divulging it, but we may say that it had much in common with that of Nurse Cripps in *H.M.S. Pinafore*, who, when she had the charge of two babies, "mixed those children up, and not a creature knew it."

The hero belongs to the class of beings known as didactic flirts. He is always lecturing and tutoring his lady-love. He tells her that her mind requires cultivation, and he recommends her to read poetry, although he himself is the prosiest of courtiers. He rarely meets her without snubbing her, and her slightest offences are invariably punished by the severe wiggings of her stern admirer. Our sympathies were more aroused by the scoldings to which the poor heroine was submitted than by anything else in the book. In the last chapter we are told that "every one can fill up for themselves (*etc.*) as it pleases them, the future fortunes of the houses of Sanford and Willoughby." We think we could pretty safely foretell the future fortune of the hero and heroine. They would fight like cat and dog. They were constantly misunderstanding each other in their flirtations, and there was no apparent reason why they should cease to do so when they were married. It is true that the lecturing was all on the hero's side during his courtship, but many married men of didactic tendencies could have told him that the "turning of the worm" in the nuptial home is anything but a matter to jest about. Our hero tells his lady-love with whom he wishes her to associate, and what books she is to read. One of the first things he does with her is to put her through a course of Wordsworth. Curiously enough, another man, who falls desperately in love with the heroine, is also fond of the "invigorating lines of Wordsworth." Both the hero and his rival are excellent young men. Indeed all the love-makers are excellent. A lady says of them, "It is a delightful thing to see such a nice set of young people," "they are all so good and so happy." Best of all, in this Utopia there are no unholy jealousies among the rival admirers. One person, however, becomes naughty, takes to gambling, and makes "an unfair use of his father's name" in certain monetary transactions. Whether he wrote that name on the back of a bill we are not informed. Yet even this prodigal becomes reformed at the end of the second volume. The best, and best described, of all the good characters is, to our mind, that of Mrs. Wentworth. The first four pages of chapter xxvii. in the second volume contain her description, and people who do not care to read the whole novel will do well to glance over this part of it. If all the book were as good as this small portion, we should have no fault to find with it. Mrs. Wentworth is a good, plain, motherly woman; well educated, without being a genius; well read, but unimaginative.

Considering that the principles of this novel are so good, it is a pity that its grammar is not a little better. Whatever the failings of a book may be, one would expect its first sentence, at any rate, to be decently constructed. The opening sentence of the novel under notice informs us that "It was breakfast-time," "and, while Rose Willoughby and their guest, Mrs. Churchill, placidly began their breakfast, Miss Willoughby" did such and such a thing. After some study, it gradually dawned upon us that Mrs. Churchill must have been the joint guest of Rose Willoughby and her aunt, Miss Willoughby, although there is nothing in the sentence to tell us so. A few chapters further on we were again mystified by reading of a certain Lady Sophia that "she was not quite so hard and cynical as

\* *Rose*. A Novel. By the Hon. Mrs. Cradock, Author of "John Smith," &c. 2 vols. London: Chapman & Hall, Limited. 1881.

she usually appeared, or as, indeed, she often really was." We have known many hard and cynical women, but we never yet met with one who was not quite so hard and cynical as she really was. In the second volume there is an account of some theatricals, and the author observes that "every one may have been, for once in their lives at least, in the midst of private theatricals." If an author, "for once in their lives," made a mistake of this sort, one could imagine it escaping his notice as well as that of the publisher's reader; but we cannot understand the same awkward slip occurring again and again, as it does in these pages. In the private theatricals already alluded to, the aforesaid Mrs. Churchill acted with great skill, for, "in truth, she was always acting; and practice makes perfect, we are told. Lord Arnold looked as she did the part of a young, affectionate wife. Her beauty was heightened by her dress," &c. We puzzled our heads for a long time as to how Lord Arnold could have looked the part of a young affectionate wife, before we discovered the hidden meaning of the sentence.

There are a good many fresh-coined words to be found in *Rose*. The heroine is said to have been "un-blundery in her gaiety." What, in the name of Dr. Johnson, is the meaning of the word un-blundery? "Un-snob-able" and "un-send-off-able" are bad enough; but they are at any rate comprehensible, which is more than can be said of "un-blundery." We cannot approve of the substitution of such barbarisms as Milord and Miladi for My Lord and My Lady. If the author considers Miladi permissible, why does she not always spell lady ladi? If she writes milord, why does she not make the hero say to the heroine "midarling, midarest, miown, or miangel"? In the two volumes under notice there are many very sensible remarks; but there are, on the other hand, many sentences out of which it is hard to make any sense. There is considerable confusion, for instance, in the following paragraph:—

There are words conveying thoughts, often spoken without thought, and, as it were, unconsciously; and there are thoughts that rest unspoken, or that are but half-conveyed in words; but how often both words and thoughts in society are but the mere passing things of the moment. The words uttered, perhaps, in a flow of gay spirits; the thoughts themselves as fleeting and as little remembered as the carelessly-spoken words. Perhaps it was so now on this evening of which we speak; and yet some of these words and thoughts were things that had an abiding power, a deep and, it may be, a very mournful import to some of those who now spoke, as it might be, with mere evanescent, un-individualized interest.

The recipe for concocting such a paragraph as the above might be as follows—"Take of thoughts and words equal parts, with a flavouring of evanescent, un-individualized interest. Stir well in a mortar!" In another sentence, a little further on, we read of the sea, that it was "tossing up and down with its endless vagaries of light and shade, its regular irregularities of form, and its unceasing variety of graceful curves and fluctuating intricacies of change, alike, and yet constantly differing." This is, to say the least, rather involved, besides being horribly suggestive of sea-sickness. In the next page it is said that "Perhaps the comparison between this open, happy, youthful love, and the circumstances which impelled a mystery as to the love between himself and Emma," &c. How, may we ask, can circumstances impel a mystery? In the same volume we are informed that, at "an archery," Lord Arnold was "to shoot at the same target with Miss Sanford. As the daughter of the house, and cousin to his future bride, he felt it the proper thing to do."

Although *Rose* may not be faultless, it is a comfortable, motherly sort of book; and if it is soporific, it is also innocent, which is more than can be said for half the novels which are published in these days.

#### FRENCH LITERATURE.

SCOTT observes somewhere in his *Life of Dryden*, as an instance of the improvement of literary morals in England since the seventeenth century, that whereas at that time the announcement that a writer had taken up such and such a subject was a mere invitation for piratical anticipators, in his own day such anticipation was altogether unknown in the case of men of letters of any pretensions to decent repute. It is, to say the least, odd that the letters of the Abbé Galiani should twice have afforded an instance which might seem to show that this etiquette does not yet prevail in France. The first edition, published more than fifty years ago by Barbier, was anticipated by a certain *Sérieys*; and, now that MM. Maugras and Perey have re-edited the correspondence, the appearance of their second volume (1)—the first was sufficiently noticed in these columns a month or two ago—coincides with the appearance in less dignified form of an edition by M. Asse (2). That the two, or rather the three, editors were ignorant of each other's proceedings may of course be taken for granted. Indeed, M. Asse tells us that he knew nothing of his competitors; so that charity will suppose that, after all, the etiquette has not been violated.

The publication, undertaken by various hands, of Saint-Simon's hitherto unprinted works goes on. M. Faugère (3) has just given to the world some more *mélanges* of the most industrious and

astrolibus of dukes, dealing for the most part with the (to him) inexhaustible subject of the privileges of the peerage and the sacrilegious invasions to which they were subject. There is something delightfully Saint-Simonian in this sentence:—"L'hiver dernier a vu naître au bal le mélange des femmes sans filtre avec les tiltrées. . . . bien que cela fut trouvé étrange par qui avait droit de parler avec autorité; ainsi vont toutes choses."

A full and careful account of that singular personage Mme. Guyon, whose influence on many distinguished writers of the eighteenth century from Fénelon to Cowper was so great, has long been wanted. M. Guerrier's book (4) completely answers to the description just given. If it were only for its view of the ever-memorable controversy between Fénelon and Bossuet the book would be worth reading. But the portrait of one of the most remarkable of mystics, and of feminine mystics certainly the most remarkable, with the possible exception of St. Theresa, is its real subject, and a subject ably worked up. The book is not a mere compilation from printed sources, but contains much matter extracted from the manuscript records in which France is so incomparably rich.

M. Duveyrier's brochure (5), for it is little more, is a useful description of what he ingenuously calls the latest "satellite of France." The indispensable accompaniment of a map is, however, wanting.

The publishing house of MM. Didier et Co. has recently produced some very remarkable monographs of considerable extent, dealing biographically with the history of the seventeenth century. M. Chantelauze's works on Marie Mancini and the Cardinal de Retz, M. Bourelly's *Maréchal de Fabert*, MM. Kerviller and Bartélemy's books on Conrart and Séguier, M. Zeller's on the Constable de Luynes, have all been recently noticed here. Now M. Valfrey (6), who has already published a volume on L'ionne's Italian Embassies, publishes another on his negotiations in reference to the peace of the Pyrenees—that peace which was the subject of St. Evremond's masterly letter to Créquy, the first thoroughly literary pamphlet on a great political question that Europe had seen. With certain variations, due to the individuality of the authors, all these books deserve the praise of exact inquiry and of full and careful setting forth of the facts, M. Valfrey's by no means less than the others.

The fourth volume of M. Zeller's elaborate and laborious *History of Germany* (7) deals with the Hohenstauffen period as far as the death of Henry VI. The greater part of the book is of course given to Barbarossa, who has some three hundred out of its four hundred pages. A certain parsimony of citations of authorities of which a history on the great scale cannot possibly be too lavish, is almost the only fault to be found with it from a general point of view. On the other hand, the presence of maps is a welcome feature, and in French histories something of a novel one.

The third volume of M. Gambetta's *Discours et plaidoyers politiques* (8) contains the utterances of eight months only—September 1872 to May 1873—so that the space occupied by M. Gambetta on the shelves of his admirers is likely to be considerable.

The third and fourth volumes of M. Jules Favre's speeches (9) contain not merely the *discours parlementaires*, from which the book takes its title, but also a collection of political miscellanies extending over more than forty years.

We noticed not long ago a reprint of that curious book the *Paris, Rome, et Jérusalem* of the late M. Salvador. Colonel Salvador now comes forward with a volume (10) which is half a biography and half a collection of extracts. It can hardly be said that the subject is of the first interest or importance, except as an illustration of one of the innumerable phases of Jewish mental development in the present day. But as such it has interest.

M. Oscar de Vallée's volume on Andre Chénier and Jacobinism (11) is a book which was worth writing, because few people know much of Chénier except as a poet. Perhaps M. de Vallée has made him a little too much of a far-sighted politician, and he has also not escaped the danger which besets almost all writers on such subjects—the danger of writing with one eye only on the subject and the other on the men and events of his own day. But any honest picture of the results of Republicanism in times past must be instructive and useful in times present, and, as such, his book may be welcomed.

The excellent series of short histories published under the direction of M. Duruy, and which already includes books of such proved value as his own small *Roman History*, as M. Demogeot's *French Literature*, and others, has received an addition, which might have been useful, in the shape of a history of the Ottoman Empire (12), by M. de la Jonquière. Unfortunately the author allows himself

(4) *Mme. Guyon*. Par L. Guerrier. Paris: Didier.

(5) *La Tunisie*. Par H. Duveyrier. Paris: Hachette.

(6) *Hugues de L'ionne et la paix des Pyrénées*. Par J. Valfrey. Paris: Didier.

(7) *Histoire de l'Allemagne. L'empire germanique sous les Hohenstauffen*. Par J. Zeller. Paris: Didier.

(8) *Discours et plaidoyers politiques de M. Gambetta*. Tome 3. Paris: Charpentier.

(9) *Discours parlementaires de Jules Favre*. Tomes III. et IV. Paris: Plon.

(10) *J. Salvador*. Par le colonel Gabriel Salvador. Paris: Calmann-Lévy.

(11) *André Chénier et les Jacobins*. Par Oscar de Vallée. Paris: Calmann-Lévy.

(12) *Histoire de l'empire ottoman*. Par le vicomte A. de la Jonquière. Paris: Hachette.

(1) *Correspondance de l'abbé F. Galiani*. Par Lucien Perey et Gaston Maugras. Vol. II. Paris: Calmann-Lévy.

(2) *Lettres de l'abbé Galiani*. Par E. Asse. Paris: Charpentier.

(3) *Œuvres inédites de St.-Simon*. Par P. Faugère. Tome III. Paris: Hachette.

to speak of recent events in a spirit which is not that of the historian, nor even that of the pamphleteer who is decently careful of his facts. When he says that Sir Henry Layard tried to provoke a conflict between the Russians and the Turks at Tchataldja, that England *escamotait l'Asie Mineure*, that English military organization had not progressed since the Crimean war, he does not exactly inspire confidence as to the accuracy of his statements in matters where it is more difficult to check him.

The well-known book (13) by which M. Mézières acquired his chief reputation has reached a third edition, which it very well deserves.

M. Reclus's account (14) of a surveying expedition in the isthmus between North and South America in which he took part is not very remarkable for graphic power, but is unpretentious and interesting enough. Besides its own merits, it has the advantage of frequent illustrations. The survey, it need hardly be said, had reference to the much talked of canal, as to which M. Reclus seems fully to share the views of M. de Lesseps.

The title of M. Dalsème's book (15) might be roughly translated by that of an English book of a not dissimilar kind, *A Book about Lawyers*. But it is also a book about law, about prisons, about the history of the more famous French Courts, about *causes célèbres*, &c. &c. Such a book must necessarily be desultory, but must be very badly done if it is not more or less amusing to turn over. M. Dalsème is not indeed a very sprightly writer, but perhaps that is nearly as much in his favour as it is against him.

We do not pretend to know whether M. de Pontmartin is tired of the title of *Nouveaux Samedis* or whether *Souvenirs d'un vieux critique* (16) is merely intended to express a somewhat different kind of work. As a matter of fact, it does not describe the book with entire accuracy, though much of its contents fairly deserve the title. Such are articles on Berryer, Gustave Roger, Gudin the marine painter, Paul de Saint-Victor, Léopold Double, &c. But many of the papers are simply *Samedis*, and display M. de Pontmartin's well-known characteristics, his strong political opinions, his highly coloured and indeed somewhat *voyant* style, his power of acrid expression, and his frequent acuteness when he can keep his very numerous Charles the Firsts out of the memorial. We have before owned to a peculiar pleasure in watching the manner of M. de Pontmartin's dealing with M. Emile Zola. The treatment is so entirely suited to the subject, the war is carried so far home into the enemy's country, and the censor is so obligingly ready to belabour his foe with arms nearly as rough and as rude as that foe's own, that the sight of the conflict is refreshing. Not merely does this volume contain a most lively *razzia* on the *Roman Experimental*, but it contains also a "letter to M. Emile Zola" in reply to an article of the latter's (given here in full), wherein the author of *Nana* tries to make fun out of M. de Pontmartin's title of Count. It is, however, obvious enough that the scientific novelist and critic is laughing on the wrong side of his mouth, and the workmanlike manner in which M. de Pontmartin points out the fact to him is delightful in an octogenarian, or something like it. M. de Pontmartin has a good many literary sins to answer for, but he at least deserves such absolution as may be accorded to him *quia multum abominatus est* the filthiest trash in the way of novels, and the most impertinent nonsense in the form of criticism which France has seen for many years.

M. Yveling Rambaud (17) professes, and doubtless feels, a sincere admiration for Leech and a sincere desire to introduce him to French admirers of caricature. He might, however, have found a better means of showing his admiration, and of exciting others to share it, than by printing some inedited drawings of the artist, and by making them do duty as illustrations to a kind of cock-and-bull, pillar-to-post *fantaisie* about nothing in particular. We cannot attempt to give the least idea of the literary contents of *En voiture, messieurs*, which has little more coherence or point than a mediæval *fantaisie*, a Renaissance *coq-à-l'âne*, or an eighteenth-century *amphigouri*, except that it has not the amusing extravagance of either. The drawings are evidently very early sketches made before the draughtsman's hand was at all sure of itself, and will not give the merely French reader the least idea of the matured excellence of Mr. Briggs and the children of the Christmas parties. There are, of course, some studies in which Leech can be recognized, such as one or two drawings of footmen—which, by the way, are still more like Thackeray than like Leech—some sketches in the manner of Rowlandson (there is one which looks as if it were a lost plate to *Dr. Syntax*), a Falstaff, which is either a copy or the original of Cruikshank's, and some unmistakable horses. Indeed, the book is of real interest to eyes already accustomed to Leech's completed work, and doubtless also to skilled experts in art. But for the more general reader (and the fantastic setting of the drawings seems to court such a public), who does not know that work, it can hardly give the least idea of the artist's powers or manner.

The fifteenth number of the *Revue des arts décoratifs* is worth noticing for the two reproductions of sketches for tapestry (18)

(13) *Prédécesseurs et contemporains de Shakespeare*. Par A. Mézières. Troisième édition. Paris: Hachette.

(14) *Panama et Darien*. Par Armand Reclus. Paris: Hachette.

(15) *A travers le Palais*. Par A. J. Dalsème. Paris: Dentu.

(16) *Souvenirs d'un vieux critique*. Tome I. Par A. de Pontmartin. Paris: Calmann-Lévy.

(17) *En voiture, messieurs*. Par Y. Rambaud. Paris: Dentu.

(18) *Revue des arts décoratifs*. Part XV. Paris: Quantin.

from Boucher. One is a fortune-telling scene drawn for the Gobelins; the other, "La noble pastorale," a more artificial, but very beautiful, group done for Beauvais. There are some other noteworthy reproductions of decorative designs or objects in the number, especially one of some poppies in repoussé metal-work.

A weekly paper (19) under a once well-known title has just been started in Paris, we believe by M. Saint-Marc Girardin. It contains a useful summary of the political events of the week, a *chronique* of lighter matters, and articles on single points of importance. From the present point of view, it is perhaps worth pointing out that a paper of the kind, well managed, might not improbably secure a considerable foreign audience, who, without caring to add a French daily paper to their present breakfast drudgery, may wish to see *les choses de France* in a French light.

The author of *La chanson des Gueux* (20) seems to find a considerable public for his eccentric and rather wrong-headed but remarkable work. We have before us an *édition définitive* of the *Chanson* itself cleared of the pieces which brought M. Richepin into trouble, and furnished with one of the virtuously indignant prefaces in which French authors excel under such circumstances, and a glossary of the *argot* employed. There is also a seventh edition of *Madame André*, and a seventh also of the younger book *La Glu*, while the covers promise re-issues of *Les morts bizarres* and *Les caresses*, together with a new work which irresistibly recalls the titles (dear to book collectors) which on the works of the early Romantics announced volumes which, alas! have never appeared. *Les blasphèmes* is the formidable name of this promised masterpiece, and M. Richepin is quite capable of acting up to it. Seriously, it is a pity that a writer apparently of some education, and of undoubted talent, should have chosen and clung to the style which M. Richepin affects—a style which too frequently pays as little regard to good taste as to classical French. The worst mark of the beast is not on M. Richepin. He is not naturalist, and he does not talk rubbish about science and experiment. But though *La Glu* would have been duller and cruder in the hands of M. Huysmans or M. Vast-Ricouard, and though it would also in their hands have been destitute of the poetic touches which half redeem it, it must still be said that it is more worthy of them than of M. Richepin.

M. Louis Ulbach makes the republication of his novel *La Fleuriotte* (21) in a journal (we think a provincial one) the occasion of one of those prefaces in which French novelists delight, explaining the "sincerity" of his work, &c. English readers will probably trouble themselves very little about M. Ulbach's sincerity. It will be sufficient for them that he is not a bad novelist of his kind—which is the judicial-sensational kind—and that his novel is far from a bad novel.

With this exception, not very much can be said for the novels we have before us. Devoted admirers of M. Jules Verne may possibly enjoy *La Jangada* (22). It is a narrative of a voyage on the Amazon, full of learned history and geography. We confess we like Mr. Bates's *Naturalist on the Amazon* better. It is very good of M. Maurice Rollin to indicate by his title (23) what he expects his readers to do; but it is possible that some of them will not feel—it is historically certain that some have not felt—much inclination to burst out laughing. *Dans le tourbillon* (24) is a translation of a Russian novel, printed in such illegible type, and, what is worse, in type so crowded together, that we are frankly unable to speak of its merits from adequate examination. M. d'Héricault's book (25) testifies to some reading in the period, and even contains some sketches of character which are not unskillful; but the author has not escaped the strange influence which seems to weigh on almost all novelists who deal with the Revolution. Perhaps the events are even yet too recent, and their influence too unexhausted, for them to lend themselves well to fictitious treatment. *Expédition* (26) is a morbid and wrong-headed book of the analytic kind, in which the heroine loves the hero so much that she elopes with his rival. *Moines et comédiennes* (27) is a comical instance of how things repeat themselves. Mlle. Hortense Rolland is not quite the equal of Eugène Sue; but her book vividly recalls the time when Quinet and Michelet cheered on the dogs of war against the Jesuits. "Les pères Galorites" are a community of terrible ascoutrals who stick at nothing to secure rich inheritances, and persecute the heroine, Diana de Vaux Bois, who is not very much better than she should be, even to the death. There is a pleasing English nobleman with the highly probable title of Lord Lovely. *Petites misères* (28) is a collection of short stories, most of them written with a moral purpose, which the fiction is made to serve not too unskillfully.

(19) *Le courrier du Dimanche*. Paris: au Bureau du Journal.

(20) *La chanson des Gueux*. Édition définitive. *Madame André*: Septième édition. *La Glu*: Septième édition. Par Jean Richepin. Paris: Dreyfous.

(21) *La Fleuriotte*. Par Louis Ulbach. 2 vols. Paris: Calmann-Lévy.

(22) *La Jangada*. Par Jules Verne. Tome I. Paris: Hetzel.

(23) *Éclats de rire*. Par Maurice Rollin. Paris: Ollendorff.

(24) *Dans le tourbillon*. Par A. Pisemsky. Paris: Charpentier.

(25) *Avantures de deux Parisiennes*. Par Ch. d'Héricault. Paris: Dulac.

(26) *Expédition*. Paris: Calmann-Lévy.

(27) *Moines et comédiennes*. Par H. Rolland. Paris: Patay.

(28) *Petites misères*. Par H. Lafontaine. Paris: Calmann-Lévy.

## THE MEETING OF THE EMPERORS.

THAT the meeting of the CZAR and the Emperor of GERMANY, whether arranged for Dantzic or for Neufahrwasser, or for any other place near the frontier of the two countries, should afford much occasion for comment was inevitable. Ever since the war of 1870 every conference between the three Sovereigns of Eastern and Central Europe, or any two of them, has always been an occasion too good to be missed by students of what is politely called *la haute politique*. As the premises in that august science are usually matters of speculation merely, the conclusions drawn from them enjoy a happy immunity from refutation, if not from criticism. On the present occasion the absence of the Emperor of AUSTRIA from the meeting has naturally been the subject most fastened upon by critics, especially at Vienna. The Austrian capital is at all times a centre of this kind of political discussion in the air, and, for some reason not very easy to determine, there has of late been little goodwill expressed by the chief organs of Austrian opinion towards Russia, whatever may be the state of the relations between the respective Governments. Just as illwill between France and Italy has given rise to and has been fostered by reports of mysterious surveys by French officers on the Italian frontier, so, not many days ago, capital was sought to be made out of the reported arrest of two disguised Russian officers in Galicia. There is said to be a conviction among long-headed politicians that a collision between Austria and Russia in the Balkan Peninsula is only a question of time, and the prophets of evil are at no loss for many other ominous signs and portents. Therefore, a sudden and unexpected meeting of two members of the famous Triple Alliance, at a time and in a place which made it almost impossible for the third to join them, was a godsend to such persons, and they have improved the occasion accordingly.

It hardly needed official disclaimers to show that there is nothing in this meeting hostile to Austria. Germany is still Prince BISMARCK; and with all signs of failing health and breaking temper, Prince BISMARCK has not yet ceased to be the most practical politician living. He has made mistakes, including some grave ones, but he has never made the mistake of giving up a bird in the hand even for the chance of two in the bush, much less for the chance of a single one of less value. Russia is, no doubt, in mere weight and volume as well as in homogeneity and power of resistance, a far stronger power than Austria, but she is not nearly so important as an ally for Germany. So long as the Austro-German alliance lasts, Germany has almost everything that she can desire secured to her. Theoretical Pan-Germanism is satisfied without having to face the problem of incorporating a practically alien people, proud of centuries of independence and domination, and widely separated in tastes and character from their northern kinsmen. Besides, the weight of a great body of non-Germans who are moderately well satisfied with Austria as she is, but who would certainly be restless under German control, is secured to the alliance. For no one except Mr. GLADSTONE—who probably sees in Austria nothing but the Austria of the Italomania of thirty years ago—ignores the fact that the Government of Vienna has for years had a singular knack of contenting and benefiting the motley populations under its rule. They grumble, it is true, and some of them might prefer

independence, but not one of them would prefer Russia or Germany to Austria. What is more, the commercial and geographical importance of the alliance as it stands is unique. Austria and Germany together interpose a solid barrier between East and West, against which even an impossible combination of all the rest of Europe would probably dash itself in vain. Nor is this alliance, as an active Russo-German alliance without Austria would be, a partnership threatening to other nations; so that while it is in itself almost strong enough to defy such a combination as that just noticed, it is practically certain never to provoke it. It is a guarantee of the peace of Europe, instead of, as the other combination, if made without Austria's privity, would be, an earnest of aggression and of war. Nor is so shrewd a judge as Prince BISMARCK likely to be blind to the peculiar rottenness of a Russian alliance at present. Vast as are the resources of the CZAR'S Empire, the war of three years ago showed with what difficulty they can be brought to bear, even when national enthusiasm supports the effort. The character of ALEXANDER III., moreover, is not exactly calculated to inspire confidence in one so little given to that weakness; nor are his few political antecedents, such as the curious pledge in reference to Central Asia, said to be given through the German Government itself to England, and broken as soon as given, attractive. Lastly, Russians and Germans are still, what Frenchmen and Englishmen have long ceased to be, natural enemies. Their mutual enmity may disappear, as a similar enmity has disappeared in the case just referred to; but it exists at present, and, though everything that fair words and friendly acts can do will doubtless be forthcoming on the German side, it is as certain as anything can be that Austria will not be thrown over for the CZAR.

On the one hand, the meeting is a perfectly natural and intelligible one without any sinister suppositions. No fact in recent politics is better assured than the affection of the Emperor WILLIAM for his late nephew, and the lamentable circumstances of that nephew's death must have deepened rather than weakened the sentiment. For, though fear is a passion probably unknown to the veteran sovereign of Prussia and Germany, the profound and semi-religious impression of detestation which the attempts upon his own life have made upon him is sufficiently notorious. The Russian Imperial family, like his own, is the object of the machinations of miscreants, and the bond of common danger draws the bonds of friendship and kinship tighter. Nobody tries to take the life of the Emperor of AUSTRIA. His motley subjects grumble, as has been said, and cabal, and upset Ministries, and sing patriotic songs in half a score of languages, but not the remotest idea of employing dynamite or gunpowder against their Sovereign seems to enter their heads, and he goes about among them as freely and with as little danger as the Sovereign does in England. He can scarcely, therefore, be supposed to sympathise, otherwise than in a kind of benevolent outside fashion, with the holy war against Socialism and Nihilism, which is believed to be the reigning idea of the Emperor WILLIAM, and which the CZAR carries on in the passive sense by shrouding himself in his most out-of-the-way country houses, with a *consigne* as severe as that which guarded the Man in the Iron Mask. It is not at all improbable that if the meeting has any political sense at all, it may be a sense of this kind. Of late, Prince BISMARCK has been reproached with making friends of

the mammoth of iniquitousness, at any rate of reaction. He changed courtesies with the Pope, and has been amiable to bishops. Russia is much more to be depended upon than ally against anarchists than the Church of Rome, PRINCE, who has heard of Ireland and the Land must be very well aware. As his own objection to these gentry is popularly supposed to be (though from a different point of view) nearly as strong as his master's, it is perfectly natural that he should extend the right hand of fellowship to their most irreconcilable foe. The proceeding cannot be taken as an ungrateful return for the courtesies of the present English Government in the matter of Herr MOST, for PRINCE BISMARCK may quote the assurances of that Government itself to the effect that it is on the best of terms with Russia. It cannot be supposed to be unwelcome to Austria, because, as has been already pointed out, the Austro-German alliance is founded on a basis far too solid to allow the Ministers of the Emperor FRANCIS JOSEPH to feel the least alarm. As for France, the operations in which, with the PRINCE's benovolent approval, she has recently engaged in Africa are likely to occupy her for a very considerable time and to leave her little leisure for criticizing European affairs. There is therefore every reason for a *rapprochement* with Russia up to a certain point, and none against it, except the possible disapproval of the comparatively insignificant body of pure Liberals in Germany. The combinations and re-arrangements of the three Empires during the last ten years have been so numerous that a fresh turn of the kaleidoscope may be awaited with few other feelings than a languid curiosity. It may not be an altogether pleasant reflection that if the three together determined on movements prejudicial to England, it would be, as things stand, impossible for us to stop them; but there is at least the comfort that there is hardly any such movement which is not contrary to the interest of one or other of the three, and that, unless PRINCE BISMARCK has taken leave of his wits, the only combination of two likely to be dangerous is impossible.

#### THE ENGLISH BY-ELECTIONS.

THE Conservative party is probably well enough satisfied with its recent victories to regard with equanimity the drawbacks which ought to temper its exultation. No conscientious politician can sympathize with Sir GEORGE ELLIOT since his adhesion to the cause of Irish disaffection. His natural supporters have reason to complain of a sacrifice of principle which appears not even to have been necessary to his success. The moral value of his triumph is greatly impaired by it. Except for his unworthy deference to a mischievous faction, he was in all respects an eligible candidate; and he conducted the contest with good taste and friendly feeling towards a respectable opponent. Mr. LAING, a Sunderland shipbuilder, was probably not so strong a candidate for North Durham as Colonel JOICEY, who, like Sir GEORGE ELLIOT, was largely concerned in the production of coal. Mr. LAING was also comparatively unknown as a politician; and he had but lately been converted to Liberal opinions. Notwithstanding all reasonable allowances, the considerable majority obtained by Sir GEORGE ELLIOT probably indicates a certain political reaction, or at least the subsidence of the morbid excitement which had been caused at the general election by unscrupulous and long-sustained declamation. The return of Mr. LOWTHER for North Lincolnshire has a more unqualified significance. In that county also the Conservative candidate professed opinions which are erroneous in themselves, and which would be fatal to the future interests of any party which might adopt them; but there is no doubt that Mr. LOWTHER was sincere in his advocacy of protective legislation. The tenant-farmers may or may not have been attracted by the flagrant fallacies which Mr. LOWTHER confidently propounded. It is probable that they sympathized with a hearty and outspoken believer in the kind of doctrines which were formerly held by county members and by the class from which county candidates were drawn. It may be added that Mr. LOWTHER possesses considerable ability, though he has not mastered the fundamental principles of political economy.

The collapse of Lord BLANDFORD's candidature in Cambridgeshire is significant and satisfactory. Mr. BULWER, like Mr. LOWTHER, intimated a strong leaning to Protection, though he seems to have been more fully aware of

the arguments in favour of free trade; but there is no reason to suppose that the constituency hoped or wished for the re-establishment of the Corn Laws. It is more probable that they resented the injury which, under the disguise of a boon, has been inflicted on them by the commutation of the malt-tax for a duty on beer. It is probable that there would have been no opposition to Mr. RODWELL if he had sought re-election; and, much to his credit, he had consistently opposed the attempt to recur to Protection, or, according to the novel phrase, to fair trade. In other respects Mr. BULWER will be in all respects a suitable successor to a member who was originally returned by the tenant-farmers against the wish of the local aristocracy and of the London managers of the party. It is possible that the Cambridgeshire electors may not have forgotten an approaching struggle which concerns them more nearly than any supposed conflict of interests between themselves and their landlords. Mr. RODWELL was recommended to their notice and confidence by the valuable services which he had rendered to the Suffolk farmers during a strike of the agricultural labourers. The same class in Cambridgeshire and in North Lincolnshire may have remembered that the present Government, among other assaults on established institutions, is pledged to transfer the county representation from the present constituency to the labourers in their capacity of householders. As the Ballot has practically deprived county gentlemen of the influence which they formerly possessed, the extension of household suffrage to counties would disfranchise the tenant-farmers. The dangers from below are more substantial than the benefits to be derived from legislation against the landlords. The supporters of the Government may perhaps endeavour to explain their failure by the excuse that Lord BLANDFORD was both a stranger and a recent convert to the Liberal party; but the local managers had deliberately accepted his candidature, though Mr. FORDHAM was already in the field; and proselytes have often been preferred by the Liberal leaders to veteran professors of party orthodoxy. Lord BLANDFORD had of late done his utmost to conciliate Liberal supporters by publishing essays to prove that the accumulation of landed property and the hereditary transmission of privilege were grave political evils. The eldest son of a duke could scarcely bid higher for Radical votes.

The return of the farmers to their natural allegiance derives additional importance from Mr. GLADSTONE's selection of the land laws as the next subject of political agitation for the benefit of the dominant party. It is true that he has not pledged himself as to the special grievance which he proposes to redress, or as to the remedy which may be deemed most popular; but his supporters in the press have repeatedly held out to greedy claimants of their neighbours' property the hope that the anomalous legislation of the last Session may furnish a precedent for spoliation in Great Britain. Mr. GLADSTONE's promises are vague enough to encourage the hopes of two distinct classes who aspire to his patronage. The land-doctors who denounce life-estates, settlements, and entails can urge plausible arguments in favour of their projects, but it may be doubted whether they command any considerable support in the country. Tenant-farmers are for the most part wholly indifferent as to the tenure of their landlords; and probably not one in twenty of their number knows whether his farm is held by the owner in settlement or in fee. It may be conjectured that the learned and tiresome essays which from time to time adorn the pages of monthly Reviews have few readers in rural districts. Direct appeals to the cupidity of farmers, in the form of promised fixity of tenure, or of other legislative restrictions on free trade in land, seem likely to be more effective, but they have not produced their intended effect in North Lincolnshire or Cambridgeshire. The vicious interference with freedom of contract which is there proposed by candidates, and perhaps approved by constituents, applies to the sale of commodities and not to the transfer of land. It is probable that in both counties the determining cause of the defeat of the Liberal candidates was a wholesome preference for the cause which had down to 1880 been sustained by the country party. Liberal apologists will waste their time if they rely on the fact that Sir G. ELLIOT, Mr. LOWTHER, and Mr. BULWER profess doctrines which would be ruinous to the Conservative party if they were held by its leaders.

There are in the Liberal ranks differences as wide as

those which separate Mr. LOWTHER from Sir STAFFORD NORTHCOKE. Some of Mr. GLADSTONE's followers are moderate politicians, devoted to the maintenance of proprietary rights and of the existing Constitution. Others, with whom the PRIME MINISTER has not yet openly avowed his sympathy, are revolutionists or republicans, with strong leanings to Jacobinism. The Cabinet itself is less completely united in opinion than the Conservative party; but it is true that the errors of Opposition candidates and members tend to weaken the organization in which they are included. Many of the most intelligent politicians, having hitherto inclined to a connexion with the Liberal party, are alarmed and alienated by projected or accomplished innovations, and entertain a profound distrust of Mr. GLADSTONE. By a natural tendency they would gradually merge in the Conservative party, if it were, as in the days of Sir ROBERT PEEL's management of the Opposition, conducted on sound and rational principles. Their adhesion would become impossible if the Opposition were to pledge itself to the obsolete folly of Protection or the nonsense of fair trade. A serious agitation for the imposition of a Customs duty on corn would exclude from office for an indefinite time the party which might share the opinions of Mr. LOWTHER; and it would render impossible the adhesion of moderate Liberals. Sir STAFFORD NORTHCOKE, in his late speech at Sheffield, approached too closely, not to a vindication of Protection or of fair trade, but to an apology for the victims of economical delusions. It would be a grievous blunder to furnish a heterogeneous and dangerous majority with a just cause in substitution for envy, hatred, malice, covetousness, and general disregard of vested rights.

#### STATE OF IRELAND.

THE state of Ireland has once more become serious. The proceedings attending the Tyrone election and the disturbances at Limerick have naturally attracted most attention; but they are only the most prominent of a large number of incidents, all tending to show that the Land League has declared war to the knife. It is not very difficult to understand why Mr. PARNELL has put forth such apparently disproportionate energy in the assault on Tyrone. The position was one in which he could, from his own point of view, hardly lose much, and might gain a great deal. Defeat could not be considered very damaging; victory would have added enormously to the prestige of the Land League. It is true that he has not succeeded in seating his man; that he has not even been able to carry out the avowed secondary part of his scheme and defeat the candidature of Mr. DICKSON. But he probably had not the slightest hope of the first result, and he has missed the second so narrowly that his followers will be nearly as much delighted as if he had won it. Mr. RYLETT was a complete stranger to the country—known only as a zealous servant of the Land League. As a Unitarian he was likely to be unpopular both with Roman Catholics and Presbyterians, who divide the anti-Orange vote of Tyrone between them. If he had any other characteristic, it was a leaning to the nationalist ideas which in one form or another underlie the Land League programme. But Tyrone, if not so entirely devoted to unity with England as the counties east and north of it, is certainly not nationalist. On the other hand, Mr. DICKSON was not merely a man of great popularity in Ulster, and a representative of the party whose strength in the county was shown by Mr. LITTON's return. He directly represented the Government which has just given the electors of Tyrone a bribe estimated by Mr. PARNELL, a most unwilling witness, as equivalent to a permanent remission of twelve per cent. of their rents. Yet Mr. PARNELL has succeeded in polling nearly a thousand votes for his own man, and has failed only by a few score in disappointing the candidate who presents himself to receive the reward of the Government largesse. It is an entire mistake to compare, as some critics have compared, the RYLETT votes with those for Colonel KNOX and Mr. DICKSON, and to say "What a defeat for Mr. PARNELL!" The point is that he has effected a lodgment in that part of Ireland which was supposed to be impregnable to him. The campaign, too, has enabled him to develop more definitely than would otherwise have been possible the new programme by which he hopes to outbid the Government, and to render the Land Bill a mere stepping-stone to further his own pro-

gress. The entire abolition of rent, which was talked of, seems to be postponed in favour of the carrying out of a novel interpretation of the new Act as to improvements—an interpretation which, it is hardly needful to say, the Commissioners have not adopted in the Summary just put forth, and are not likely to adopt in actual practice. According to this interpretation, the improvements in virtue of which no rent is to be payable are any improvements effected by the tenant's predecessors, not merely in title, but in mere holding for some centuries past, and all increase of rent effected during that time is to be struck off. Mr. PARNELL calculates that while the Act would reduce Irish rents from seventeen millions to fifteen—a curious commentary on the reiterated statements of Mr. GLADSTONE and his partisans that nothing is to be taken out of the landlords' pockets—his plan would reduce them to some two or three millions; that is to say, the soil would be handed over to the tenants at a rent-charge for the whole acreage of Ireland of about half-a-crown per acre. The bait is a tempting one, and with the more reckless and dishonest of the tenants the proposal may certainly be counted on as a card likely to trump the Government lead.

It is not necessary to suppose that the Land League has given definite and specific orders for a renewal of violence throughout Ireland, in order to recognize the fact that such a renewal has undoubtedly taken place. When a country is so thoroughly under terrorism as the greater part of Ireland is—when grown men and free citizens can write letters like that most ludicrous and yet most pathetic one published a day or two ago, in which the writer says, "I am exceedingly sorry for having earned Boycotting. I ask to be forgiven, and will be good in future"—a very slight impulsion at head-quarters is sufficient to set the ball of outrage and crime rolling. The Limerick disturbances, moreover, show a spirit in the dregs of the populace, as well as in the police, which is to a great extent new. When, last year, troops were employed to protect the original Boycott expedition, it was noticed that little, if any, ill feeling was shown against them by the people. They were supposed to be doing their duty, and were let alone. This seems now to have changed. In almost every quarter of the South of Ireland the troops (especially if their regiments are definitely English and Scotch regiments) are insulted, waylaid, and attacked on every possible occasion; and the feeling of exasperation likely to be produced by this in such young men as most of our soldiers are now may easily be appreciated. But that exasperation seems, at Limerick at least, to have at last spread to the much-abused and hardly-pressed constabulary. Until a regular official inquiry is held, it is impossible to say whether the police at Limerick did or did not get out of hand, and fire without, or even against, orders. The Land League and National organs, which assert the fact, are utterly unworthy of credit, of course; but it does not seem to rest on their testimony alone, and it is unfortunately anything but improbable in itself. As the present policy of the Land League can only lead to the dispossessing of a large number of tenants, the police will naturally become more obnoxious than ever, and the chances of affrays, even more sanguinary than that of Sunday, will grow with their growing unpopularity. The suggestion which has been thrown out for an alteration in their armament seems worthy of serious consideration. Rifles and bayonets have the disadvantage of being almost useless except in the last resort, and in that last resort unnecessarily deadly.

In a prospect which is decidedly gloomy, the brightest spot is perhaps the address, no less politic than generous, with which the Marquis of WATERFORD has accompanied the issue to his tenantry of the Commissioners' Summary of the Land Act before referred to. That Summary is, on the whole, very fairly drawn up, exhibiting the benefits conferred on the tenant clearly, but not exaggerating them, and perhaps calculated to neutralize the unfavourable opinions as to the probable conduct of the Commission which might have been formed from the announcement of the appointment of Assistant Commissioners who are certainly not biassed in the landlords' favour. In order that the Act may work, fairness on the part of the Commissioners, willingness to avail themselves of it on the part of the tenants, and a disposition to accept the inevitable, and to make the best of it, on the part of the landlords, are indispensable. The first must be presumed to exist until it is shown not to exist.

Of the third a happier prerogative instance could hardly have been shown than the example set by Lord WATERFORD. He insists, and is right in insisting, on a proper arrangement being made in respect of the past; but, this being done, he offers to meet the tenantry half-way in the amicable establishment of statutory tenancies, and even goes so far as to promise reinstatement to two evicted tenants. Lord WATERFORD has at the same time come forward heartily to support the proposed Exhibition of Irish products, a proceeding from which no very great practical good may result, but which, if it were left in the hands of the Land League, might be made an engine for working positive evil. By thus assuming the initiative, and putting himself in his proper position as a leader of the people, ready cheerfully to obey the law, such as it is, and not to wait sulkily till it extracts from him what it can, Lord WATERFORD has earned the respect and gratitude of Irishmen and Englishmen alike. If the majority of landlords follow him, the very firmest portion of the present standing-ground of the Land League will be cut from under its feet. But it will still have a strong hold, partly by terror and partly by interest, on the reckless and dishonest, the greedy and the ignorant, whose numbers are unfortunately not small in Ireland. It is sufficiently obvious that this hold will be used and abused to the uttermost. The *de facto* Government of Ireland is not at all likely to give up the reins without a desperate struggle. What is more, it is but too likely to succeed in holding them unless the other Government shows at last a determination to enforce the law and to preserve order. It must be a subject of the deepest regret to every well-disposed person that as yet but few signs of any such determination are shown. The arrests effected under the Coercion Act were well enough in their way; but then Mr. FORSTER seems to think that, so long as he does not let his prisoners go, his duty is done. It is not done, and will not be done until the terrorism of the Land League is entirely broken. At present that terrorism exists in force as full as it ever possessed, and there are but too good reasons for thinking that every day does something more to transform the movement itself from a simple agitation intended to further designs on private property to a practical rebellion against the sovereignty of England and the unity of the Empire.

#### THE FRENCH IN TUNIS.

THE virtual annexation of Tunis has thus far not been a profitable experiment, though there is no doubt that the principality will become permanently a French possession or dependency. The result has been contemplated for many years, and it might probably have been attained by more gradual methods on easier terms. Italian rivalry was not immediately formidable to France; and nothing was gained by the dissatisfaction which was naturally produced in England. One of the most awkward and most genuine explanations of the sudden interference with the exercise of the Bey's authority was contained in M. ST.-HILAIRE's statement that the local tribunals had given decisions unfavourable to French litigants. He was understood to refer to the rights in dispute between Mr. LEVY, an English subject, and a French Joint-Stock Company. It would be rash to express an opinion as to the merits of the case, or even as to the law by which it ought to have been decided; but the result is in a high degree suspicious. The former French Consul, now Resident Minister and real ruler of Tunis, has caused the suit to be transferred to a tribunal of his own choice, which has since, as might have been expected, given judgment in favour of the French Company. The decision, taken in connexion with M. ST.-HILAIRE's language, furnishes some excuse for the comparison which French opponents of the Government have drawn between the Mexican expedition and the JECKER bonds on one part and the annexation of Tunis with the Enfidu lawsuit on the other. It is of course possible that Mr. LEVY may not have been entitled to pre-emption of an estate adjoining his own; and it is not improbable that JECKER's claim on the Mexican Government may have been tenable. The private interest and the jobs with which it may have been connected were not in either case the primary cause of a doubtful enterprise; but it was unfortunate that the courtiers of NAPOLEON III. or the clients of M. ROUSTAN should have profited by a questionable policy.

The Kroumirs, whose encroachments on French territory were in the first instance to be repressed, have for some time been forgotten. Some French troops which were sent into their country met with no opposition; and the Kroumirs are as much or as little to be feared as before the beginning of the present complications. No explanation has been given of the relation between the supposed Kroumir outrages and the assumption of supreme authority by the French Consul. The Bey had perhaps not made vigorous efforts to keep the frontier tribes in order; but the laxity of a petty Mahometan Government is not surprising. If the French thought it worth while to punish the Kroumirs, the Bey would have made no objection, although the expedition might perhaps temporarily have violated the territory of Tunis. Not content with the arguments derived from the Enfidu lawsuit and from the Kroumir irregularities, M. ST.-HILAIRE further announced that it had become the duty of France to improve the administration of Tunis, and, generally, as in her own African possessions, to promote the spread of civilization. It is an excellent thing to civilize imperfectly-developed communities, but the rights which are professedly founded on the duty of diffusing intelligence are inconveniently vague and elastic. The same reasons might justify a French or Russian conquest of any part of the Turkish Empire, which is greatly in need of improvement. The English Government wisely declined to offer any objection to the annexation of Tunis, as long as its own treaty rights were respected; but Tripoli might, according to M. ST.-HILAIRE's theory, have required the same treatment as Tunis, with the result of disturbing the temporary equilibrium which has been established in Egypt. It accordingly became necessary to warn the French Government that the further extension of its cosmopolitan benevolence would not be regarded by England with equanimity. M. ST.-HILAIRE returned a satisfactory answer to the effect that the frontier of Tripoli would not be passed by French troops, even if it became necessary to repel aggressions on the part of the bordering tribes.

The effect of the wanton annexation of Tunis has been to irritate the large Mahometan population of all Northern Africa. The Arabs have in many districts committed acts of hostility against the French, and the subjects of the Bey not unreasonably think themselves relieved from their allegiance. Unprotected settlements have been exposed to plunder and outrage; and French detachments have been threatened with opposition, and in one or two instances have been compelled by superior numbers to retreat. The disturbances began during the hottest season of the year, when it was impossible or difficult to pursue Arab marauders. In consequence the revolt has spread to the frontier of Morocco, and it will scarcely be repressed except by a regular campaign. There is no doubt that success will be secured without any ruinous drain on the comparatively inexhaustible resources of the French Republic; but the sacrifice of life and treasure which must be incurred will have been wholly gratuitous. It has been found that the army, although it has of late years been entirely reorganized, has not furnished the necessary detachments without some strain and complication. Complaints have been made of imperfect discipline, and of a want of skill and vigour on the part of superior officers. The losses by disease have been comparatively heavy, although the service has thus far been of an ordinary character. When the temperate season begins, the French troops will undoubtedly assert their superiority; and, indeed, they have already, in almost every instance, repelled attack with little loss; but there is small glory to be acquired, and it is possible that war even with African tribes may not prove popular in France. A quarrel with Morocco would extend the range of operations, and render necessary the despatch of additional reinforcements. The African complications have already on one occasion affected domestic policy. The late elections were hurried on because the Government was unwilling to appeal to the constituencies while war was proceeding. It has often been observed that universal liability to military service would scarcely be tolerable in a State which had to employ its forces in foreign and remote regions. The French army has been organized for purposes of national defence, and for the peaceable occupation of Algeria. A chronic state of warfare in Africa would produce much dissatisfaction.

It argues no unfriendly feeling to cultivate a hope

that the present troubles may impress French politicians with the impolicy of reviving national restlessness and ambition. The late proceedings in Tunis would have been regarded in England with less disfavour if they had not seemed to indicate a departure from the deliberate policy of the last eleven years. For almost the first time in several centuries there has during that period been no reason to apprehend disturbance promoted by France. The covetousness of foreign territory which was stimulated by M. THIERS, and fitfully encouraged by NAPOLEON III., has made room for an indefinite hope of recovering at some future time the German provinces which had long been regarded as portions of France. The goodwill of England was conciliated by the removal of all fear of collision with a Power which seemed to be exclusively devoted to the cultivation of its own internal prosperity. When a clever writer described an imaginary invasion of England, the supposed victors in the battle of Dorking were not Frenchmen, but Germans. The great increase of the wealth of France, and even the formation of a powerful army, have been watched in this country with unbroken complacency. The sudden determination to extend French dominion in Africa naturally caused a feeling of unwelcome surprise. The enterprise implied an indifference to the friendship, not only of England, but of Italy; and the approval of French encroachment which was attributed to Prince BISMARCK was not reassuring. It is now too late to hope that the independence of Tunis will be restored. The Bey's troops are more likely to join the insurgents than to aid in the suppression of the revolt, which is probably, in spite of his professions, not distasteful to himself. The campaign which is about to open will be regarded with but faint curiosity, because its issue cannot be doubtful. The best result would be a conviction produced in the French mind of the advantages of peace.

#### LOSS OF THE TEUTON.

IT is singular, and not altogether satisfactory, to contrast the impressions produced in this country by a railway accident and by the loss of a great passenger steamer. If ten or twelve lives are sacrificed in a collision there is a general expression of passionate indignation against the Company which has, or is thought to have, neglected necessary precautions, and a demand for prompt legislation. The Companies have, in almost every case, to compensate those who have been injured and the families of those who have been killed, and juries show little mercy to the great corporations whose officials have been guilty of carelessness, or have endangered life by parsimony. It is natural and just that this strong feeling should exist, and no one can wish that it should be weakened, or that the smallest disregard for the safety of passengers should go unpunished; but it seems strange that, while so much emotion is caused by loss of life on land, so little is aroused by far greater loss of life at sea. In a bad railway collision fifteen or twenty people may be killed. If a steamer goes down, a hundred and fifty or two hundred passengers and sailors may be drowned; but, strange to say, the greater catastrophe causes far less excitement than the less. General regret is expressed for the victims; but there is no explosion of popular feeling against the owners, who, unlike the Railway Companies, are not usually obliged to compensate the families of those who have perished. It seems to be thought that shipwreck is an unavoidable casualty, and that people who go to sea know that they run a certain risk, and are willing to take their chance. There is some foundation for this view, inasmuch as passenger ships are occasionally lost through mischance against which no skill could provide; but nevertheless it should not receive, as it practically does, a general, if tacit, acceptance. The losses of passenger vessels have been in too many cases due to preventable causes, to causes quite as preventable as those of railway disaster; and when an accident has occurred which might have been avoided, there should be at least as strong a feeling against the Steamship Company which has drowned its hundred as there is against the Railway Company which kills its score; and the owners of a vessel ought to be made liable for the loss of life they have caused in the same way that the owners of a railway are made liable. In one respect, indeed, the former are greater sinners than the latter. Railway Companies, badly as they behave in many re-

spects, do not make fallacious statements about the means adopted to ensure the safety of the trains. They do not say, for instance, that they have perfect continuous brakes while they really have but very moderate brake-power. With ships the case is different. Whenever a great passenger steamer is launched, the public is ostentatiously informed that she is divided into a number of water-tight compartments, so that in the event of a leak, a bump, or even a collision, the vessel will still be comparatively safe. When an accident happens, these compartments usually fail, and the vessel fills and sinks in the ordinary way. The reasons why they afford so little protection are perfectly well known to those who are conversant with shipbuilding; but of course the great mass of passengers are quite ignorant on this subject, and they are habitually deluded about one of the most important safeguards against the dangers of the sea. In other respects the construction of the great merchant steamers is defective; and there is no exaggeration in saying that the loss of life which has been caused by the wreck of these vessels has been in great part due to bad building. It may be added that disaster has also in no small number of cases been in part due to the reckless navigation which is tolerated, if not encouraged, for the sake of quick passages. Quite as much to blame as the Railway Companies have some of the Steamship Companies been, and it is not a little strange that the public judgment should be so severe on the former and so clement with regard to the latter.

In the case of the *Teuton* a large number of men, women, and children seem to have been lost owing to the faulty management of a faulty vessel. The story of the disaster as it stands at present is indeed a most singular one, and it is greatly to be hoped that the official narrative may bring to light some facts which will tend to show that there was moderate precaution in shaping the vessel's course. According to the narratives which have been received, the *Teuton* arrived in Table Bay on the 29th of last month, and sailed on the next day for Algoa Bay and Natal. At 2 P.M. cross bearings were apparently taken, and the course set, Cape Point being then eight miles distant, bearing due north. With two slight variations of course, the vessel steamed on during the afternoon, the headland known as Danger Point being passed at 5.30, at a distance of five miles. At 7.20 the vessel suddenly struck, off Quoin Point, the land being then about four miles distant. She was backed off, seemingly without any difficulty, and the captain steered at once for Simon's Bay, no immediate danger being feared; but in spite of the bulkheads which were thought to give her safety—in spite, it may be presumed, of the pumps concerning which, strangely enough, nothing is said in the report—the water gained steadily, and the speed of the vessel decreased as she sank lower and lower. At 10 P.M. the boats, which had been previously got ready and provisioned, were lowered into the water, and some women and children were immediately sent into one of them. A second boat was receiving its living charge when a strange catastrophe, as yet but imperfectly described, occurred. One or both of the engine-room bulkheads suddenly gave way, and the last reserve of buoyancy being immediately annihilated, the *Teuton* sank like a stone, dragging down four of the boats in her vortex. Into the other three some of the crew and passengers, who were either not sucked down by the ship, or rose again to the surface, managed to scramble, and they reached the land in safety.

Unless the official inquiry should bring to light many important facts at present unknown, it is almost impossible to avoid one painful and obvious conclusion respecting this terrible disaster. From all that is at present known, it seems clear that the loss of the *Teuton* was due to bad navigation, which took her aground, and to defects of construction, which caused her to make water much more rapidly than she ought to have done, and then to sink quite suddenly. Why she was kept so close to the land it is not easy to understand, except on the supposition that everything was sacrificed to a rapid passage. The short voyage from Table Bay to Algoa Bay ought apparently to be quite free from danger if ordinary precautions are observed. The coast is well lighted, and there is no reason for supposing that the charts are imperfect. According to a correspondent of the *Standard* who apparently is well acquainted with the matter he treats, the late Astronomer-Royal at the Cape, Sir THOMAS MACLEAR, took the trouble to lay down a perfectly safe course from one bay to the other. It is known

that there is an extremely dangerous reef off Quoin Point, and a vessel belonging to the same company that owned the *Teuton* was lost on it in 1875. When a ship is taken at night within four miles of a coast off which there is known to be a reef of considerable extent, it is clear that risk must be incurred; it also seems clear that the only reason for incurring that risk must be the wish to shorten by a few hours a very short passage. It may perhaps be proved at the official inquiry that the reef is not quite accurately laid down in the charts, or that there were special reasons for making a quick run; but at present the only possible inference from the accounts which have appeared is that the steamer was kept much too close to a dangerous coast, and grounded in consequence. It is worth notice that when the *Teuton* was near what is known to be a dangerous reef, both the captain and the first mate, whose watch it was, were below, and that the vessel was in charge of the third mate, who probably had much less knowledge of the coast than either of the other two.

The sinking of the *Teuton* within some three hours after she struck was due to the failure, almost invariable in these cases, of the bulkheads. It is said that the vessel was "protected" by seven of these, and we presume, therefore, that she was supposed to be divided into a number of water-tight compartments. What the height of the bulkheads was in the *Teuton* has not been stated. In too many cases they extend but a very little way above the load water-line, so that if one compartment fills and thereby brings down the vessel, the others necessarily fill also. If the *Teuton* had seven bulkheads, there must have been three compartments on one side of the engine room, and four on the other. All these had seemingly filled at the time when the boats were lowered, and then finally the engine-room bulkheads gave way with a crash. The catastrophe shows, as so many other losses have done, that the supposed security obtained by the bulkheads is illusory, and that iron vessels fill with terrible rapidity when once there is a hole below the water-line. Now it is perfectly possible to divide a vessel into compartments which are really water-tight; and what the loss of the *Teuton* suggests is that the inspection of vessels destined to carry large numbers of passengers for long voyages should be far more searching and severe than it is at present, and that information accessible to all should show what precautions have been taken in constructing vessels to ensure safety. It is hopeless, however, to expect that any necessary measures will be taken unless public feeling is more deeply stirred by these great disasters, and unless the same strong and just indignation which is aroused by a railway accident is manifested when a passenger steamer is lost. Whether any legislative or administrative measures can put a stop to the practice of running risks in order to make a quick passage may be doubted; but here, again, public opinion might have a most healthy effect, and a general expression of vigorous condemnation, enhanced by a few verdicts with heavy damages, would have a wonderful effect in moderating the zeal of managers and captains who are bent on giving lines to which they belong a good name for speed, at all hazards.

#### FRENCH CONSERVATISM.

IT is four years since M. THIERS died, and at the anniversary service which was held this day week exactly twenty-two persons assisted, including the servants of the family. A larger attendance would have been obviously inappropriate. Neither Royalists nor Bonapartists can have any specially tender recollections of M. THIERS, and the Republicans are naturally anxious to forget him as completely and as quickly as possible. So long as they remember him they cannot well escape from one of two humiliating alternatives. Either they were altogether in the wrong when they looked to M. THIERS as their leader, or they are altogether in the wrong now that they have rejected his counsel. They are doing the very things which M. THIERS most persistently warned them not to do, and they are depriving the Republic of the precise character which he always declared it must retain if it meant to live. M. THIERS was not gifted with infallibility, and it is quite conceivable that in saying this he allowed his wishes or his prejudices to overpower his judgment. This is not a plea, however, which can be very well put forward by those who called themselves his followers. That the

Republic must be Conservative was the creed of the party quite as much as of the leader. Consequently, since the party has discovered that the Republic must be Radical, it has no choice but to acknowledge either that it was wrong then or that it is wrong now. It may have been wanting in enlightenment not to ally itself with the Extreme Left years ago, or it may be wanting in courage not to refuse that alliance to-day, but it cannot clear itself of both accusations at once. There must be a fair number of Republicans to whom either admission is exceedingly distasteful. The dread of Radicalism which they once professed is not so entirely allayed that they can honestly pity themselves for having ever entertained it. Yet, if they were right in fooling it while M. THIERS lived, there is nothing in what has happened since to make it needless to feel it now. The genuine convert feels a hearty distaste for his former beliefs, but the moderate Republican of four years ago is only half at his ease in that Radical eddy which he no longer attempts to stem. All that he can do, therefore, is to put the facts behind him, and persuade himself, if he may, that opposites are not so very opposite, nor contraries so very contrary. In one respect he is undoubtedly favoured by fortune. He has in M. GAMBETTA a politician who will keep him supplied with an endless variety of phrases that seem reassuring and are unmeaning. The speech at Neunbourg the other day was full of them. M. GAMBETTA wished to comfort his moderate allies, and he completely attained his end. He reproduced in substance Mr. BRIGHT's reminder that six omnibuses could not be taken abreast through Temple Bar. The Republic must go on to some undefined goal, but it must move only one step at a time. This is all that a Conservative Republican—as the term is now applied—wants to reassure him. He asks no questions about the contents of the omnibuses, and he is seemingly quite indifferent as to the direction in which the Republic is moving. The important thing is that the six shall approach the gate in succession instead of all at once, and that he shall be allowed to walk blindfold instead of being made to run. Even the reactionary Right, short-sighted and prejudiced as in many ways it is, is more intelligent on this head than the Conservative Republicans have shown themselves. The Right has at least the wit to see that the six omnibuses will only hinder one another, and that a man who finds himself approaching the edge of a precipice is more likely to be startled into caution if he is running at full speed than if he is sauntering at a foot pace. If M. GAMBETTA proposed to abolish the Senate, to rescind the Concordat, to reduce the term of service in the army, to make the magistracy elective, and to do all this in the year 1881, he would be a less dangerous adviser than he is when he is content with making an advance in each of these directions, and with making even that by easy stages.

It is true that the Conservatives who do not call themselves Republicans are, in their own way, quite as incapable of useful or intelligent action as the Conservatives who rightly hold that their business is to protect the Republic against revolutionary violence of all kinds. If in 1873 the Right had supported M. THIERS instead of overthrowing him, and had devoted itself to strengthening what remained instead of dreaming of impossible restorations, things would never have come to the pass in which they now are. Nor is there the faintest evidence that the Right has discovered its mistake. The attempt to create a Conservative Opposition at the late elections was an entire failure. The various sections of which it was sought to compose it thought a great deal more of their facings than of their uniform. They would be Conservatives if by that was meant being Legitimists or Imperialists; but as to sinking these distinctions, and making a common effort to save the Republic from going from bad to worse, they would have none of it. Even consistent Royalists were rejected as candidates by the friends of the Count of CHAMBORD because they would not make the restoration of the Monarchy the declared object of their policy. Under these circumstances the wonder is that a single seat was carried by the Conservatives. They had insisted on allying themselves with two unpopular causes, and they have reaped the natural consequences of their imprudence. If there was anything certain in French politics it was that the great body of the electors are not prepared to tolerate any reaction as regards the institutions under which they live. Republicans they are, and, as at present advised, Republicans they mean to continue. In this particular instance it was more than

commonly easy to put aside any issues which might have the effect of dividing the Opposition. M. GAMNETTA and his friends had made no secret of their determination to demand a revision of the Constitution, to procure, if not the abolition of the Concordat, at all events its administration by the State in a very unfriendly temper towards the clergy, and to make some serious inroad upon the independence of the magistracy. Here was a plain issue upon which it would have been possible to build up a Conservative Opposition and to have furnished it with an intelligible programme to put before the electors. Even if the electors had shown no more disposition to give this programme active support than they have shown in the case of the Legitimist and Bonapartist programmes which have actually been constructed, a beginning might have been made for the future. The electors might have been fairly warned of the measures which the Radicals have in store, and so have been at least disposed to take alarm when they see these measures actually brought forward. It must be admitted, however, that, so long as the French Conservatives show such entire indifference to the fortunes even of the few candidates who have a chance of being elected, it is not to be expected that they should take any pains to get the right sort of candidate. In two divisions of Paris there seemed to be a chance, at all events, that the Conservative candidate would be successful. M. HERVÉ was in all respects an admirable candidate, and the only reason why he is not now one of the deputies for Paris is that on the 21st of August the Conservative electors were at the seaside or taking the waters. They did not care enough about an election which they professed to think so critical to come home for a night in order to save one division at least of Paris from the Radical invasion. So far as any trouble they chose to take in the matter went, the *Scrutin de liste* might have become law, and all Paris might have been made a single constituency. They threw away the weapon which the retention of the *Scrutin d'arrondissement* had put into their hands, and allowed a constituency which they might have made their own to fall under the sway of the enemy. In another division the enthusiasm of the Conservative electors was vigorous enough to bring them to the polls on the 21st of August, but it was not vigorous enough to make them repeat the sacrifice on the 4th of September. If M. GODELLE had retained in the second ballot the same number of votes that he managed to secure in the first, he would be one of the deputies for Paris, and the Extreme Republicans would not have been able to present an unbroken front in the capital. A party which will not make two journeys in a fortnight to secure a great public end deserves the tremendous defeat which it has just sustained.

#### LORD GREY ON RECIPROCITY.

LORD GREY'S letters on the vicious principle of commercial reciprocity are admirable specimens of clear and conclusive reasoning. A veteran confessor of a faith which was preached in his youth, and which is already undergoing a process of corruption, Lord GREY insists on the truth of a simple doctrine which admits of no exceptions. In common with Lord OVERSTONE, like himself an orthodox economist, Lord GREY protested even in 1860, when the French treaty had been recommended to popularity both by its immediate tendency and by the reputation of its author, against an acceptance of the fallacies of which it was designed in some degree to counteract the effect. Mr. CORDEN'S convictions were the same with Lord GREY'S; and his apparent inconsistency admitted of strong excuse, if not of entire justification. The policy which had been steadily pursued in England from the time of Sir ROBERT PEEL'S Administration had already given so much earnest of success as to win over many foreign proselytes. One of the most intelligent of their number, then exercising almost absolute power in France, wished to convince his countrymen by experience of the benefits of free commercial intercourse; but the ignorant prejudice which then as now prevailed in France raised a doubt whether even the most complaisant of representative bodies would approve a rational tariff at the bidding of the EMPEROR. Either by design or by accident the Constitution which had been devised a few years before included a provision by which the Government could evade the necessity of legislative sanction. The EMPEROR had retained to himself absolute

control over diplomatic engagements; and consequently he could by his own prerogative conclude a treaty for the regulation of the tariff. Mr. CORDEN on one of his visits to Paris was invited by NAPOLEON III. to co-operate in the trial of his plausible experiment as to the possibility of introducing a more enlightened commercial policy into France. Having consulted his own Government, Mr. CORDEN, with the cordial sanction of Mr. GLADSTONE, then Chancellor of the Exchequer, undertook the negotiation, for which he would have been admirably qualified if only the entire undertaking had not been inconsistent with his most cherished principles.

M. ROUHER, in seconding and executing the scheme of NAPOLEON III., thought himself obliged to humour the popular prejudice by affecting to treat as costly and burdensome concessions fiscal reductions which were primarily beneficial to French consumers. Both the EMPEROR and his Minister were far in advance of the present rulers of France, and probably they would have preferred the method of domestic legislation to an ostensible bargain with a foreign Government; but they could not afford to incur the risk of a defeat which might in other respects have compromised the Imperial authority. Mr. CORDEN necessarily became their coadjutor or accomplice in a harmless plot against one of the few constitutional restrictions which had survived the events of 1851. Lord GREY attributes some blame to the English representative for the provocation which may have been given to the opponents of NAPOLEON III.; but at that time the Empire seemed to be popular, and it was universally accepted. The Orleanists, who had always opposed Free-trade, were altogether powerless, and the Republican party had no bond of union except resentment against the Empire. It is now evident that Mr. CORDEN and Mr. GLADSTONE made some mistakes; but it was then impossible to foresee all the consequences of the Commercial Treaty. There is some difference of opinion as to the dexterity exhibited by Mr. CORDEN in manipulating the details of the agreement. M. ROUHER could not fail to understand that his English colleague had no serious objection to reducing English Customs duties to the lowest point. At the same time it was certain that the clamour of French producers would be less formidable in proportion to the impediments which were placed in the way of importation from England. NAPOLEON III. and M. ROUHER probably hoped that before the expiration of the treaty sound economic doctrines would have made some progress in France. It may even have seemed possible that in twenty years a French Legislature might be inclined to reduce Customs duties without stipulating for an equivalent. In the result an absurdly unequal bargain, if it was to be only considered as a bargain, was concluded between the plenipotentiaries. The immediate advantage to trade contented English manufacturers; and Mr. GLADSTONE expatiated with copious and persuasive eloquence both on the commercial benefits of the treaty and on the social blessings which were to result from the increased consumption of light claret.

As the term of the treaty approached its close, almost all French politicians concurred in the opinion that it would be expedient to obtain additional concessions from England. M. THIERS, who was profoundly ignorant of the rudiments of economic science, stimulated by every means in his power the vulgar delusion. His successors have included in their number some professed supporters of Free-trade; but the Government for the time being has almost always truckled to the producers, at the expense of the consuming mass of the population. The impression which, according to Lord GREY, was a necessary consequence of the negotiation of a commercial treaty proved to be both general and permanent. French Ministers were convinced that the limited facilities afforded to English trade were too valuable to be sacrificed, and that they had the opportunity of acquiring a cheap popularity by imposing additional restrictions. The treaty was grudgingly prolonged for six months, that time might be afforded for negotiation; but during the last Session of the Legislature which has since been dissolved the MINISTER OF COMMERCE deliberately contrived a plan of extorting concessions by forcing the English Government to conclude a treaty in a hurry. The Assembly was not unwilling to extend the term, but M. TIRARD insisted on fixing November 8 as the date of final settlement, except in cases where the arrangement of conditions might be positively ensured. Mr. GLADSTONE had a year before encouraged the belief in his

eagerness for a treaty by introducing the expected reduction of the wine duties as an element of his Budget. The consequence has been that the French Minister has over-reached himself, and that the English Government has for the present declined to continue a discussion which could not be completed within the stipulated time. M. TIRARD asserts that he was prevented by statute from prolonging the term. There is no such prohibition in the Act, but the condition was stated both in his speech and in the *Exposé de Motifs* which, according to French practice, was prefixed to the Act. It is not the business of English critics to inquire whether the statement of reasons is a part or preamble of the Act. It is enough that the French Minister professed to be unable to prolong the negotiation.

It is not improbable that the negotiations may be resumed, as the short-sighted astuteness of the MINISTER of COMMERCE appears to be generally disapproved in France. The English Government took occasion in the QUEEN'S Speech to express its continued readiness to negotiate; but Lord GREY'S reasons for seizing the opportunity of withdrawing from an erroneous policy deserve full consideration. It is as true now as it was four-and-twenty years ago that duties ought to be imposed only for the sake of revenue, and to the amount which may be required for the purpose. It is highly inconvenient to confer on foreign countries a right of objecting to any financial measures which may be conducive to the national interests. If it were expedient to levy increased duties on wine or on silk, the English Government and the English House of Commons ought not to be prevented from exercising their discretion. Experience has fully confirmed the opinion that foreign nations would be encouraged in a restrictive policy by the admission that they were entitled to receive purchase money for a benefit conferred on themselves. Lord GREY, agreeing with the economists of his earlier days, ridicules the belief that any community can be impoverished by the excess of its imports above its exports. Gain consists in receiving and not in giving, though a price must undoubtedly be paid for foreign produce consumed in England. If no public revenue were needed, or if it were provided from some other source, it is certain that the entire abolition of Customs duties would be an unmixed advantage to the community. Any approximation to absolute freedom of importation ought to be regulated with exclusive regard to the welfare of the population. If Mr. CORDEN had held his hand in 1860, foreign countries might perhaps by this time have imitated the policy which, as they would have seen, was enriching England. It may still not be too late to try a sound and consistent policy.

#### THE INDIAN CENSUS.

THE Indian Census has set at rest all doubts as to the accuracy of previous estimates of the population. Including the protected States, the great dependency contains 252 millions of people, or 12 millions more than it contained in 1871. It seems to require, if not a more terrible, at least a more universal, experience of famine than India has yet had to check the natural exultation called forth by these figures. Pleasure in an increased population has probably come down to us from ages when to increase and multiply was the same thing as to subdue the earth, and it has all the strength which survivals usually have. Yet, when we recall all that has from time to time been said about the growing poverty of India, there is something strangely irrational in any such feeling. Unless Englishmen have been altogether misinformed, there are many millions in India who habitually live on the very smallest provision of necessary food and clothing on which it is possible to keep body and soul together. A hot climate is unfavourable to the creation of artificial wants in either of these respects, and the standard of comfort is indistinguishable from the minimum of bare subsistence. What is to happen if a population which has already come to this pass goes on growing? It is estimated that during the last thirty years ten millions of people have died from famine. But for more than half this period concerted action against famine was in its infancy, and the natural check to population which scarcity supplies had not ceased to operate. Now that the State has undertaken to keep the people alive, and is properly anxious to see that what it has undertaken is performed, the influence

of this check will be immeasurably lessened. India is to be insured against famine; and no doubt, so long as the provision of the necessary revenue is made a charge upon the taxation or the credit of the country, the insurance will be effectual. But the more effectual it is, the larger will be the population kept alive to beg and bring forth children. The provision against famine will in part, indeed, consist of those public works which increase the actual produce of the soil. But an unknown percentage of it will be in the nature of positive relief, and from this point of view every million added to the population will yield its quota—probably its disproportionate quota—of new claimants for State aid in every season of scarcity. One resource which is open to the natives of other countries is not open to those of India. Emigration is not popular, and is not likely to become popular. Even if it were, the burden of the difficulty would be only transferred, not removed. We have seen something in the United States and in Australia of the welcome which is accorded to Chinese immigrants by the white labourers already in possession of the field, and though an Indian immigration might not be open to all the objections which attach to a Chinese, the most serious objection of all would be as weighty in the one case as in the other. The moral level of the new-comers might be higher, and their industry might be less irritatingly conspicuous; but the fact that they were ready to work for lower wages than white men would be equally unmistakable, and, once established, would equally mark them out as the objects of white hostility. In democratic communities the voters, if they choose, can say that such and such labourers shall not be admitted into the country, and the fact that the immigrants were equally British subjects with those who shut them out would not make the slightest difference to the result. In South Africa, indeed, the supply of white labour is not likely to be large enough to make this objection formidable, but unless the races of India cling to life a great deal more closely than they have yet done they would probably submit to die of starvation in preference to living under the stimulating control of an Anglo-Dutch settler. Consequently, whether the population of India be or be not too large for the territory which has to support it, there is not much chance that any other territory will be forthcoming to share the burden.

Where there is no help for a thing, it is idle to spend time in lamenting it, and if the figures of the Census stood alone, nothing would be gained by thus insisting on the black side which they present. But there is a difference between absence of lamentation and the open expression of satisfaction over the magnificent results of English rule. It is because symptoms of this latter tendency have shown themselves in some English comments on the Indian Census that it seems expedient to insist on the gloomy possibilities which this Census contains. The discovery that the population of India is growing larger and larger may be of real use to us if we take it as a warning, and not merely as an agreeable testimony to our own good qualities as rulers. These new subjects have either to be kept alive or to be furnished with the means of keeping themselves alive. If we neglect the latter duty we shall not be able, without going back from our word, to neglect the former. Sir RICHARD TEMPLE declares that "vast culturable areas within India itself are seen inviting the plough." Whether this encouraging view of agricultural possibilities in India is nearer or further from the fact than the gloomy pictures of exhausted soils and hopeless sterility which have been drawn by authorities who are presumably equally competent to have an opinion on the subject, we will not undertake to say. If the increase of the population were a matter within our control, it would be of great importance to ascertain on which side the truth lies. But when the population is there, and will continue to be there in larger and larger numbers, the hopeful theory is the only theory which it can be worth while to pursue. If Sir RICHARD TEMPLE is right, the invitation he speaks of cannot be too heartily accepted. If he is wrong, we shall be no worse off for having acted as though he were right. Even if it should prove that these new "culturable areas" show themselves less friendly to the plough than he supposes, much may be done by better treatment of the areas already under cultivation. We say this in reference not merely to the crops already grown, but to the introduction of new crops. Whether the best native agriculture is so

inferior to English agriculture as has often been assumed may perhaps be doubted. What has been grown in India for centuries may perhaps turn out to be as well grown as the conditions of soil and climate and habits of life will permit. But there are other crops which have only been grown in India of late years, and others, again, which can scarcely yet be said to be grown there at all. In both these fields of agricultural enterprise there is certainly room for hopeful experiment. It has not yet been ascertained, for instance, how far the Indian cotton industry can be made to compete with that of America in the supply of the Lancashire market. Mr. CAIRD says that, while an acre of cotton land in Egypt yields 400 lbs. of cotton, an acre of cotton land in India yields only 70 lbs. More than this; while these 400 lbs. are worth 14*l*, the 70 lbs. are worth only 1*l*. Of course, this superiority is partly to be traced to the peculiar conditions of Egyptian tillage. In Egypt the cotton plant is kept constantly moist, because the means for doing this are ready to hand. In India cotton is not irrigated, and, before it can be irrigated, there must be a considerable outlay of capital. Still, though an Indian cotton field may not admit of being made equally productive with an Egyptian cotton field, and though, even if the production were equal, the cost would be greater, and consequently the profit less, it is probable that both production and profit would admit of being considerably increased. Tobacco-growing, again, which is a still newer industry, may prove to be more profitable than some of those which already have possession of the field; and, in the search for better uses to which to turn land already under cultivation, we may occasionally stumble upon uses to which land not yet cultivated may be turned. It is satisfactory to know that the Agricultural Department has already been revived; but the figures of the new Census ought to stimulate the Government of India into giving it greater prominence than it has yet received. It is hardly too much to say that it is the most promising, and ought to be made the most important, of the Government offices—the one upon which money should be most freely spent, and to which the best intelligence at the command of the authorities should be constantly directed. Of all the methods of keeping the people of India alive, the surest is an improved and extended agriculture; and no more than this need be said to prove the paramount value of the department which has this method in its charge.

#### THE BRITISH ASSOCIATION.

THE special character of this year's meeting of the British Association cast on the President a task of unusual difficulty. Fifty years ago the Association, developed in the first instance out of a local scientific society, held its original meeting at York. The city of York and the Yorkshire Philosophical Society have now welcomed the Association at its birthplace after half a century of successful and increasing activity. Sir John Lubbock was therefore expected to produce something different from the usual type of the President's address. As a rule, the eminent person who is chosen as President of the Association for its yearly meeting is free to dwell almost exclusively on his own special department. The mathematician may expatiate on the beauties of the fourth dimension, or the biologist on the progress of embryology. But this time the occasion demanded a less specialized and more comprehensive survey. Sir John Lubbock was found equal to the undertaking. His discourse was nothing less than a general account of the progress actually made by science since the British Association was founded for the purpose of advancing it. The labour of preparing such an account, even with all the knowledge and means of assistance which Sir John Lubbock would naturally have at his command, must have been immense; and his disposition of the materials entitles this address to an honourable place among its author's literary performances. The President succeeded in making his review of half a century's scientific work exact without being laboured, interesting without being superficial or extravagant, and concise without being dry. Beginning with his own subject of biology, Sir John gave a sketch of the rise and establishment of Darwinism, stopping to vindicate Mr. Darwin from the gross misunderstanding of the people who still "consider that according to his theory a sheep might turn into a cow, or a zebra into a horse." Let us hope that Sir John Lubbock is, or shortly may be, wrong in counting such people by thousands. From the general doctrine of heredity and the development of species the address passed on to the course of recent special investigations in natural history, the discovery of alternate generations among insects, the fertilization of flowers, and the production of their scent and colours through the preferences of the insects which fertilize them, the germ theory of putrefaction, and the application of that theory to practical surgery, for which the Germans have already coined, after its inventor, the name of

Listerism. The further results which may be expected from Pasteur's latest experiments on protective inoculation were just glanced at. The results of modern anthropology were then passed in review, and the existence of pre-historic man in regions which, now temperate in their climate, have been alternately tropical and glacial since man's first appearance, called for a brief digression into physical astronomy for the explanation of these secular changes. One of the advantages of taking a review from time to time, however summary, of the advance of knowledge as a whole is that it forces on the attention the connexion and working alliance of even those branches of science which at first sight appear most remote. Fifty years ago it would have been difficult for the most acute astronomer or naturalist to see what the variable eccentricity of the earth's orbit could have to do with any tangible problem arising from definite evidences of past life upon the earth. The progress of geology and physical geography next came in for a due share of attention, and here, too, matter was not wanting. The formation and structure of lakes, volcanoes, glaciers, and coral islands have all exercised the thought of eminent men of science in the period covered by Sir John Lubbock's address. A monograph on coral islands assured Mr. Darwin's reputation among specialists long before he was known to the general public. On all these questions great advances have been made good, though many details remain open to discussion. Sir John proceeded to speak of astronomy, and of the new field of knowledge laid open by spectrum analysis. In this connexion Auguste Comte's rash and unscientific assertion, that we could never possibly know anything of the chemical composition or structure of the heavenly bodies, was held up, not for the first time, as a warning to dogmatizers. From the astronomical work of the spectroscope it was a natural transition to the researches of Helmholtz, Clerk Maxwell, and others, on light and colour. The extraordinary conceit put forward by one or two late critics, including Mr. Gladstone, that Homer was colour-blind, was referred to with more respect than it deserved. Something was said of the immense progress made in the theories of heat and electricity, and the impulses given to all branches of physics by the discovery of the conservation of energy. For the progress of mathematics and chemistry Sir John Lubbock relied on memoranda communicated to him by Mr. Spottiswoode and Dr. Frankland respectively. We need not say that he could not have put himself in better hands. He glided lightly over the dangerous ground of the Economic Section, using the occasion, however, to repeat the plea which he has elsewhere advanced more fully for giving a better chance to modern languages and science in the arrangements of our public schools.

After the proceedings had been thus worthily opened, the Sections set to work in their accustomed manner. In the mathematical department the papers read and discussed are inevitably dismissed by public reporters with the safe generality that they are of a highly technical character. But, inasmuch as it is now and then suggested that the Association has degenerated from a working into a talking body, it is as well to mention that Mr. Glaisher reported in this section the completion of an important set of numerical tables, a work of much time and heavy labour, by a Committee appointed five years ago. In the physical branch of this section the question of most general interest was the future of electricity as a means of conducting and applying mechanical power. This, indeed, is a question on which two or three important papers and addresses in different sections (we refer specially to those of Dr. Siemens and Sir William Armstrong, besides that which we are about to notice) converged from their special points of view. Sir William Thomson's address "On the Sources of Energy in Nature available to Man for the Production of Mechanical Effect," was calculated to dash the hopes of speculators in some directions, but held out promises at least as good as any that it discredited. Among the sources of terrestrial energy the tides alone are not ultimately derived from the sun's heat. At first sight the tides appear to be an inexhaustible store of power, and man's failure to use them an inexcusable waste. But, though tide-mills have been made, the difficulties of making them work advantageously are enormous. Sir William Thomson thinks that, under the most favourable circumstances, it would be almost as cheap to reclaim and cultivate the area of foreshore that would be occupied by the necessary works. Then we have, derived more or less directly from the heating work of the sun's rays, wind, fuel, and rain. Wind does much useful work on sailing-ships, and some on windmills; but windmills are (contrary to what the natural man might imagine) decidedly costly machines. Sir William Thomson thinks that if windmills could be made somewhat cheaper—but only on that condition—they might be taken into use to drive dynamo-electric machines for lighting purposes. Meanwhile, windmills may have their day again when coal reaches famine prices; but that is not an agreeable prospect. Then we have rain, either in the form of natural waterfalls, or, conceivably, collected in artificial tanks. The collection of rain water in tanks placed high enough to give a mechanically effective fall is, however, impracticable, as costing far too much in proportion to the power that could be obtained. As to the power of natural falls, it is good where it can be used. Hitherto it has been available only to people who lived close to the fall. But now electricity comes in, and may have a great part to play. As a direct source of power, in the voltaic battery for example, it is at a hopeless disadvantage. The process is, in itself, nothing like so wasteful, in the sense of dissipating energy without useful equivalent, as the working of a steam-engine, but the prime cost of the materials consumed far outweighs this theoretical benefit.

On the other hand, electro-magnetism furnishes the means of converting mechanical work into electricity, and electricity back into mechanical work, "with unlimitedly perfect economy"; and the modern improvements in electro-magnetic machines have made it possible to do this with practical efficiency, and through considerable distances. Hence Dr. Siemens's bold suggestion of treating Niagara as a fountain-head of work to be tapped for the benefit of the North American continent. Sir William Thomson has calculated out the conditions, and finds that the power of Niagara might be usefully applied over a radius of 300 miles from the Falls, covering Montreal, Boston, New York, and Philadelphia. He further pointed out that Faure's accumulator enables us to store and distribute electricity at the receiving end without danger or material waste. We are, therefore, authorized by Sir William Thomson to consider New York lighted by Niagara, and even machinery in New York driven by Niagara, as not only a scientific but a commercial possibility. Nothing was said in this address of the possibilities of doing useful work by the concentration of the sun's direct rays, a subject to which attention has been given by one or two French physicists of late years. Experiments made in the South of France and Algiers have, we believe, been fairly encouraging. But Sir William Thomson can hardly be expected, in the latitude and climate of Glasgow, to follow this line of research with any lively interest. Sir William Armstrong, meanwhile, was giving his opinion of the applications of electricity in the Mechanical Section. His judgment was that for heavy work the steam-engine, wasteful as it is, holds its own. In theory the best possible heat-engine can turn only one-fourth of the heat supplied into useful work. The best actual steam-engines utilize only one-tenth. Yet we can afford this waste, because coal costs us little in comparison with other sources of power, and the oxygen of the air, which we use to combine with it in burning and produce heat, costs nothing. In wondering why steam should be so much cheaper than electricity, and even cheaper than windmills, we are apt to forget this gratuitous oxygen. Sir William Armstrong thinks, however, that electricity has many applications to light work before it in the near future, including the driving of small carriages. An electric tricycle—if released from the burden of paying the same toll and being subject to the same restrictions as a traction engine—would be a real boon to many dwellers in country places. On the whole, it is safe to prophesy that when the Association holds its centenary meeting, electricity will have taken a much larger place in the familiar conveniences of life.

A special discourse was given by Professor Huxley on the rise and progress of palæontology, in which he dwelt on the strong reinforcement brought to the theory of organic evolution by the evidence of extinct forms. In the early days of the "Origin of Species" Mr. Darwin's opponents raised objections on the score of "missing links." Since that time, as Professor Huxley pointed out, missing link after missing link between species, between genera, nay, between separate kingdoms of the animal world, as they used to be reckoned, has been supplied by our improved knowledge of the geological record. Professor Huxley reaffirmed, in short, the position which he took up in a discourse at the Royal Institution last year—that if the doctrine of the variability of species had not existed, the advance of palæontology alone would have made it necessary to invent it. At this very meeting, we may add, Professor Marsh, of Harvard, described, in the department of Biology, certain fossil birds, from the Jurassic formation of Colorado, which had so many reptilian characters that it is hard to say that they had quite left off being reptiles. This connexion may shock the people who are fond of birds, and look on the reptiles with the eyes of that gardener who justified his suppression of an unoffending toad by the simple remark, "I'll larn 'ee to be a toad." But palæontology is inexorable; and, if it leads anybody to look more kindly on toads, so much the better.

The mention of missing links reminds us of Section F, named Economic Science and Statistics, which imparts to the proceedings of the British Association a tincture of the playfulness of a Social Science Congress. Mr. Grant Duff did his best to impart gravity to the section by an opening address of a sternly historical character, in which he threw his weight in favour of some better definition of the class of subjects to be discussed. The traditions of Section F and the energy of crotchet-mongers were, however, too much to be repressed; and a certain amount of serious economical discussion was swamped by miscellaneous holdings forth on temperance, free trade, registration of titles, and we know not what more. Finally, the British Association went to church in York Minster, and the Bishop of Manchester (so far as we can make out from meagre and partly discrepant reports) spoke with respect of Haeckel, though not altogether approving his opinions, a thing which certainly no bishop would or could have done when the Association held its first meeting in the same place.

#### THE ART OF POLITICAL CONSOLATION.

THE eccentricities of apology in which beaten parties are apt to indulge are not, perhaps, a very novel subject of study, but the interest of the study itself is perennial. Everybody knows the purpose with which speech was given to man by a beneficent Providence, and on this particular occasion—the occasion of a political defeat—it would seem as if reason itself might be reasonably described as having been bestowed to enable the reasoner to

conceal his thoughts, not from others, but from himself. The three English county elections which have been decided against the Government during the last few days have perhaps been somewhat more canvassed than most by-elections, probably because there is not at the moment very much else to occupy the canvassers; and accordingly there is an unusual opportunity for the student of the art of political consolation. Besides, the study has been of late much facilitated by the very useful and agreeable summaries of provincial opinion with which the *Pall Mall Gazette* provides its readers. It is possible, indeed probable, that we should never have had those summaries if Mr. Gladstone had not discovered the law of the inevitable inferiority of a central and metropolitan press, and in that case more good than usual has sprung from one of the Prime Minister's ingenious generalizations *ad hoc*. For it is a formidable task (though the conscientious politician used not unfrequently to perform it) to wade through piles of provincial newspapers; and, despite Mr. Gladstone, it cannot be said that the search was very often rewarded by the discovery of any pearls of great price.

The principal morning organ of the Government in London contented itself with making the most of Mr. Lowther's and Sir George Elliot's peccadilloes as to Free-trade and Coercion, and with remarking that it was "only Mr. Lowther"; which, considering that the late Irish Secretary is by common consent one of the most effective guerilla debaters of recent days, seems a little rash. More dangerous still for readers who have memories was the remark that even Mr. Lowther would not say that it was Liberalism which brought bad weather. Possibly Mr. Lowther would not; but it is not quite two years since every Liberal organ and every Liberal candidate, save a very few, were asserting in chorus that Lord Beaconsfield's Government had achieved this very feat. However, it is not everybody who has a memory, and there is always the celebrated Baxtorian excuse at hand, "Ah, yes, but I was in the right, and these fellows are in the wrong." The *Pall Mall* itself has been bolder. To begin with, it had fashioned for itself, with much deliberation beforehand, an ingenious theory of by-elections in general, which was ready for application when wanted. To explain, and indeed to understand, this theory is not easy; but it seems to come to this. If more voters vote for your own side than at the last election it is a victory, even if you are beaten, because the constituency is "more Liberal than before." If fewer voters vote on your side, it follows that there is a considerable number who would have voted on that side, only they didn't; therefore, in virtue of this considerable number, the constituency may be reckoned as yours. Conversely, if more voters vote for the enemy, these are deserters from your side, who may still be fairly borne on your muster-roll; and, if fewer, then it is quite clear that the enemy is virtually losing ground, though he may, by the fallacious operation of appearances, seem to be at the head of the poll. If these four principles are examined, it will at once become obvious that there is no possible state of things in which the best may not be hoped for the future. "If a certain number of voters could have been persuaded to poll as they did before," the election would have been ours. That this is undeniable everybody must see, and that it is comforting in the highest degree can only be denied by persons impervious to the force of reason. It is true that the art of political consolation seems sometimes to glide into another art—that which our rude forefathers called the art of political lying. It can hardly be considered wholly legitimate to comfort readers bewailing the fate of North Lincolnshire by remarking that the Lords "ran away" in the matter of the Land Bill, unless the running be taken in a Sheriffmuir sense, "we ran and they ran, and they ran and we ran," which usually happens in most compromises. However, this is a slight digression from the subject, warranted indeed by the example of our authorities.

It is probably old habit which has made us dwell so long on the unimportant utterances of an incapable metropolitan press. Let us turn to the real voice of the nation. The *Manchester Guardian* thinks that "the policy of the Government may have deprived it of a certain number of supporters." Now, as a general election which leaves a Government in a minority of a hundred does nothing more than deprive it of a certain number of supporters, the consolation here seems a little inadequate. The *Liverpool Daily Post* says that Mr. Lowther is "acting dishonestly," which is at any rate short, sharp, comprehensible, and perhaps comforting. The *York Herald* can think of nothing better than that sentence about the tail and the dog, which is perhaps a little stale by this time. The *Northern Echo* says that "the head and front of the anachronism"—a charming phrase which would lose half its charm if it possessed the slightest vestige of a meaning—is that Mr. Lowther is a wily prophet. The *Birmingham Post*, which at any rate deserves the credit of boldness, says that as Colonel Tomline was supported by Mr. Heneage, who had been a very weak supporter of Mr. Gladstone, the indignant electors of North Lincolnshire preferred to vote for Mr. Lowther, whose one political object may be presumed to be to overthrow Mr. Gladstone altogether. This assumes the existence of a great deal of political intelligence in the North Lincolnshire electors, and of not a little in the *Birmingham Post*. The same paper, in discussing the North Durham disaster, deduces from it that "nothing can stop the advancing and permanent triumph of the Liberal cause." The combination of permanent and advancing is perhaps questionable, as the *Birmingham Post* would discover if it offered an Irish farmer fixity of tenure at a "permanent and advancing" rent; but the language is perhaps good enough for the logic. The *Manchester Examiner* says that the Conservatives "have de-

cisely retrieved their position," but scouts the idea in the same breath of this retrieval being a Conservative victory. The *Liverpool Daily Post* is persuaded, by a course of reasoning which the extracts before us do not reveal, that "the country at large has more confidence in Mr. Gladstone than ever." The *Leeds Mercury* says it is all the fault of a leading Radical member and a leading Liberal newspaper; and the *York Herald*, which surely must be edited by the admirable Mr. Pott in his old age, says that the "delirious delight of Conservatives presents many points for study and amusement."

The odd thing in all these efforts at consolation—and it is needless to say that the oddity is not by any means confined to one political party—is the curious incapacity to distinguish between the frying-pan and the fire which marks almost all of them. For instance, let it be granted that Mr. Lowther won North Lincolnshire solely by protectionist heresy, and that Sir George Elliot won North Durham solely by truckling to Mr. Parnell—this last hypothesis, by the way, is arithmetically impossible, but no matter. The apologists we have quoted are more or less sure that this is the case, and they seem to find it consoling. That is to say, rather than admit that a certain number of electors in each case are dissatisfied with Mr. Gladstone's policy, and have ceased to be Liberals, they admit that they have become heretical on two points, one of which at least is vital to Liberalism, and both of which are vital to the policy of Mr. Gladstone. The distinction is remarkably nice, and it would be very interesting to see it worked out in detail by the *York Herald*, which, next to the *Shields Gazette*, for which we have looked in vain in the list of quotations, is on the whole our favourite organ. North Lincolnshire and North Durham are still devotedly attached in a general way to the present Prime Minister, only in a particular way they are irreconcilably discontented with him. Again, the fickleness of county voters is admitted with a sigh, but it is forgotten that if there was one thing which more than another gave the Liberal party what the *York Herald* calls delirious delight at the general election, it was the supposed development of firm Liberal principles in the counties. "After we have taken off your Malt-tax and given you a Ground Game Bill you turn against us," is a third reproachful cry. It does not seem to occur to the reproachers that the conduct of the farmers indicates not so much ingratitude for these benefits as a refusal to recognize them as benefits at all. But all this is exactly the way of the political consoler. He is eaten up with the zeal of finding some other reason for his defeat than the plain and straightforward one that his principles or the Government which embodies them are unpopular. If he can push that unpleasant conclusion back by a row of intermediate reasons sufficiently long to keep it out of sight he does not care whether the reasons lead up to it, after all, or whether they do not. Never mind this election and that election, the country was never more devoted to Mr. Gladstone. Of course the man who makes this practically idiotic statement knows that a score or two more of such evidences of the devotion of the country to Mr. Gladstone would put Mr. Gladstone in a minority; and, if the question were put to him categorically, he would no doubt answer it in the affirmative. But the object, for the present, is to lay a flattering unction to the sore place, and it is laid, regardless of logical consequences. Probably the thing does console some one; if it did not, it would not be persisted in; and, after all, it is thoroughly consonant with the general tendencies of human nature. The cricketer is never, in his own opinion at least, simply bowled by a ball that is too good for him; the whist-player never loses the odd trick by his opponents' better play. To admit this would be altogether derogatory to his dignity, just as it would be derogatory to the dignity of the "Bangay Herald" or the "Little Pedlington Gazette" to admit that their men have been beaten, and there's an end of it. It has been said that there is nothing to choose between the two political parties in this matter; but perhaps that is not quite the fact. If there is one characteristic of the party now in power exhibited most remarkably in its two great orators, and copied most accurately by the rank and file, it is a belief in its own infallibility. Ingenious apologetics are a natural result of that belief. It would be abhorrent to a true disciple of Mr. Gladstone or Mr. Bright to say: "We have made a horrible mess of the Transvaal, and a mess not much better of Ireland. It was a mistake to think the farmers such fools as to take the shifting of duty from malt to beer as equivalent to a remission of it, and it was a greater mistake still to hold out vague hopes when we came into office, which we knew we could not fulfil without making ourselves masters of the weather, and sinking America under the sea." The Government is still the best of all possible Governments, and its merits have only been obscured for a moment in the foggy East by lying dishonest wily Tories. In reply to this the outsider can only shrug his shoulders and wonder at the consoling effect of an hypothesis which seems to amount to this, that a section of the Liberal party, considerable enough to turn the scale, is gullible by the first loud promises, and can be made blind to the merits of the best of Governments by the first industrious person who takes the trouble to blind it.

#### WEIMAR.

WEIMAR, as Carlyle said of poetry, is "an attempt which man makes to render his existence harmonious." The place is small, the population and commerce are scanty, the wealth is inconsiderable, and yet within its narrow limits no cabinet

picture is more nicely composed or finished. Hereabouts lies a district of duchies—Darmstadt, Cassel, Meiningen, Gotha, Brunswick, Weimar; and the princes, not being much encumbered with serious affairs, have given themselves, after the habit of the small Italian States of a former day, to elegant trifles and dilettanteism. Some have indulged an innocent passion for collecting clocks, watches, planetariums, and porcelain; others, such as Weimar, have collected great men; while one, Saxe-Meiningen, has of late devoted itself to training a troop of players. None ever rode a hobby or carried out an idea with more thoroughness than Weimar; letters were revived through illustrious persons residing on the spot; "culture" became the end of life; nature was enhanced by art; great products of genius were nursed, though in the narrowest of cradles. The Weimar of the present is what geologists might call a "raised beach"; the ocean has receded, leaving a dry shore of shingle with scattered fragments of mammoth skeletons. But the encircling landscape renews spring by spring her youth; leafy paths and babbling brooks remain to the Weimar of to-day what they were to Goethe and Schiller.

The slumbrous, grass-grown streets of Weimar at every turn speak of the dead; the statues of Goethe, Schiller, Wieland, and Herder are in the public places, and in the Ducal Palace four rooms are decorated with frescoes illustrative of their works. Their houses are still kept up, and, with a poetic fitness, a local Shakespeare Society meets in Schiller's old abode. All travellers go to the prettily planted cemetery to see within the chapel crypt the tombs of Goethe, Schiller, and of the patron Duke, Karl August. Herder lies in the old Stadtkirche, and a tablet in the nave bears within the emblem of eternity the watchwords "Leben, Licht, Liebe." This church is also memorable by the possession of the chief art treasure of the town, "the Crucifixion," the masterpiece of Lucas Cranach, who here appears as the chronicler of the Reformation. The full-length, life-size portrait of Luther standing before the cross is "a master work of the first rank." The painter includes his own portrait; in the chancel lies his tombstone with full-length effigy, and in the principal square stands his dwelling; its handsome proportions tell that the arts in those days were not badly housed in Weimar.

The art collections in Weimar are choice rather than extensive. In the Duke's Palace, invaluable in the history of painting, are the original drawings in black and red chalk, by Leonardo da Vinci, of the heads of the Apostles in the Last Supper. The handling has an uncertainty and want of style which might indicate a copyist; but Dr. Ruland, whose authority is in high esteem in England, pronounces here on the spot in favour of their authenticity. He holds that existing defects are due to ill-usage in past times. These magnificent drawings, on the scale of the wall-painting, have certainly of late been in safe custody; formerly they were in the Ambrogian Library, Milan, and afterwards they passed through the collection of Sir Thomas Lawrence, so they come with fair credentials. It is cause for regret that permission has not yet been granted for taking full-size photographs of them; such studies ought to be seen in facsimile in every art library in Europe. Goethe with his wide-sweeping vision surveyed the career of Leonardo, and shows more than his accustomed knowledge in a review of the "Cenacolo," written at Weimar after his visit to the convent in Milan. The critic had scarcely sufficient technical skill to inspire the confidence of artists; but these heads in the Ducal Palace sustain his discriminating judgments. He points out how Leonardo reconciles individual character with generic form, and thus rises above the level of ordinary life. Within the little world of Weimar was fought out the battle of the schools; and Goethe, superior to considerations of mere consistency, in this essay as in other writings, is divided between realists and idealists.

The handsome Museum and Picture Gallery erected by the reigning Grand Duke conforms to the phases of æstheticism prevailing in Weimar. Scarcely a trace of the Gothic revival which has changed the face of other capitals is here found in the streets; and accordingly the sister arts, when seeking local habitation, selected as an architectural style one of the many versions of the Italian Renaissance which of late years has obtained currency throughout the German Empire. We can imagine Prince Bismarck to be afflicted with as strong a dislike of all symptoms of Gothic as the late Lord Palmerston. And as is the style of the Museum, so are its contents; they declare more positively than any other collection of equal size the epoch of the classic Renaissance which obtained supremacy in Germany towards the end of the last and the beginning of the present century. Foremost stand the wondrous designs of Carstens, who, guided by Winckelmann and inspired by Michael Angelo and Raffaele, and with a persistency only possible to a German, elaborated as slowly as surely these famous compositions from Dante and the stories of the Argonauts and the Centaurs. To understand Carstens, an artist who commands among his countrymen ever-increasing veneration, it is needful to visit Weimar. These drawings are about contemporaneous with Flaxman's designs, and were made, as a matter of course, in Rome. Carstens and Flaxman took their inspiration from the same originals. On the whole, the classic revival in England proved of more worth than that in Germany. Goethe, who in Italy had preceded Carstens by some ten years, was in complete mental concord with the artist, and became the means of securing for Weimar these pictorial expressions of poetic thought; while in Rome he was on the look-out for treasures, but his visits were too fugitive to bear much fruit. To the same school as Carstens, only less severely classic, belongs

Bonaventura Genelli. His somewhat romantic compositions in the Museum, wherein figure freely Satyrs, Centaurs, Bacchus, and Apollo, are conceived in the spirit of beauty, and come as the offspring of fancy and imagination. Genelli lived ten years or more in Weimar, where he died in 1868 at the age of seventy. Friedrich Preller survived just ten years later; the two friends lie in the cemetery which holds the ashes of the illustrious men of "Northern Athens." Among the more recent products of the Weimar School is the "Genelli Frieze," compositions after the style of Greek vases dedicated by Preller to his associates; the two artists were brothers in labour as in love. This pictorial narrative, after the fashion which obtains favour in modern Germany, depicts the life of the human race in the general, interspersed with the individual life of Genelli in the particular. Cupids, as might be expected, play conspicuous parts, and the draperies occasionally are scanty. Preller was the latest *genius loci*, a veritable product of the soil, and the Genelli Frieze now decorates the walls of his pretty villa in the chestnut avenue leading to the Ducal Belvedere.

The religious as well as the romantic phases of pictorial art in modern Germany also find a place in Weimar; indeed the two schools unite in a florid wall-picture in the Court Chapel by the local artist Professor Wislicenus, ex-director of the Düsseldorf Academy. Yet Christian art never held paramount sway, and the grand designs by Cornelius for the projected Campo Santo, Berlin, command a position within the Museum chiefly as creations of the imagination. The four Riders of the Apocalypse, here on a small scale, well known in replicas and reproductions, is accepted as one of the grandest and most original designs of our century; it breathes the spirit of the olden Teutonic days; but the drawing, when compared with Dürer's version of the Apocalyptic vision, shows the advance made by modern Germans on their forefathers, at least in the science of composition. Cornelius had little cause for gratitude towards Weimar, and the honour done to these ripe fruits of his old age serves as poetic justice to his memory. When a youth in Frankfort he sought fame and fortune by illustrating *Faust*, and his designs were brought by the friendly hand of Sulpiz Boisserée to Weimar, and handed with suitable prelude to the poet. Goethe did not find much to his liking; his inclination was towards the classic; and so he writes a cold patronizing letter which reveals the colour of the prevailing taste among reigning critics and princes. After a preliminary compliment to the pervading spirit of the olden time found within these designs to *Faust*, Goethe advises Cornelius to guard against the disadvantages of this line of study. His words read strangely by our present lights. "The German art of the sixteenth century," writes the Weimar oracle, "which lies at the basis of your work, cannot be accounted complete in itself, because it was but in process of development, and never attained the perfection of Italian art. Specially you must exercise your sense of the great and the beautiful by means of the most perfect examples of ancient and modern art." He then advises a pilgrimage to Rome, "where the creations of classic times and the works of the great painters will open to you a new world." Accordingly Cornelius, following in the footsteps of his critic, took the Italian journey, and in due course we hear of him at the house of Niebuhr on the Palatine Hill; a company of artists and friends are assembled and they read and discuss the "Dichtung und Wahrheit." Niebuhr did not hesitate to assert that the arch-critic "was utterly destitute of susceptibility to impressions from the fine arts"; and Cornelius broke into loud lamentations that Goethe should have taken a one-sided view of Italian art, that he should extol Palladio at the expense of the Gothic and the Middle Ages, while all joined in mourning over "the fatal Court life at Weimar where Samson had been shorn of his locks." Cornelius before quitting Frankfort had written a reply of characteristic independence to his censor; he expressed the hope that the time might come when in his own art he should attain the position held by Goethe in literature. The aspiration was realized when at length Cornelius won as his title "the Goethe of Painting."

The busts, portraits, and drawings in public and private collections make the illustrious dead living personages; the face of Dante is less often looked on in Italy than are the heads of Schiller and Goethe in Weimar. In the Museum is preserved the likeness of Goethe's mother, a woman of "mother wit," enthusiastic, we are told, yet shrewd and simple. One who made acquaintance with her features exclaimed, "Now do I understand how Goethe has become the man he is." Also of rare value in the literary history of the place are the drawings from the life of Goethe, Schiller, and Wieland. Very striking is the pencil sketch, made by the friendly hand of Preller, of Goethe after death, lying as a demigod with a laurel wreath round his brow. The original is in private hands. To the Museum belongs a drawing of equal import in a different way—Goethe, in picturesque costume, reclining at his ease among the ruins of the Roman Campagna. And almost of autobiographical interest are sundry sketches by the poet's own hand, which plainly tell how wise was his determination to abandon the profession of art for literature. Strangely enough, these painstaking pencillings have none of the dash and devilry pertaining to the passionate youth and to the "Sturm und Drang" period; neither in composition nor in the relation of the parts to the whole do they evince that sense of situation which might be anticipated in a dramatist. The scenes chosen are often local; sometimes they reproduce stirring incidents in which the poet was a sharer with his noble patron. Materials are lying at Weimar which would furnish a more complete life of Goethe than any yet written; Lewes's clever sketch would bear further details.

Weimar has of late years further added to her treasures by wall-pictures that mark an epoch in European art. "The *cyclos*" of sixteen compositions by Friedrich Preller, decorating the corridor of the new Museum, are connected with interesting personal incidents. The painter was picked up as a charity-school boy in Weimar, and his talents attracted Goethe, who prevailed on the Grand Duke to train up the lad as an artist, to provide him with a pension, and to equip him for Italy. The sage was at that time engaged on inquiries concerning colour and atmospheric phenomena, and he employed Preller to make studies of clouds and skies. The painter took the poet as the pattern whereon to shape his career; the doctrines propounded concerning nature, types in creation, the correspondence between mind and matter, and the relation of the subjective to the objective, Preller sought to develop through his art. And as in Weimar literature had taken a dramatic form, so did he strive as it were to dramatize nature, and to use a landscape picture as a stage whereon to enact the drama of humanity. Correspondent with the mental sphere in which he had been cast, the theme he elaborated was less historic or political than poetic. The prescribed mission of his life was to depict the wanderings of Odysseus; he followed in the footsteps of his hero; in the bay of Baia, in Capri, on the shores of Salerno, he made countless studies; in the Vatican he drew from the antique; and so he collected as his materials the most lovely forms in nature and the highest types in man. The great "*cyclos*" of wall-pictures painted in a wax medium resembling Mr. Gambier Parry's "spirit fresco" follows Homer's entire narrative, beginning with the return of Odysseus from Troy, and ending with the hero in Ithaca. The praise of these pictorial achievements rung throughout Germany; but Goethe had been dead forty years before this fruit of his teachings came.

The Theatre still enters largely into Weimar life; in front of the present structure stands Rietschel's marble group, Schiller and Goethe hand in hand, as in the days when under their conjoined management were produced *Egmont*, *Wallenstein's Lager*, *Maria Stuart*, and *Wilhelm Tell*. On special occasions all the resources of the stage are concentrated on *Faust*, including the Second Part, and people from neighbouring districts flock into the little town as to a festival. Open-air theatricals were formerly the rage, and in the grounds of the Belvedere there still remains a mimic theatre—the stage, orchestra and seats moulded in the green turf and backed up by trees. Also the sylvan retreat at Tiefurt was a favourite haunt of the Muses, and tradition to this day points to the spot where Schiller recited the *Bell* to an audience standing on the grass. Nature, too, has her share in recalling the past. It is nearly a century since Goethe, with the eye of an artist, planned and planted the Park—a cunning feat in landscape-gardening, an epitome of woodland beauties, with a river winding through the midst. It has been said that the life of a tree survives dynasties, and these noble and graceful growths outlive fleeting generations, as if to carry to completion the scheme of their planters. Goethe and Schiller in these cool sequestered shades found relief from the heated air of the Court; as poets and as thinkers they sought repose and loved simplicity. Still there stands almost untouched the rural Gartenhaus, a leafy cradle wherein was nursed nascent science; the garden seats are yet inscribed with verse; but the flower beds have degenerated into a wilderness of weeds—a strange homily on Goethe's hobby, "the metamorphosis of plants"! Weimar, little altered, would seem now as in former days to say to the outer world, Politics and business are but vanities—life is best realized through art.

#### LORD DERBY AT SOUTHPORT.

THE opening of the new Liverpool docks supplies an almost ironical commentary upon some of the lamentations we have lately heard about the decline of English trade. The Chairman of the Dock Board assured the Prince of Wales that the occasion of his visit far surpassed "in magnitude and importance any occasion of former times." The new docks, he said, add immensely to the area in which ships can be received, and still more to the power of receiving them. In addition to ordinary traders, they are capable of receiving those renowned lines of steamers which carry on communication between the Mersey and the ports of British America and the United States. This is hardly the speech of a man who thinks that the prosperity of Liverpool is a thing of the past. If these steamers are to go on running something like reciprocity in trade must still exist, whatever may be the case as regards duties. There must be a point at which a nation which has no longer the wherewithal to pay for what it buys must cease buying. No array of figures showing the excess of imports over exports can affect this certain fact. The increase in the imports may ultimately come to an end, and, if the power of exporting comes to an end, it certainly will do so. But, so long as it continues, the balance of trade will maintain itself somehow. No doubt Liverpool on Thursday was in a state to take a more than commonly cheerful view of everything. But after every deduction has been made for the presence of the Prince and Princess of Wales, and for the generally festive character of all the day's proceedings, the fact that the new docks have been built in times when the darkest predictions as to the course of English trade have been freely uttered and readily believed remains as a useful make-weight. Things may not be going as well as some of us could wish, but they must certainly be going a little better than some of us seem willing to allow.

The note of prosperity which—in spite of some appearances and mazy protestations to the contrary—these new Liverpool docks must be admitted to give, is repeated at Southport. It may be taken as certain that nearly 25,000*l.* would not have been laid out in building new markets if local opinion did not recognise a corresponding increase of trade in the recent past, or foresee it in the near future. No doubt Southport is a watering-place, and prosperous watering-places tell of pleasure rather than of business. But it is of pleasure which rests on and presupposes business. If Lancashire trade were as bad as is sometimes said, Lancashire traders would not have so much money to spend on the amusements of their wives and daughters. Southport has been more fortunate than Liverpool in finding a prophet ready to discern and interpret the signs of the times. Lord Derby made the opening of the market an occasion for a speech marked by much of the shrewd common sense which is usually claimed as his distinguishing characteristic. No place, however prosperous it may be for the moment, can “detach its destinies” from those of the country to which it belongs; and, before venturing to cheer the people of Southport with the near hope of better days, Lord Derby chose to inquire into the present and probable condition of England as a whole. Is there any solid ground for the despondency which is so generally expressed, if not so generally felt? Is English agriculture about to be destroyed by foreign competition, and English trade about to be ruined by foreign tariffs? Lord Derby does not think that either of these fears has very much foundation. As regards agriculture, he attributes the present depression entirely to bad seasons. Such a succession of them has not been known in our time. But, then, before our time there were seasons equally bad, which in time were followed by good seasons; and, as there is no reason to suppose that the English climate has permanently changed, the bad seasons from which the farmers have been suffering for the last four or five years will in their turn give place to good seasons. Lord Derby does not commit himself to any particular kind of crop. He does not say that wheat-growing or cattle-breeding will ever again be the business it has been. But he points to the growing population, and to the fact that the majority of this population live in towns; and upon these two data he builds the conclusion that the cultivator who has that insatiable market to supply can never be beaten out of the field by rivals 5,000 miles off. Englishmen eat other things besides meat and bread and things that do not easily bear transport from long distances. The demand thus created must be met somehow, and met by cultivators near at hand; and, with this necessity in view, land, in Lord Derby’s estimation, is as good an investment—the price being taken into account—as ever it has been before. As regards trade, Lord Derby holds that facts and figures combine to tell a similar story. To his mind the excess of imports over exports only proves that our foreign trade is exceedingly profitable, and that we have enormous sums invested in foreign countries. The tests he prefers to appeal to are the deposits in the savings banks—43,000,000*l.* in 1870, 78,000,000*l.* in 1880; the statistics of poor relief—1,079,000 paupers in 1870, 837,000 in 1880; the consumption of a popular luxury, such as tea—117,060,000 lbs. in 1870, 158,000,000 lbs. in 1880; Income-tax returns—445,000,000*l.* in 1870, 578,000,000*l.* in 1880; increasing population; high price of Government securities—in short, all the outward and visible signs of prosperity, coming when, according to many popular prophets, there is nothing but loss and eventual destruction awaiting us. In the face of these signs, “it is almost childish to despond and lament, because five years of exceptionally bad weather and disturbed trade have caused severe suffering to some classes.” The strong man not accustomed to illness is not easily persuaded that the petty ailment by which he is tormented and weakened will pass off and leave him as well as ever. This, according to Lord Derby, is the condition of England to-day.

It is most useful to have these encouraging views pressed upon our attention by so capable an advocate as Lord Derby, and with most of them we entirely agree. Indeed, Lord Derby’s figures afford irresistible proof that England has not yet begun seriously to decline in strength or prosperity. There is another side, however, to the picture which may supply a necessary modification in one or two of Lord Derby’s conclusions. The very circumstance that there was never a time when land was likely to be a better investment suggests that the prices which make the purchase of land so profitable cannot possibly have the same effect as regards its sale or its cultivation. The landlord who is willing to part with his land on easy terms has probably not found it possible to get his old rents, and the farmers who have refused to go on paying the old rents have probably not found it possible to do so and yet make a living out of their farms. This state of things represents a kind of distress which Lord Derby’s language seems scarcely adequate to describe. It may be a temporary distress as regards the community at large, but it is more than a temporary distress as regards some of the most valuable classes of the community. It seems quite possible that landowners and farmers may be in the position of the original shareholders in certain railways. If we take the present price of the stock, compare it with what it was twenty years ago, and note how steadily it has risen in the interval, we naturally congratulate the fortunate holders. But the good investments of twenty years back represent an equivalent number of bad investments dating from a still earlier period. The original shareholders lost their money, and those who saw the prices to which stock had fallen in consequence no doubt said, and said

quite truly, that there never was a time when railways were likely to be a better investment. The difference in the present case lies partly in the magnitude of the classes affected, and partly in the relation which their losses bear to their means. There were many railway shareholders; but what were they in comparison with the country gentry and the farmers? What was lost in railways was usually the savings made in the course of earning a livelihood; what is lost in land is usually the means of earning a livelihood as well. There is a little of what may be called the gross produce fallacy about this part of Lord Derby’s speech. Land in England may yield as large a profit in the future as it has ever yielded in the past, but if it yields it to a differently constituted society, the happiness of the community may possibly be less. At all events, it is not a matter for wonder that the particular classes who can see no place for them in the England of another generation should be tempted to take this gloomy view.

As regards trade, Lord Derby’s position is less assailable. The figures he gives do seem to show that, in spite of hostile tariffs, the advance has been great and continuous; and that, though the rate of progress is less rapid than it once was, it is, on the whole, progress still. The very magnitude of the interests affected by these tariffs is not unlikely to prove their salvation. France and the United States cannot afford to ruin their best customer. If they came anywhere near to it, we might fairly hope that their own trade would be so much injured in the process that they would have to change their fiscal policy from considerations of the purest selfishness. English trade had still more to suffer as regards America when the necessity of meeting the expenses of the Civil War sent the tariff to a point of which the wildest Protectionist had never dreamed. Yet there was not as much murmuring then as there is now—the reason, perhaps, being that then no hope was entertained of getting retaliatory or compensating duties imposed on this side, whereas at present a large number of persons are unduly sanguine upon this head.

#### FRENCH SLANG.

IT is natural that a guild, fraternity, or society should develop its own technical words and phrases, by means of which its members can converse with each other on business without being understood by *cowans* and intruders on their mysteries. When the *imperium in imperio* is a distinct nationality, like the Jews or gipsies, the native language is ready to hand for the purpose; and, becoming corrupted as the tribe assimilate themselves more and more with the people amongst whom they live, it degenerates into a mongrel dialect such as English Romany, Rothwulch, and other cryptic tongues. Such a means of intercommunication is obviously a necessity of existence to thieves and other extra-social orders, and their secret talk filters through by a very natural process into the conversation of the dissolute, though not exactly criminal, ranks of society. From these various elements a more general “slang” is gradually evolved, and, commending itself to the “gilded youth” whose notion of “seeing life” is confined to mixing with the dregs of the population, it rises in time to the surface, and words originally devised to cover some disgraceful thought or act are made part and parcel of the common parlance of the better classes. In no country is this more marked than in France, where even such purists and masters of the language as Théophile Gautier do not scruple to make use of *argot*. Concerning the derivation of this word philologists are at variance, but the most rational derivation seems to be from the old word *argue*, like *argutie*, “a quibble,” which has the same origin, and *parler argot* would seem to have been primarily equivalent to making use of some subtlety of speech. French Argot is a composite dialect containing seven distinct elements:—1. Old French or Provençal words; 2. Substituted expressions; 3. Arbitrary modifications of words; 4. Alliterative or onomatopoeic sounds; 5. Jeux de mots; 6. Reminiscences of history, politics, the drama, literature, &c.; and 7. Foreign words imported into the language. To the first class belong such words as *fiche*, now constantly in the mouth of every Parisian, and serving for almost every conceivable verbal expression. As early as the fourteenth century we find a *Maréchal de Boucicaut* forcing the Saracens to beat a retreat *et à se fiche dans des jardins*; later on he pursues them *et fiche en prison ceux qu’il attrappe*, just as a modern gendarme *fiche son homme au violon*—the latter word meaning the police station. The substituted expressions are either arbitrary or represent some function, quality, or aspect of the original word, such as “ticker” in English for “a watch,” and *tuyau de poêle*, like the American “stove-pipe,” as French slang for a hat. The modified words are still more arbitrary, such as *connobrer* for *connaître*, *icigo* for *ici* and the like. Of the imitative sounds *frou frou* for the rustling of silk is a sufficiently well-known example. The *jeux de mots* are sometimes very recondite in character; for instance, in the middle ages *maille* was the name of a coin and the *haubert* was a coat of mail; from this comes the modern word *aubert* in the sense of money. Another curious word for money in Argot is *brisie*, “embers”—that is, “the thing which makes the pot boil.” In English slang “coals” is used in exactly the same sense and the Romanians have translated it into *vongar*, with the identical meaning. Amongst these plays on words may be reckoned anagrams and “back-slang,” such as *linapri*, “prince,” and *arsouille* (for *souillart*), “blackguard,” also a mediæval word. To the “reminiscences” belong such names as Tartuffe, l’*échinelle*, and epithets like Gambettiste, Badinguiste, and so on.

the *propos* of the last expression, it will be remembered that Badinguet was the name of the mason disguised in whose clothes Napoleon III. escaped from the prison of Ham, and stuck to him as a nick-name ever after. During the Italian campaign the Emperor called up a soldier who had distinguished himself for bravery in a certain engagement, and, fastening the cross of the Legion of Honour to his breast, asked him his name. The man hesitated, looked foolish, and at length flatly refused to tell it; but on being commanded to speak out, and asked the reason for his reticence, he naïvely remarked, "Moi aussi, je m'appelle Badinguet." The foreign words in French slang are very numerous, and English has contributed a large share, "dandy," "handicap," "jockey," and the like, being quite familiar to the frequenter of the Boulevards. One would at first sight be inclined to derive the French *chic* from the English "cheek"; but it appears that the English is itself the derived word, *chic* being an old Romance word signifying *finesse* or subtlety, and forming the root of our own word *chicanery*.

Argot is, as might be expected, peculiarly rich in idioms for expressing the various stages of alcoholism. Thus, at the outset one is said *être bien*, *avoir sa pointe*, *être monté*, *en train*, *poussé*, *parti*, *lancé*, or *en patrouille*. A little later the patient is *légèrement ému*; presently he becomes *attendri*, a condition which is presently followed by that state of self-contemplation which Hans Breitmann has so beautifully expressed in his meditation upon a rocky Æolian harp:—

Und so mit dis toxigation  
Which hardens de outer Me;  
Ueber stein und schwein, de weine  
Still harps out a melodic.  
Boot deeper de Ur-lied ruget  
Ober stein und wein und schweins,  
Dill it ended where all peginnet,  
Und alles wird ewig zu eins,  
In de dipsy, dreamless sloomper  
Which units de Nichts and Seyns.

In this philosophic stage it is said of the individual *il voit en dedans*. Arrived at this stage he is decidedly *émêché*, and may expect *mal aux cheveux* in the morning. A somewhat more sombre view of life is suggested by the number of words for assassination—*faire nuer*, *refroider*, *chouriner* or *souriner*, *capahuter*, and so on; while the synonyms for thieving and cheating are simply innumerable.

The Parisian Argot is widely extended in its range. The famous Vidocq, in his work *Les Voleurs*, says:—

La langue argotique semble aujourd'hui être arrivée à son apogée; elle n'est plus seulement celle des tavernes et des mauvais lieux, elle est aussi celle des théâtres; encore quelques pas, et l'entrée des salons lui sera permise.

This was in 1837; in 1842 Nestor Roqueplan showed that Vidocq's prediction was already fulfilled; and Balzac, who appreciated the liveliness and energy of the disreputable tongue, speaks as follows:—

Disons le, peut-être à l'étonnement de beaucoup de gens, il n'est pas de langue plus énergique, plus colorée que celle de ce monde. . . . L'argot va toujours, d'ailleurs! Il suit la civilisation, il la talonne, il s'enrichit d'expressions nouvelles à chaque nouvelle invention.

As far back as the time of the First Empire, Argot seems to have found its way into the drawing-rooms, as the following anecdote sufficiently proves. M. de Beaumont, who was then Chamberlain to Napoleon, announced one evening at a reception at the Tuileries, "Mme. la Maréchale Lefebvre!" The Emperor advanced courteously and said with marked emphasis, "*Bonjour, Madame la Duchesse de Dantick!*" On this the Duchess turned round to the too laconic official and said, "*Ah! ça te la coupe, cadet!*" which may be freely translated, "that's one for your nob, young chap!" But then the *habitudes* of the courts of the *Monapartes* were for the most part what Balzac calls *grognots*, "not up to much." Popular cries, often arising from a trifling incident, contribute a number of strange idioms to Parisian slang. Some years back a countrywoman was noticed bustling about a railway station in the capital, vainly seeking for her husband whom she had lost, and crying "Où est Lambert?" This tickled the fancy of the crowd; the words flew like lightning over Paris, and formed for years a good-humoured though somewhat idiotic form of "chaff." As great a popularity, though shorter-lived, was achieved by the admiring phrase of "Oh, c'to-tête!" ("Oh, what a head!"), with which a *gamin* greeted the turbaned head of the Sultan of Zanzibar as it was protruded from the window of the railway carriage on its owner's arrival in Paris. Among the popular French slang words for "head" we may notice the term "coco," given—like our own "nut"—on account of the similarity in shape between a cocoanut and a human skull:—

Mais, de ce franc picton de table  
Qui rend spirituel, aimable,  
Sans vous alourdir le coco,  
Je m'en fourre à gogo.—H. VALÈRE.

Another word is *binette*, though this perhaps refers rather to the physiognomy in general. In the *Dernier jour d'un condamné* we read:—"Vous demandez ma tête, monsieur le procureur du roi. . . . Je regarde votre binette et je comprends votre ambition." *Binette* was the name of a fashionable Court hairdresser in the time of "Le grand monarque." Another of these popular Paris sayings is "*et ta sœur?*" which is as insulting a remark to a Parisian as the apparently harmless remark *sala*, "brother-in-law," is to a Hindoo.

Simple expressions are sometimes made to bear a much greater amplitude of construction in Argot than in the common lan-

guage; thus *As-tu fini?* an abbreviation of *as-tu fini tes manières?* is used as an ironical hint that the interlocutor is only wasting his words in endeavouring to convince the speaker, as "Rires; cris; as-tu fini? . . . A la porte! . . . Asseyez-vous dessus!" The last idiom, which recalls our own expression "to sit upon," means to impose silence on any one:—

Asseyez-vous d'assus  
Et que ça finisse.  
Asseyez-vous d'assus  
Et n'en parlons plus.

It is curious to note how the same slang expressions occur in languages widely remote from each other; *ba sar i kasi nishatan*, "to sit on any one's head," is, for instance, an old Persian idiom for repression or punishment. The familiar action of coachmen to quiet a fallen horse may have something to do with this, although the incident recorded in the "Bab Ballads" can scarcely be common all over the world:—

Her parents incessantly thrashed her;  
On water and bread  
She was sparingly fed;  
And whenever her father he lashed her  
Her mother sat down on her head.

The vulgar English idiom, "Do you see any green in my eye?" has its exact counterpart in French, though the two peoples appear to have arrived at it independently. Monselet has the following passage:—"Et quand tu m'auras bien aimée, en serai-je plus avancée, je te prie? Regarde donc de quelle nuance est mon œil." One may also say simply *mon œil*; "Quand le démonstrateur expose la formation des bancs de charbon de terre, mon voisin s'écrie avec un atticisme parfait: *Oui, mon œil!*" This extract reminds us of the story of the undergraduate who, being asked in *vind voss* examination on the New Testament, "Who were the sisters of Bethany?" placed one forefinger beside his nose, and retorted, with a knowing wink, "Who was the father of Zebedee's children?" Indeed there is scarcely a locution that does not suggest some English parallel. Monselet's words, "En serai-je plus avancée?" for example, naturally call up an inimitable picture in *Punch* of a tenant's dinner, at which one of the "quality," addressing his next-door neighbour, remarks what delicious claret it is that they are drinking. "Yes," says the farmer, sententiously, "*but we don't seem to get no forrarder.*" As a test of national disposition Argot is scarcely inferior to the traditional ballad. Parisian slang especially is very characteristic of the people who make use of it; it is lively, witty, and energetic, often something more than *un peu risqué*, but always amusing. Apart from its philological interest, and the necessity for at least a slight acquaintance with it for understanding popular French literature, *la langue verte* will well repay investigation.

#### BREAKFAST.

THE first idea that occurs to an Englishman in connexion with eating is, of course, his dinner. This is a vast subject in itself, and one upon which alone whole volumes might be, and indeed have been, given to the world. But however vast the subject may be, and however conflicting the theories that have from time to time been advanced by the professors of the various schools of gastronomy, it will be found that the arena of discussion has of late years become somewhat narrowed, and that there is now a pretty general consensus of opinion as to what may or may not be safely indulged in at this supreme moment by an average mortal of the nineteenth century. Nor do modern habits admit of much divergence of opinion as to the time when the all-important meal should be enjoyed; for, to whatever extent we may rail at the increasing lateness of the dinner-hour, we do not, as a rule, exhibit any inclination to adopt the only means of remedying it—namely, an alteration in the hours of our daily vocations, whether in the way of business or pleasure. Luncheon is, in the eyes of a professed gastronomer, an ignoble meal, suited only to the capacities of ladies and children, and not deserving of the concentration of the higher powers of the mind, or the more profound resources of the culinary art. It is, moreover, to most men an uncertain and moveable feast, and many get on very well without any luncheon at all, or with the lightest possible form of refreshment, that can hardly be called a meal. It is, perhaps, just as well for themselves that this should be so, for when a man once takes seriously to three or four courses and "vintage wines" at luncheon, the chances are that it is all up with him, and that indigestion has marked him for his own. But breakfast in one form or another is an absolute necessity, and the first meal of the day may fairly claim to be considered, if not altogether equal, as at least only second in importance, to the crowning ceremony of dinner.

Important, however, as it undoubtedly is, there is no meal respecting which there is a greater diversity of opinion, or upon which it is more difficult to lay down any abstract rules that shall be generally acceptable. Hardly any two persons entirely agree in their views as to what is the most desirable form of breakfast; and if a searcher after the ideal were to follow all the advice open to him, the chances are that he would either never breakfast at all, or would rush into such extremes as would bring him and his breakfasting to an untimely end. A good deal of this uncertainty is doubtless due to the changes of modern civilization. In the days of our forefathers, breakfast was almost as solid, if not as pretentious, a meal as dinner;

and the modern trifler with his tea and toast reads with astonishment of the consumption as a matter of course of huge rounds of beef and tankards of ale at an hour when he is usually wrapped in slumbers from which it would be most painful to him to be aroused. It must, of course, be remembered that these heroes of the knife and fork were probably snug in bed and well into their first sleep at a time when a modern evening is only just beginning; and, after having risen in what we should call the small hours of the morning, they would naturally be not disinclined for some refreshment of a solid and sustaining nature as early as six or seven o'clock. There is something about these old-world repasts that is pleasantly suggestive of the rudest of health and of active outdoor exercise; and the mind is apt to dwell fondly and perhaps regretfully on the records of gastronomic feats that modern habits have rendered a thing of the past. For he would be indeed a bold man who should attempt to combine the daily routine of social life at the latter end of the nineteenth century with a breakfast of cold beef and ale; and should he survive even a very limited course of such treatment, he might congratulate himself on being the possessor of an iron constitution, and on being absolutely impervious to the attacks of indigestion. Degenerate as we are, however, we have not lost all traces of the good old-fashioned breakfasts of the middle ages, which still survive to a modified extent in many country houses throughout the kingdom. And what is generally known as a "country-house breakfast" is perhaps, after all, the pleasantest way of indulging in this necessary and much-debated meal that is still open to us. There are, in the first place, many of the surroundings that existed in the old days, in the form of fresh air, exercise, and fairly reasonable hours. A quiet country life is essentially conducive to good appetite and good digestion; and the overstrained man of business finds that a few nights' quiet sleep, with a complete rest from brain-work, will enable him to tackle his breakfast with a zest that is unknown to him in London. Given good health and a pleasant party, there is certainly something peculiarly cheerful and exhilarating about the breakfast hour on a fine morning in the country. The chances are that there is something going forward in the way of sport or other recreation which provides a topic of cheerful conversation to every one as he appears in turn. If it is summer, there is very likely a cricket match or lawn tennis party coming off, affording an ample field for friendly discussion and good-humoured "chaff." One gentleman, who is known to be no great hand at breakfast at any time, is entreated not to eat too much for fear of imperilling his chances of a long score; another is warned that it is likely to be a very hot day, and that he cannot be too careful of his complexion; while a third, who is notoriously addicted to the good things of this life, may find himself beset by a circle of importunate friends, who press upon him everything there is to eat on the table, exhorting him to keep himself up and fortify his system against the coming fatigues of the day. Nor is the occasion one to be missed by the ladies of the party, to whom the day's programme offers ample opportunities for the exhibition of their prettiest and most becoming dresses. It has long passed into a tradition that Englishwomen are the only members of their sex throughout the world who are able to stand the ordeal of early morning hours. What, indeed, can be more bewitching or more dangerous to the peace of mind of a susceptible bachelor than the first appearance of a fair English girl on a fine summer's morning, with all the accessories of a fresh and simple toilet, relieved, perhaps, by a dainty rose or a ribbon of the representative colours of the house or club, with the fortunes of which she is sure to identify herself during the day in the keenest and probably the most unreasonable manner? There is no time during the day when there are more opportunities for paying those little attentions which are so pleasant to all parties concerned. There are few houses where, after breakfast has got well under way, the servants are not banished from the room, whereby the attendance on the ladies devolves upon the gentlemen of the party; and, although ladies are not as a rule great breakfast-eaters, there will probably be ample opportunities for any one who is really anxious to display his devotion. In short, breakfast affords an excellent field for flirtation, and a great deal of quiet "business" can be effected at this early period of the day.

Nor do the changing seasons in any way diminish the social attractions of the country-house breakfast-table. It may be a question, indeed, whether there is not more real joviality about it in autumn or winter than in the balmy atmosphere of mid-summer. There is now something to be shot or hunted; and this alone is sufficient to impart a zest and a pleasurable bustle to the occasion which hardly any other form of amusement can supply. Apart from the actual importance of the particular sport on hand, the real or imaginary spice of danger attaching to it affords a further opening for the interchange of tender expressions, whether spoken or merely implied. A gentle entreaty to be careful with "that dreadful horse"—a sort of double-barrelled compliment, by the way, as implying not only that the person addressed is an object of attraction to his fair neighbours, but that he is about to bestride a quadruped requiring exceptional equestrian skill—or an anxiously expressed hope that the bold battue-shooter may not be brought home with a charge or two of shot distributed about his person, are very powerful weapons in the armoury of feminine allurements; especially when, as is often the case where hunting or shooting is the order of the day, an early and informal breakfast is instituted, ostensibly for men only, but from which it is understood that ladies, if they have any particular reason for

getting up early, are not to be altogether debarred. What can be more overpowering or more calculated to make a hesitating suitor cast all prudence and caution to the winds than to find that a fair damsel has got up at an unearthly hour on a cold winter's morning for the express purpose, as she is pretty sure to let him know by some means or other, of seeing him off or of ministering in some way to his comfort. Many a man's fate has been sealed in this way; and it would, indeed, require exceptional sternness of disposition not to be overcome by such a touching manifestation of regard.

All this will, however, be looked upon as sheer barbarism by the true philosopher and skilled breakfast-eater, who, as a rule, prefers, on the grounds both of health and comfort, to take his morning meal in the strictest solitude, and who would consider the surroundings of such a breakfast-table as we have referred to calculated to upset his organization for the rest of the day. As he sips his carefully-prepared cup of cocoa, or loiters over his morsel of fish or other light and easily-digested adjunct of a repast which would have been looked upon by his great-grandfather as only suitable for an invalid, he will probably shudder at the idea of a noisy party at such an hour in the morning, and congratulate himself on having sufficient judgment and strength of mind to keep aloof from such preposterous orgies. There can be no doubt that his view of the case, though perhaps somewhat unsocial, is by no means without justification. It is impossible to deny that a solitary breakfast has advantages which to many may seem altogether to outweigh the frivolous attractions of a gregarious meal. For to enjoy the latter thoroughly, it is in the first place necessary to be in the possession of good health and a fair amount of animal spirits; and there are few of us who do not occasionally get up in the morning with a disposition to shun our fellow-creatures, and a longing to be left in peace until the day shall be a little older and we feel strong enough to battle with what it may bring forth. There are some, moreover, who may be inclined to shrink from the enforced publicity of the social breakfast-table in the matter of their morning letters, which in many country houses, especially those where old-established customs are rigidly maintained, are timed to appear when breakfast is about half over and conversation is perhaps beginning to flag. There is doubtless much that is impressive about the entry of the confidential upper servant with the post-bag, and the solemn unlocking thereof by the master of the house; and the subsequent distribution of its contents is probably to many the most exciting moment of the day. But, should it happen that your letters contain bad news, or even such intelligence only as requires your immediate and undivided attention, the laughter and chatter going on around you will sound all of a sudden strangely discordant, and your only object will be to escape as quickly as possible to the solitude of your own room. Or you may have your own reasons for not wishing that a certain handwriting or a certain monogram should be observed by that charming lady by your side, who nevertheless will have seen it, and formed her own conclusions on the subject, before you have had time to take possession of the letter; and you feel, as you open it with a feigned indifference, that all hope of secrecy on that subject at any rate is at an end. If by any chance there is no letter for you at all, you are conscious of being an object of somewhat contemptuous pity, not only to the trusty domestic who passes you without thrusting his salver under your nose, but to the company in general; and your sentiments, which under the influence of a good breakfast and pleasant society, were beginning to expand into general philanthropy and a disposition thoroughly to enjoy yourself, are changed into envy, hatred, malice, and a general feeling of bitterness and discontent. All this is happily avoided in those well-ordered establishments where the post comes in quite early in the morning, and where you can have your letters brought up to your room before coming down to breakfast. But even then you may be called upon to face a mixed company and to join in conversation or laughter for which the perusal of your letters or the state of your health has rendered you singularly indisposed; and you may find yourself wishing that every British subject was compelled by legislative enactment to breakfast alone. On such occasions, indeed, you may be tempted to contrast your present position somewhat unfavourably with the freedom and independence of a bachelor's life in chambers or lodgings, and to register a vow, to be religiously observed until some unusually pleasant invitation causes you to throw your good resolutions on one side, that you will henceforward eschew country-house parties and live the life of a recluse. For it need hardly be observed that, in order thoroughly to enjoy the advantages arising from a solitary breakfast, it is necessary either to be a bachelor or to have acquired a state of independence that is vouchsafed to few married men.

It would seem hardly fitting to quit this subject without some reference to a particular form of breakfast which, although now happily gone out of fashion, will be remembered by many still living, and which indeed appears to have been much in vogue among an otherwise intelligent and sensible class of men up to within the last thirty or forty years. We refer to those matutinal gatherings of which we read in biographies and memoirs, convoked at the house of some leading luminary in the literary or political world, which, commencing at the normal breakfast-hour, were prolonged far into the day. We are usually given to understand that on these occasions the flow of wit and anecdote was brilliant and unceasing, though it must have been rather trying to be expected to be brilliant or amusing so early in the morning. Anything more hopelessly uncomfortable or more entirely out-

posed to all accepted theories as to what is conducive to health and digestion it would be difficult to imagine. Of all modern social inflictions to be avoided on the score of general discomfort, an average wedding-breakfast is about the worst. But these convivial or literary breakfasts must have been even more trying in some respects; for, as a wedding-breakfast does not usually take place till at least the middle of the day, there is generally the possibility of getting through a certain amount of the day's business beforehand. But if you are invited to breakfast at nine or ten o'clock, and sit over it till about the modern hour for luncheon or even later, the chances are that by this time you will be hopelessly demoralized, and that the rest of the day will, for all practical purposes, be gone. In these days, in fact, such a thing would be out of the question, for no one except the veriest idler could afford the time for such an entertainment; and to ask a party of friends to breakfast with you, unless for some very special purpose, would be regarded as a somewhat questionable form of hospitality. The practice undoubtedly survives to a certain extent in such comparatively old-world retreats as the Universities, where not only is the greater part of the morning often taken up by a meal that, for the solidity of its component parts, would not have done discredit to the ancestors of the party, but where it is the fashion to indulge in such strange mixtures both of solids and fluids as would have tried the digestive powers of a fox-hunting squire of the seventeenth century, and would in all probability be fatal to any stomach but that of an undergraduate. But, as a feature of general society, the breakfast party is a thing of the past; and in the interests of our health and our digestions it is to be hoped that it will never again come into fashion.

#### METUALI FARMERS.

PERSONS who have not visited the least-known parts of the Lebanon chain can form no idea of the pleasant life of its mountain-farmers. It is a pastoral existence combining the attractions of Northern Italy with a finer climate than that of the Venetian Alps, with greater freedom, and with the traditional charm of the East. Here, and here only, can we see the Arab mares with their foals roaming free on the hillsides, the flocks of goats following the tune of the pipe, the oxen treading out the corn, and the full grapes pressed into the cup. Here the trickle of a water sweeter than wine springing ice-cold from the rock, and the cries of the kites borne up from the valleys on a breeze fresh with the scent of pine-woods and of the sea, are the only sounds that break in on a lazy mid-day silence unknown to cities. In the distance the snow-topped peaks of Ain Etla and Jebel Sunneen form a fine background for a picture that changes with every curve of the mule-paths—a picture of no very striking beauty perhaps, but still one that has its own unique fascination. Nowhere else can industry and desolation be seen at such perpetual strife; every inch of the higher ground has to be disputed with the stubborn blue rock, and a Norfolk farmer would be ashamed of his annual grumbling were he to see the land which, taking the good with the bad, can give from ten to thirty per cent. on outlay. The comparative poverty of the earth is, however, compensated for by the magnificent climate, and soil which would be worth little elsewhere yields double and treble crops on the Syrian slopes. The mulberry trees stripped in early spring give a second leaf harvest in autumn, and the Franjeeyeh grape may be said to bear for two-thirds of the year, showing new leaves, buds, unripe fruit, and matured clusters on the same vine. The hollows which have caught the rains, and the strip on either side of the smaller streams, may be sowed and reaped twice between February and November with almost any cereal. The most usual products are wheat and barley, which will grow with little care, and are sure to command remunerative prices, besides supplying the wants of the grower; but we have seen capital heads of maize lining the watercourses in sheltered divides, and tobacco will often flourish freely even on the high grounds.

The race of cultivators who enjoy these natural advantages are frugal almost to a fault. Men worth a couple of million of piastres will dress and live in a style below that of an English ploughboy. Although imbued with a certain traditional sense of honour on some points, they are almost without that pride in their belongings which should distinguish their social status. Abundance to eat and drink, and freedom from oppression, constitute the *summum bonum* of their existence. True, they have a sturdy independence which is pitifully conspicuous by its rarity throughout the Ottoman Empire, but this is not the healthy sort of pride one would like to see among them. It is merely a result of their immunity from the grinding of the supreme Government, for, with the exception of some of the outlying districts, most of the mountain-farms are beyond the jurisdiction of the Vilayet, and exempt from its taxation and tyranny. The difference between properties where the foot of the Effendi does not forbid the grass to grow, and those where he claims a seigneurial right, is most striking. The threshing-floors of the former are scenes of festive gatherings, where each man winnows out his corn and carries home his full measures untroubled by officials. At the haydars of the latter the revenue officers, in costumes that have seen better days, with pen and ink, sieve and shovel, set apart the Sultan's tenth, and stamp his heaps with the ponderous wooden seal, leaving the hated "Vilayah Souria" to warn off peculating fingers. We need hardly add that the rightful taxes are the smallest burden these villages have to bear.

We are speaking now, however, of the true Lebanon farmer, and we will take for illustration the natives of a small village in the Kessrouan, which shall be nameless, and which will suit our purpose as well as another. Most of its inhabitants are Metualis, the only Christian tenant being an ancient Maronite miller. His co-religionists who once dwelt there have been slowly ousted from the field by their neighbours, who are better farmers, and who, when once they acquire a working majority in a district, soon get it all to themselves. Besides pastoral and agricultural pursuits, few or no industries appear to exist amongst the Metuali. Every man is his own mason, carpenter, joiner, and tailor. The houses are very roughly thrown together, built of limestone hewn out of the ground, if not picked off its surface, each piece being piled on as it happens best to fit into the angles left by its predecessors. Inside, the walls are plastered with a composition of mud, lime, and straw, and the door generally boasts a couple of supporting posts, on the tops of which the largest stone in the building is laid crosswise. The windows are merely left out in the course of construction, and in their place are a few pieces of plank nailed together with the idea of fostering a delusion that the weather can be kept out at night. The dwellings of rich and poor differ but slightly, only that the former will perhaps have frescoed figures daubed on the wall in red and blue paint, and a trestle or two, on which a mattress makes apology for a divan. As a rule they are all cleanly to look at, though experience will possibly force the traveller of to-day to complain, like his first forerunners, "de la grande planté de mouches, et de puces grans et grosses qui estoient dans l'ost." Household utensils are few and primitive. The *batterie de cuisine* is inexpensive, consisting in four bricks and a dozen iron spits, with perhaps a universal saucepan. A flea-brush made of the twigs of a sticky plant stands facing a red jar, containing the day's water supply, in the opposite corner, and the furniture is complete. For visitors a table of a foot high may be produced and a mat unrolled, but such a display is extraordinary, and chairs do not enter into the compass of imagination at any time. For out-of-door work all implements that will admit of it are made of wood most deftly fashioned. In dress the Metuali are as modest as in their other surroundings. That of the women is simple, and does not give much scope to vanity. It consists in a bodice cut very low and very narrow in front and drawn in tight to the figure at the waist, while a skirt, generally of the same piece, covers a pair of ample trousers. Their head-dress is merely a coloured kerchief tied over and under the two plaits of hair which are allowed to hang down the back; and some wear curls on either side of the temples in imitation of the Bedouin girls. An amber or glass-bead necklace, a brass ring, and a bracelet or two of debased silver, are the usual ornaments. Earrings are not very commonly to be seen. The costume of the men is more picturesque than that of their wives and sisters, and the grace with which these sons of the mountain carry themselves even in rags and tatters is surprising. No painter or sculptor need seek a finer model than a Metuali shepherd springing from rock to rock, and stopping now and again with upraised arm to recall his flock to their duty by voice and sure-aimed stones. They almost all dress alike in loose blue pantaloons tucked into huge knee-boots made of half-tanned leather, and always used as protection against snakes. A variegated waistcoat will sometimes cover a shirt, and oftener do duty for one; while over all is the black-striped *abbas*, a heavy blanket-cloak, of no particular shape, which serves equally to guard against the heat and the cold. The head is protected by the becoming *kefia*, which is a square scarf made of silk or cotton, and bound over the forehead by a double coil of thick woollen rope dyed black, and sometimes as large as an inch in diameter. This coiffure, which will make an ugly man look well, is admirably adapted to set off the bronzed beauty of the mountaineers, who are, however, utterly indifferent to its ornamental virtues as compared to its comfort by day or night. The outfit is completed by the belt of many colours, holding the *galion*, or pipe, and the indispensable knife, with the addition sometimes of a pistol and brass shield-shaped cases for powder and shot.

It is easily to be supposed that a life so rude as theirs leaves little time to the Metuali for the cultivation of the higher accomplishments. Not one in fifty of them can read or write, and a sharpened memory is the only account-book they can keep. To such a pitch is this faculty heightened in some instances as to be little short of marvellous. We remember the steward of a large estate who rendered his complicated accounts weakly without notes of any sort, and it was avowed that he could recapitulate the items of any villager's debit and credit, together with the expenditure of his master's establishment, for the last ten years. They are quite aware of their want of mental training, and are ready to express shame when reminded of it; but they will always excuse themselves on the plea of no need existing to stimulate them towards bettering their education. Their amusements consist in the most primitive dancing and singing. The chant of the women is inferior in point of art even to that of the Ghawazeyeh, but it is far sweeter, as they do not aim at the metallic nasal twang so much prized in Egypt. When singing in chorus, they trill a refrain to each verse very much in the style of a Swiss jodel, which has a pleasing effect, especially at night, when the facial exertions are not apparent. Their dance is of quite a rudimentary kind, and has neither grace nor quaintness to recommend it. Although, as a rule, no woman is allowed to dance in the presence even of her own husband, or indeed of any near male relative, the rule is not

strictly observed, and we have seen man and wife perform their antics in company, notwithstanding, too, that he was a priest of his sect. The usual dance of the men is more grotesquely feeble than that of the women, and half a dozen mountaineers joining hands and stamping round a circle to the accompaniment of clapped hands is a ludicrous spectacle to be compared to nothing but the gambols of tame bears, as we are accustomed to see them swaying to the flute of the Savoyard. The enjoyment they themselves derive from the exercise is nevertheless unbounded, and in ten minutes they will work themselves up to a frenzy resembling that of the Dervishes. Occasionally such a performance possesses an attraction in the person of a skilled piper, whose music is really good, when the listener, like Evelyn on hearing the Marseilles galley-slaves, will be astonished how he plays "both loud and soft music very rarely." Another amusement, which is at the same time an occupation, is the chase. Some of the farmers grow so fond of sport as entirely to neglect Ceres for Diana, and the grain ripens and falls ungarnished while the sportsman is skulking after partridges, or lying in wait for larger game in the forests. Here wolves and bears are to be found, but they are seldom killed, owing to the poor quality of the weapons and the toughness of the quarry. Not long ago a bear-hunt was successfully terminated after two days' hard work, and at the cost of a man's life, when the animal's skin was found to contain fifteen bullets—a result which would scarcely encourage future meddling with the destroyers of the maize crops. Most of the guns are single-barrelled, of prodigious length and of antique build, but, notwithstanding their clumsiness and flint locks, a good shot rarely misses his aim with them. Like all other matters of Eastern life, the departure for the chase has its special formalities, and the distinction between the valediction addressed to a sportsman of repute and that to a novice must be strictly observed. The greatest insult that could be offered to the former would be to dismiss him with the words *Neshoofuk*, or "We shall see what you can do," it being well-known that he never returns empty-handed; and, on the contrary, by saying, *Awanyduk*, or "according to your custom," to a mediocre gun we pay him the most delicate flattery imaginable. These small set modes of expression are innumerable, and make one of the greatest difficulties in the way of a foreigner's acquitting himself politely in Arab company. At the same time it must be extremely convenient to a people of limited ideas to have speech and answer apportioned out for every occurrence of daily life.

Turning for a moment to the social relations of the Metuali, we remark that they are marred as usual by religious crotchets, though not to so great a degree as in the case of genuine Mohametan of the true Shiite sect. The women are treated more as companions to the men than as toys or slaves, and, except at harvest-time, when they work hard in the fields, they busy themselves actively with domestic cares and with the housing of cattle and tending of poultry. Though the law does not hold the Metuali to monogamy, whether by poverty or by inclination he usually restricts himself to one wife. She, in return, is generally very fond of him, and is perhaps a better wife than mother, which is not often the case under the Koranic dispensation. Many couples come together originally in virtue of the curious custom of the *Metn*, or law of possession, by which a father gives up his daughter for a term of years on payment of a sum fixed by written contract. At the expiration of the time the girl is returned, and, if her temporary owner has not been pleased with her, she is again in the market, either to re-enter into *Metn* or to be married. No stain whatever attaches to her. We know of a case in which a man paid off a heavy mortgage by means of his three daughters, marrying them all well finally. Consequently, a Metuali father will mostly be better pleased to see himself blessed with handsome girls than with stalwart boys—another anomaly in the East. The results of this system, strangely enough, do not seem to be so prejudicial as might be supposed to the primitive society in which it is carried on; for it naturally happens, in the majority of cases, when a woman has borne children to a man which he must support, that he is not willing to repudiate her, but prefers to keep the mother with the family, and so the *Metn* becomes the preliminary to marriage.

Though we do not wish to enter into the wide question of land tenure in Syria, we may perhaps say a word as to the conditions on which the tenant-farmers of the Kessrouan hold and cultivate their land. Most of them are little more than badly-paid labourers under a large proprietor, whose principle is as follows. The tenant is put in possession of a house and a few acres, for which he pays a fixed rental to the owner, and from which he has to make the best profit he can. This is generally small, and in bad years an ugly deficit makes recourse to the usurer a necessity. The nearest money-lender is of course the proprietor, who advances sums sufficient for the working of his own farms at a remunerative interest, taking meanwhile the prospective crops as surety. He thus receives at once the rent of his farm, a high interest for capital, and the whole of the produce, leaving the farmer perhaps still in debt. The system seems infamous at a first glance, but it is not so utterly bad as it appears if the proprietor is tolerably just. Some there are whose aim is merely to extort as much money as possible, and under such men the life of the poor is little better than slavery; but the majority content themselves with getting quick and large returns for their expenditure, without pressing too much on the peasantry. We then see the agriculturist living from hand to mouth, it is true, but in comparative ease and comfort, and the proprietor netting from fifteen to twenty per cent. on his capital. Such a rate may astonish Western speculators, but it is a common one in Syria, and a

short while ago the writer was offered twenty-five per cent. on undeniable security. Those who practise extortion, and have "their backs in a niche," as the Turks say of people enjoying protection in high quarters, frequently get forty and fifty per cent. without any risk. If the season is bad the owner's pocket does not suffer so much as the tenants' mouths, and we regret to say, in many instances, their backs also. All things considered, we cannot wonder at the objectless existence led by the sons of the soil; we can only pity them, and admire the spirit and gaiety which centuries of oppression have not been able to kill.

#### THE MONEY MARKET.

THE money market just now presents an interesting subject of study. A month ago the Bank rate of discount was as low as 2½ per cent., while in the open market the rate was no more than 1½ per cent. On August 18 the Bank rate was raised to 3 per cent., and a week later to 4, while the open market rate for a time closely followed the Bank rate. This week, however, the open market has been less firm, and the rate has fallen to 3½ per cent. Still within a month the Bank rate has risen 60 per cent., and the open market rate has more than doubled. But for all that, money for very short periods, as a day, a few days, or a week, can hardly be lent at all. In the short loan market of London such a contrast between the rate of discount and the demand for loans is not uncommon, and it points to a very general expectation, or, at least, apprehension, that money is about to become scarce and dear. When such an apprehension arises, all who think that they will need money make haste to supply themselves by the discount of bills, add as they do this only as a precaution, they naturally desire to place the money out at interest until they shall want to make use of it themselves. A number of people over-supplied for the moment, and eager to earn something by lending out money, yet unwilling to part with it for any length of time, necessarily reduce the rate of interest, and create an impression that there is a plethora of loanable capital. In the present instance the cause of the apprehension which has brought about the state of things on which we are commenting is not to be found at home. If the market were under the influence of domestic causes only, the Bank rate need not have been raised. The genuine demand for banking accommodation is no greater than it was a month ago. The improvement in trade, which began exactly two years ago, has not yet reached the stage at which it would affect the value of money. It undoubtedly continues, as is proved by the Board of Trade Returns issued on Wednesday, which not only show that the exports this year exceed those of the corresponding period of last year—as they, in turn, exceeded those of 1879—but, what is more significant, the excess last month was greater than for any previous month, demonstrating that the improvement is gaining momentum. And the evidence of these figures is supported by the railway traffic returns, and, indeed, by all available statistics. But, although the improvement continues, it is not yet marked enough to raise prices and wages. And, until these are raised, improvement in trade does not affect the value of money. Nor does it seem probable now that we shall witness this autumn a more decided improvement. Had the harvest turned out as good as at one time it promised to be, it is likely that trade would have received a great impetus; for the farmers, though not recouped the losses of previous years, would have regained courage, and their ability to spend more would have reacted on all classes. But the rains of August have rendered inevitable a continuance of the agricultural distress. A more decided improvement in trade is therefore not likely, unless, indeed, it should be brought about by increased purchasing from abroad. Dearer money, therefore, from an increased trade demand is not to be looked for. And the rampant speculation of the early summer, which forced up Stock Exchange securities, and gave rise to eager bidding for loans, has died out. Thus, as we have said, the causes tending to enhance the value of money are not to be found at home. These causes are simply the bullion movements, generating a fear that we shall be left without a sufficient supply of gold to sustain our banking system.

There is a steady demand for gold for three separate countries—Italy, the Argentine Confederation, and the United States. The Italian demand is limited in amount, and not urgent, and therefore, if it stood alone, would produce little effect. It was originally for sixteen millions sterling, of which three or four have already been obtained, and, consequently, only about twelve millions are now required. Moreover, there are nearly two years allowed within which to provide them. The demand, being thus measurable, is not calculated to excite alarm. The demand for the Argentine Confederation, again, like that for Italy, is for the purpose of resuming specie payments. But it is much smaller than the Italian, and, therefore, still less calculated to disturb the market. It is the drain to New York which has so suddenly and strikingly enhanced the value of money, and which, being an unknown quantity, is puzzling the most experienced observers. A fortnight ago, when the drain had but just begun, we stated our reasons for thinking that it would prove much less than was then generally supposed, and so far the event has confirmed our anticipations. Now, however, we would express the opinion that the drain, though checked, is not ended. In all commercial countries it is matter of experience that an augmented demand for currency

arises in the autumn. We feel it in England in October, and in Ireland and Scotland in November; whereas in America it is most marked in September. The explanation of the phenomenon is that the crops ripen all over vast regions so nearly at the same time that labourers cannot pass in any considerable numbers from district to district. Harvesting operations are going on at the same time over very extensive areas, and delay even for a day when the crop is ripe may be fraught with ruinous consequences. Hence there is an eager demand for labour, and wages rise in a few days a hundred or even two hundred per cent. Every one able to work is thus tempted into the fields, and the weekly wage expenditure is doubled, trebled, or, it may be, quadrupled. To pay these enhanced wages, the farmers must have actual cash, either coin or notes. In a country of the immense extent of the United States it naturally takes a much longer time to get back to the great cities the cash thus taken out than it does in a small island like Great Britain. Moreover, in the United States the cultivated area is yearly being pushed further and further into the wilderness, away from the region of banks. Thus the demand for cash is increased, and its return is delayed. Further, a very large proportion of the American harvest is grown for European consumption, and there is always a rush to get as much as possible of it to market early. This in its turn gives rise to another expansion of the currency. The dealers in the Far West have to pay cash to the farmers; they have also to pay for transport, storage, and so on. And as soon as the grain crops are "moved" the cotton crops begin to be garnered and sent to market. Thus harvesting practically does not end till Christmas, though the real pressure, as we have said, is felt about the third week in September. We are thus very close to the time when the stringency in the New York market ought to be greatest, but as yet there is no appearance of stringency. The rates for call money in New York are telegraphed 3 and 3½ per cent., the money market is reported to be easy, while the sterling exchange, the indicator whether gold is likely to be taken from Europe, is moving upwards. Even in the West the money market is not stringent, nor is there a large efflux of cash from New York. In Chicago, indeed, there is a very active demand for loans, but it is caused by a wild speculation in wheat, designed to force up prices. The speculators are endeavouring to keep back supplies, and thus to make the markets artificially bare and compel the public to pay exorbitant prices. To carry out the conspiracy, of course, they need immense funds, and they have borrowed fabulously. But it is incredible that a plot of this kind can for any length of time affect the money market.

So far, therefore, there is no symptom of such a tightness in the New York market as would lead to a heavy drain from Europe, and the reasons we assigned a fortnight ago for thinking it probable that stringency will continue to be prevented are still in full force. The Secretary of the Treasury has to redeem the bonds which have been called in for payment, and though they are being presented very slowly, they still will continue to come forward and to afford relief to the market. Besides, he has a large surplus of revenue over expenditure, which he will no doubt employ in buying bonds for the Sinking Fund. Lastly, he has to pay for several millionsworth of bonds formerly held in Europe, and sent over for redemption. Add to all this that the speculation for the rise which was carried on upon the New York Stock Exchange for nearly two years has during the past two months given place to a speculation for the fall; and that consequently there is not the demand in New York for loans for the Stock Exchange, which last year and the year before contributed so powerfully to enhance the value of money. But if it thus be true that money is not dear in New York, and is not likely soon to become dear, it does not seem probable that much gold will be sent thither from Europe. At the same time it is necessary to bear in mind that the damage done to the English wheat crop by the rains of the past few weeks will inevitably lead to a larger and earlier importation of American wheat than would otherwise have taken place. Had August been dry and hot, our own farmers would have sent their wheat to market without delay, and the foreign imports would have been postponed. But now the home wheat is too soft to be fit for grinding until mixed with a drier and harder grain. Consequently we must obtain early supplies from the United States, which thus acquire the power to take gold in payment. We have grounds for the belief that they will exercise the power sparingly, but the fact remains that we shall be in their debt, and that we must pay them somehow. There are three ways of paying them—by means of gold, of Stock Exchange securities, and of commodities. Could we choose, we should prefer commodities, and we are not without hope that we shall be able to sell to them an increased amount of commodities. But, doubtless, the Americans will take likewise both securities and gold.

#### THE BRIGHTON MUSICAL FESTIVAL.

FOR the first time there has been a festival and competition of the Orphéon Societies of France, Belgium, and Switzerland in England. The effect has been to make the town of Brighton for some days more like a town seen in a dream than anything in common experience, the curious contrast of the ordinary life of an English fashionable watering-place with that of a small Continental town *en fête* being at once interesting and bewildering.

The King's Road has been invaded by Fanfares and Harmonics, headed by their banners; the footpaths have been crowded by French and Belgian-speaking men in every variety of costume, from the full evening dress or frock-coat, black trousers, and white tie of the *bourgeois* to the ordinary clothes of the peasant in his best, finished off by a fancy cap. The Orphéon organization includes all classes of society, and by its good arrangement and uniformity of rules and regulations helps the formation of musical societies throughout France, Belgium, and Switzerland. These societies find rules ready to their hands, and receive a stimulus to work from the frequent contests which are held always under the same conditions in different small centres, as well as from the greater competitions which from time to time take place in the larger towns. From these contests the successful societies carry off crowns of honour, palms of honour, and medals, which, being fastened to their banners, are proudly displayed on Sundays and fête-days in their native town when they give concerts in the public gardens.

Some five or six and twenty of these societies have now come to Brighton; they include brass bands, brass and reed bands, string bands, and choral societies. As may be imagined, they vary enormously in merit, but even the worst appear to have worked hard, and gained much. By the rules of the contest, every competing society has to pass a test in reading at sight. A piece of music, specially composed, is given out; ten minutes are allowed for the performers to read their parts, and the conductor to study the score, and then the piece has to be performed. All these societies, composed, although they are, of *bona fide* amateurs, many of them lads from the plough-tail, are able, at all events, to attempt this feat. To attempt any detailed criticism of the performances of the separate societies would be to usurp the functions of the jury, and would be indeed impossible, since the contests were held at four different centres. All that we can say is, that many of the bands would contrast favourably with good military bands in any European service, whilst some of the choral societies present were extremely good. All showed good training on Wednesday afternoon, when some pieces were performed by about twenty different bands, massed together under a conductor strange to them all. The general effect was so good as to show that all taking part in the performance played as professional musicians should play—by reading their music and watching the conductor. Two concerts have been given at the Pavilion in which some of the bands and choral societies have taken part, aided by some solo singers from the Grand Opera, Paris. The music chosen was generally trivial and uninteresting, but the performance was above the average of professional concerts of the same class. As the interest of this festival is in the doings of the amateur musical societies, the professional singers must be passed over; but it would be ungracious not to notice the very dramatic singing of the air "Ah, mon fils," from Meyerbeer's *Prophète*, by Mme. Appia, at the concert on Tuesday evening.

When we ask ourselves what lessons we can learn in England from this visit of Orphéon Societies we find ourselves in doubt and perplexity. We have hardly any form of centralization of the same complete character in this country, with the exception perhaps of the Tonic Sol-fa, which only deals with choral societies; and, further, we have not in this country that life of leisure without idleness which is to be found in even large provincial towns in France and Belgium; so that, on the whole, we fear that we should never be able to compete with the instrumental societies of the Orphéon, as a band cannot be formed unless the members have ample leisure for private practice of their respective instruments. As far as regards choral societies, which make but little demand on the time of members except that given to combined rehearsals and practices, we think that already we possess many purely amateur and provincial bodies which would, to say the least of it, quite hold their own with any choir which has been heard at Brighton this year. Undoubtedly such associations do tend to do good to the cause of musical art. It is perhaps unlikely that they should produce any first-rate instrumentalist or composer, but the spread of technical knowledge of music which they produce must increase the critical power of the general public, and so react on the musical profession at large for its good. An indirect support of this view is given by the interest which has been taken in this Brighton festival by the leading musicians in this country, most of whom have accepted the post of members of the jury, and have in consequence devoted more than two days to hard work including many hours of listening to bands and choral societies performing the same music one after another. The prizes were distributed to the successful competitors on Wednesday night by the Mayor of Brighton at the Pavilion, amidst great excitement amongst their members and friends, the society of Ixelles in Belgium being very cordially cheered by their French and Swiss rivals, when their chief received the many prizes won by their band.

Although on the whole this meeting has passed off well and brightly, yet there have been some perhaps unavoidable breakdown in the organization. It would not be graceful or courteous to point these out, were it not that we hope that we may again have the pleasure of hearing one of these contests, and that by calling attention to defects we may help to remove them at some future festival. We therefore feel bound to take notice of the report that on Monday night many members of the Society were unable to get beds at all, and wandered about the streets all night. Whether this report be true or not, it is quite certain that much delay and inconvenience was caused at the concert by the omission of the seemingly obvious precaution of posting an interpreter at

the principal doors, which led to performers being sent wandering round the building and amongst the audience; while, again, there was no one at the post-office able to speak a word of French, so as to help the struggling crowd of people anxious to get their letters and money. Yet another effect of small faults in the machinery of the organization was that the printed programmes of the concerts were no guide to the performances given, which "by no means tended to the good temper of the audiences."

The sad accident at Charenton had caused the death and injury of many who were to have taken part in the festival, and subscriptions have been started to relieve the distress caused by this fatality. Several of the societies and some of the solo singers remained in Brighton in order to give a concert on Thursday in aid of the fund. In spite of this gloomy incident, and in spite of the slight failures in the machinery for their comfort, all the competitors seemed happy and pleased with their visit, and, indeed, had so strong a reserve of energy and good spirits that many of the bands gave open-air concerts on the beach entirely on their own account.

## REVIEWS.

### GARDINER AND MULLINGER'S INTRODUCTION TO ENGLISH HISTORY.\*

THIS *Introduction to the Study of English History* is made up of what are in fact two distinct works united for convenience in one volume, with a single index, and having only the further connexion of a common object:—"to provide some help for students who, having gone through the ordinary school course, wish to devote themselves to the special study of some part of the history of their country." The first step towards special study is to know what to study; and the second part of this book therefore contains a treatise on the authorities, contemporary and non-contemporary, for English history. This is the production of Mr. Mullinger, whose work, according to his colleague Professor S. R. Gardiner, is to be considered as "the kernel of the volume." Mr. Gardiner himself contributes the essay which precedes Mr. Mullinger's work. His conception of his subject will be best explained in his own words:—

No one can really study any particular period of history unless he knows a great deal about what preceded it and what came after it. He cannot seriously study a generation of men as if it could be isolated and examined like a piece of inorganic matter. He has to bear in mind that it is a portion of a living whole which is under his observation. The work of the constructive imagination comes in where the work of investigation ends. In the end this is a work which every man must do for himself. He will have to pick out from the manifold facts of history those which seem to him to be more important than the others, and it will never happen that any two men will be precisely agreed as to the relative importance of any set of facts. Yet it may not be altogether useless to those who are girding themselves to the task to have before them an attempt to trace the life of the English nation by one who has at all events given much of his time and thought in an attempt to realise to himself what that life has been.

This is a claim only too modestly urged. No historical student but will be grateful for the guidance of one so competent as Mr. Gardiner. Of his accuracy and research, of his peculiar impartiality, combined with great power of entering into the feelings of the past, it is superfluous here to speak. They are well known to all who have studied the yet incomplete series of works by which Mr. Gardiner has added so much to our knowledge and understanding of the Stuart period. It will be noted that in the extract just given the author speaks of "the work of the constructive imagination"; but for the reassurance of those who may think that the constructive imagination is apt now-a-days to play too large a part in the writing of history, we must say that he also impresses upon the student "how much his power of judging fairly the characters of history depends upon complete accuracy in the matter of dates and places"—words which cannot be too much laid to heart.

To give within the limits of a review any adequate notion of an essay which extends over the whole of English history, with an introductory chapter upon "The Ancient World," is of course out of the question. What perhaps most strikes one at a first reading is the skill with which the author has managed to make his essay vivid and interesting without the introduction of anecdote or of "word-painting"—in short, without ever stepping out of the character of an essayist and commentator. Sentences sharply expressed and full of thought and meaning might be extracted from it in numbers. Here and there indeed we mark a slip into that carelessness of composition which is the besetting sin of the present day. "He shrunk from the jealousies of the great English families, from the rough animalism of English enjoyments, from its want of polish and culture, and from its low ideal of the religious life." If it relates, as grammatically it should, to "animalism," it is difficult to conceive "animalism" as a thing that forms ideals, high or low. We question whether Chut could *allay* divisions, though he might re-unite or efface them. And it is at least awkward to say that "William II. threw himself into sheer oppression." We should not pause to make mere verbal criticisms, were it not that this carelessness on the part of good writers is a great and

growing evil. Two criticisms on matters of fact also suggest themselves. We are surprised to find so accurate a writer repeating the common mistake of calling Pandulf, at the time of John's submission, the Pope's Legate, a position to which he did not attain till later. On the next point we only suggest a doubt. Pointing a contrast between the ideals of the Church and of the State, Mr. Gardiner says:—

The great earl who stood up against Henry III. was known as Sir Simon the Righteous. The great king who took up and accomplished his task was known as the English Justinian.

This implies that each epithet was contemporary. The first of course was so; but the second has a more modern sound. If it is really of the period, we should be glad to know where it is to be found.

Within our limits, we can but direct attention to the passages dealing with controverted points or to a few bits of special power or striking thought. We turn to see Mr. Gardiner's views on the Teutonic Conquest. Here his characteristic caution shows itself. "Over all this tract," he says, speaking of the eastern side of our island, "the Low German speech of the invaders was to be heard. To what extent the British population had disappeared is a matter of controversy. It is a point on which no certain knowledge is attainable." But, while he commits itself to no theories as to the more or less complete extermination of the conquered, he points out that "the general result is certain. . . . The Celtic element, whether it was larger or smaller, was absorbed, and left scarcely a trace behind." When we come to the political institutions of the Teutonic conquerors, we find that Mr. Gardiner's views as to the Witan are rather those of Canon Stubbs than of Mr. Freeman. On the whole, throughout the pre-Norman period, Mr. Gardiner has evidently been chiefly influenced by the Canon, with whom he has probably more mental affinity than with Mr. Freeman. Though the latter has taught everybody Old-English history, though all writers on the subject are more or less his disciples, there seem to be few whom he has inspired with his own feelings of affection, enthusiasm, and loyal devotion for the Old-English people. At any rate, Mr. Gardiner plainly holds that, from Edgar to the Confessor's time, they were but a sluggish and *born* set, with a very imperfectly developed sense of nationality and an insufficient "moral and mental standard." He acknowledges the lordship of the West-Saxon kings over the Celts of Wales and Scotland; but it is almost in a spirit of levity. Edgar, he admits, treated the Celtic kings "distinctly as his inferiors"; but he disrespectfully adds that "it was perhaps well" for Edgar "that he did not attempt to impose upon them any very tangible tokens of his supremacy." The one "tangible token" on record—the triumphal progress of Edgar on the Dee—Mr. Gardiner rejects as a legend. Harold receives a fair allowance of laudatory epithets; but after all he is but "the ablest man of an unprogressive race," bringing no new ideas into politics or war—a view much resembling that taken by Mr. Green.

The Norman troops attacking, or flying in simulated rout, at the word of Duke William, or exchanging the combat of the horseman for the combat of the archer at his word, deserved, at least in a military sense, to win. William put his mind into the battle, Harold could but give his example.

Warmth and enthusiasm are not wanting to Mr. Gardiner when he comes to speak of the Church and of its services in consolidating England. His defence of monasticism—a fair and reasonable defence, and not a panegyric, for he admits the obvious faults of the system—is specially noteworthy. Another excellent passage is that in which he draws a comparison between the monks and the friars, "the last helpful gift of the medieval Church to the world." With the beginning of the fourteenth century the true work of the medieval Church ends, and there is nothing which fully takes its place. Mr. Gardiner indeed appreciates better than most modern writers the ideal of chivalry, which, as he says, "was to the medieval warrior very much what monasticism was to the medieval Churchman," and which, albeit in many respects unquestionably inferior, was yet, he considers, in some points higher than the monastic ideal. But this appreciation of the good side of chivalry does not lead him to extend his approval to the Hundred Years' War, which he, like Mr. Green, regards as almost wholly evil. To our thinking he is too hard upon Henry V.—

More unprincipled war there never was. It had not even the excuse which the war of Edward III. had, of the necessity of giving protection to the English trade with Flanders.

In fairness it should be remembered that Henry V. must have grown up, like other Englishmen of his time, in the belief that to conquer France was the mission and vocation of England. That Englishmen should rule in France seemed then as natural and justifiable as that Englishmen should rule in India now. Nor does Mr. Gardiner ever seem to take in the fact that it was the French who broke the treaty of Bretigny, and that, technically speaking, Henry only continued an existing war. Though he is less rigorous towards Edward III., even there he hardly sets the case in a fair light. There is not a word of the assistance given by Philip to the Scots, no apparent consciousness that the actual breach of the peace came from Philip. It is easy for a writer to set up a theoretical standard of morality unknown to practical men at the time—indeed far above that followed by the men who do the rough work of politics and war in our own day—and then to condemn them for coming short of it. Mr. Gardiner's remarks on the Hundred Years' War should be compared with those, made, we venture to think, in a more reasonable and truly historical

\* *Introduction to the Study of English History.* By Samuel R. Gardiner, Esq., LL.D., Professor of Modern History in King's College, London, and J. Bass Mullinger, M.A., St. John's College, Cambridge. London: C. Kegan Paul & Co. 1881.

spirit, by Mr. Freeman in his first series of *Historical Essays* and by Canon Stubbs in his *Constitutional History*, especially at p. 73 of his third volume, where Henry V. is judged with perfect fairness.

On the other hand, we turn with satisfaction to the passages dealing with Wycliffe, with the Peasant Insurrection, and with the general social movements which were connected with Lollardism. The modernization of the famous doctrine of Dominion is particularly happy:—

Stripped of its scholastic and ecclesiastical form, Dominion founded on Grace was the doctrine with which we are so familiar at the present day, that no authority or institution can, in the long run, justify its existence except by the services which it is capable of rendering.

Mr. Gardiner's account of the Star Chamber, whose dominion, hateful as it became, was originally "founded on grace," will be read with great interest, this being a subject on which he is known to be strong:—

Henry VII., indeed, did not leave the constitution quite as he found it. Lawyers tell us that the court of the Star Chamber was derived from the ancient jurisdiction of the Privy Council. But it was reinvigorated by Act of Parliament in the early part of the reign of the first Tudor king, and, for all practical purposes, it may be held to date from his time. Consisting, at first, of certain royal officers and one of the chief justices, and ultimately, of all privy councillors together with the two chief justices, it was a tribunal formed to take cognizance of all cases in which justice was not to be had from the ordinary courts. It could not take away life, and, till later times, it did not claim to punish by more than fine and imprisonment. The full exercise of the powers which had been given to it was a healing measure. Wherever a powerful landowner enjoyed or bullied juries, wherever faction banded men together to oppress the innocent, the Star Chamber righted the balance. Hurried off to Westminster, the offender found himself in the presence of judges whom no bribery would influence, no threats divert from their course. The time might come when the king would separate himself from the national feeling, and when such a court might convert itself into an instrument of oppression. For the present the Star Chamber was the weapon with which the oppressed armed the king, that he might strike the oppressors down.

The chapter on the Tudor Monarchy, from which this extract is taken, is one of the best parts of the book. The strange and complex character of Henry VIII. is well interpreted, though not after the manner which would satisfy Mr. Froude, whose feelings will perhaps be shocked by the blunt and uncompromising way in which Mr. Gardiner puts things:—"Henry threw off the authority of the Pope simply because he was tired of a staid and elderly wife, and had fallen in love with a flighty young woman." At the same time his nobler side is recognized, and the picture presented of him is a striking and probably a true one.

We have left ourselves no space to dwell upon Mr. Gardiner's treatment of the struggle between the first two Stuarts and Parliament. How ably and how impartially—unless it be objected that he perhaps hardly does justice to Laud and the High Churchmen—he treats that period, can be imagined by all who have read his previous works. Nor can we quote, as we should like to do, the passage at p. 173 on the characteristics of what may be conveniently termed the Hogarth and Fielding period. The essay virtually ends with the Congress of Vienna, though the concluding paragraph lightly sketches the state of things down to our own day.

As it is, we fear we have been somewhat neglectful of Mr. Mullinger, whose part of the joint work, though likely to be of great use to the student, does not afford so much material for comment. To some extent it may remind the reader of Mr. Gairdner's recent book on the Early Chroniclers of England, but with a considerable difference. Mr. Gairdner's book is a popular and entertaining account of the "early chroniclers" from Gildas to Holinshed; Mr. Mullinger is drier and briefer; his treatment of his subject is less biographical, more purely literary and critical, and he is more strictly a guide to the student in choosing what to read, and in estimating each author's value as an authority. His plan moreover is a much larger one, as he takes in the authorities for the whole of English history, starting with modern writers upon the science of language and the comparative history of institutions, and thence proceeding to "Contemporary Writers," first among them Cæsar and Tacitus; "Non-contemporary," but still ancient writers, such as Gildas and Bede; and "Modern Writers." These last are only mentioned when they are really good authorities. Histories, "such as those of Oldmixon, Barnard, Henry, Hume, Smollett, and Sharon Turner," which have "become, for the purposes of research, confessedly obsolete, not simply from their defective method, but as derived from a very imperfect acquaintance with the original manuscript sources," are not included. The care with which the contemporary sources of information are distinguished from those of later times is an excellent feature; and the criticisms on modern works are judicious and impartial. Some account is also given of the various collections and editions of our old writers. In conclusion, we may say that this work will be a great help to every one who wishes to know more of its subject than can be learnt from the ordinary school books. Mr. Gardiner supplies an admirable general idea of English history, as it presents itself to his mind. Mr. Mullinger puts the inquirer in the way of forming, if he so chooses, an opinion of his own.

#### RUGBY, TENNESSEE.\*

THE history of a nascent community has about it the same kind of interest which always attaches to the earlier portions of a biography. We delight to hear of the infant ways and

sayings and doings of great men, and of all for whom we have reason to feel any special regard. What "the young Alcibiades," to use the favourite phrase of biographers, did or thought may be more eagerly read about than the account of his performances in mature life. Hope and the beginnings of a career have charms which do not belong to certainty and success. Where little is yet done everything remains in expectation; and imagination may be permitted a freedom of play to which a stop must be put when good intentions are realized or when bright projects have failed. The President of the Board of Aid to Land Ownership, Limited (a Company incorporated in England, and with powers from the Legislature of Tennessee), cannot, however, be accused of holding out a too brilliant inducement to intending settlers. The invitation to the new Rugby is not for those who wish for swift and easy fortune-making, but only for those who are ready to toil and be patient in the acquisition of wealth. The young men of England educated at our great public schools are informed of a spot in the New World to which they may transfer their intellectual culture and their physical training, to lead a life of some mental activity and of hard, useful labour, in which they may gradually exchange dependence upon others for competence, and do good work in reclaiming an untouched soil and in developing the wealth of one of the finest districts of the United States.

It is not, of course, to public school men alone that the offer is made; but the name of the new settlement, no less than the arguments used in its favour, indicate them as the class from which recruits are chiefly expected to come. Every nation almost has in all periods of history sent forth its excess of population to occupy fresh regions, and colonization, with more or less of goodwill towards existing occupants, has been the normal mode in which the geographical extension of the human race has been effected. There is nothing, therefore, peculiar in the fact that our own country should still be seeking what has always been the natural remedy for a people unable to find room in their native land. But that which is without precedent is the great number of persons for whom their own country is now unable to find remunerative employment, and whose social position and education unfit them for any but what are usually taken to be the only fit occupations for gentlemen—the Church, law, medicine, the public services (civil, naval, or military), or the higher kinds of commerce. Our old friend Will Wimple of the *Spectator* is selected as a type of the idle younger son of the landed gentry—willing to do serious work, but unable to find any. It is admitted that the prejudice against engaging in trade which until recently subsisted in our upper classes is now nearly extinct, and that many more ways are now open. But it is also affirmed with truth that the ways are not enough for the wants of those who would follow them. For to the ranks of the gentry are now added the wealthy professional, commercial, and manufacturing classes, who send their sons also to the public schools to be educated along with the sons of the old county families. Mr. Hughes holds that the spirit of our highest culture—that is, in his opinion, the spirit of the public schools—and the spirit of trade do not agree together, and thus one way is practically closed, even if want of capital or private connexion did not otherwise effectually bar the entrances to a life of successful commerce. Now, taking the spirit of trade in its best sense, and declining to believe that all trade pursuits in England are so tainted with fraud and corruption that no honest man of any grade can engage in them with a good conscience, it may be asked whether the spirit of the public schools may not be in fault as well as that of trade. There is still existing a pleasant belief that an English gentleman is the best specimen of the human species under civilization which can be produced, and that he is the product of the English public schools, because no other country of Europe has similar educational institutions. Probably the typical "Christian, scholar, and gentleman" of the last generation or two knew, or, at any rate, cared more for, Greek and Latin, and had played much less at cricket and football, and pulled much less in boats than his son did or his grandson may now be doing. The author of *Tom Brown* is bound to maintain that Arnold was the leader of a great reformation—indeed, to be compared to a Luther, while Rugby is the Wittenberg of the educational change—and no one can grudge him the pleasure of having said so in an address about the new colony recently delivered at his own old school. But we have surely had something too much of this; and it has to be considered whether public schools, like many other cherished institutions, are not now on their trial; and whether they really do give the best education, in the sense of best fitting their pupils for the future duties of life. It is conceded that, in one respect at least, they do not; their spirit is antagonistic to the spirit of trade. Does their attempt at teaching Greek and Latin, and their extravagant addiction to sports, however manly, justify their claims to being exclusively in the right, and to withdrawing from home influence for so many valuable months and years the best of the male youth of our land? There is an element, too, of sham and pretence even in the great schools, which must be heartbreaking to their able and conscientious masters. So many parents do not really want their sons to be taught Greek and Latin, or, indeed, anything else that is taught. They look chiefly to the friendships which, it is hoped, may be formed, and to distinction in the boats or in the cricket field. The recent most reasonable demand for a better knowledge of French in candidates for commissions in the army has not been met generally as yet in the right mode by the public schools. On the Continent French and Germans and Italians are beginning to teach their children English; they know the use of it. We do

\* *Rugby, Tennessee.* By Thomas Hughes. London: Macmillan & Co. 1881.

not teach modern languages as they should be taught in what are our best places of education. An English army under conceivable circumstances might fare as badly without officers knowing French or German as the French army did ten or twelve years ago, when its officers knew no German. An English public school boy is ludicrously helpless in travelling on the Continent. He is supposed to know some Latin and Greek—which in reality he probably does not—but of French and German, which he might much more easily learn, he is practically ignorant.

Many of the schools now have workshops in which the use of carpenters' and other tools may be acquired. Unless room is made for this additional distraction from the other business of the place by diminishing both the compulsory work and the compulsory play, it is difficult to see how due attention can continue to be given to it. The suggestion also cannot fail to arise whether the knowledge gained in the workshop is, after all, a proper element in a liberal education, and ought to find a place in the curriculum of a public school. Poor Louis XVI. was certainly not a better king for his pursuits in lock-making; St. Paul did not make tents with his own hands, nor did Demosthenes actually work in his father's forge. If the thing could be done seriously, it would no doubt be a better preparation for some powers of utility in after-life if the time now so largely and enthusiastically given to football and cricket could be given towards obtaining some practical acquaintance with mechanics and other useful branches of physical science. So it might be better, if possible, to have the means of acquiring some knowledge of farming and gardening; but again the question arises, Would this supposed useful knowledge be really of any use? Diocletian did not take to planting cabbages until he had ceased to be Emperor, and he had no intention of turning market gardener. And, after all, the best place for learning foreign languages must be in the countries where they are spoken, or, at any rate, under the tuition of a native at home. The best place for learning mechanics must be in a real workshop; and to fit young gentlemen to become farmers at Rugby, Tennessee, or elsewhere, the training of real farm life in England must be superior to anything else.

As might be expected, the great trading classes of England do not find much mercy at Mr. Hughes's hands. The denunciations of Carlyle and Emerson against Mammon-worship are quoted; and little credit is given for the existence of any true desire to carry on in a faithful tone the operations of trade and commerce without which the world could not live. In addition to former evils, the upper section at least of the traders is now being drawn in to share the besetting sins of the class who alone formerly sent their sons to a public school. The richer among them send their sons to Eton, Rugby, or Harrow, or to some other of the old foundations, or to one of the many new schools which have been laid down on their exact lines; and here, it is said, they learn to love luxury and to dislike commercial pursuits. At the same time are springing into existence hundreds of new colleges or revived grammar schools, all endeavouring to be as much like the old schools as they can, and for the most part officered by men who have been trained in them. Does not all this inspire the thought that there is more urgent need to reform our schools at home than to provide colonies in which the wants of their old pupils are to be specially provided for? And this thought may well be entertained while fully recognizing the manly and generous feelings which are fostered in our public schools, to which the country has in past times at least owed so much.

The handicraftsmen of England, as might also be anticipated, do not fare so ill with Mr. Hughes as those who used formerly to be called their betters. Nevertheless, it is not asserted that they are faultless. Their work is sometimes scamped; the honesty, simplicity, and thoroughness fondly believed to have been universal in the olden time are not now always to be found. But a glorious future may be anticipated when "labour will be king," and then all will be righted. This happy forecast of the future may, however, be advantageously read along with Mr. Hughes's notion of the history of the past, for its value can then be more exactly appreciated. According to his strange and perverted reading of it, the gentlefolk of England, having had the undisturbed management of public affairs up to 1830, landed the country "on the verge of revolution and bankruptcy." Again, for the last fifty years the trading or middle class have had their share in government, and they have "brought trade to such a pass that an honest man cannot live by it." And "the sanguine hope" is encouraged that the handicraftsman "will use power less selfishly than the previous owners of it"—as if such things as Trade-Unions and criminal interference with the rights of private labour had never taken place. But, for the present at least, it is not for these, our masters of the future, that the advantages of Rugby, Tennessee, are set forth.

The account given of his visit last year by the President of the Board of Aid of Rugby is genial and amusing, as it was sure to be—only we read with regret his report of the increase of gambling on board the best American liners. It is perhaps not surprising that this should be so during the enforced idleness of a voyage across the Atlantic; but it is rather surprising that it should be encouraged under the excuse that a percentage of the winnings is almost always paid to a charitable institution. The danger of learning a pernicious habit should not be permitted to exist; and the practice must be a great nuisance to those on board who do not play. Among the pleasant matters mentioned, not the least is the fact that the hotel at New Rugby is called the "Tabard," after

Chaucer's old hostelry, and was so named on the suggestion of one of the American members of the young settlement—who also contributed to its fabric some relics which had been bought by him at the sale of the materials of the ancient inn in Southwark. To the book is appended what is called a glossary, being in fact an index of its contents, and from which more can be got almost at a glance in the way of information on the contents of the volume than is usually the case. It seems a good plan, and deserves imitation. It deserves especial recommendation for the convenience of reviewers who may desire to eviscerate a new book without reading a line of it, as well as for its proper and legitimate uses. An intending settler may get from it nearly all the details of the prices and other things which he wants to know. The climate is excellent and the country beautiful. The variety of produce which may be raised with advantage is considerable. The vegetation is magnificent, and the wild animals are enough to afford fair sport. Upon the insect fauna the glossary only speaks once, but that mention is favourable; and, imitating the well-known account of the snakes in Iceland in Peter Horrebrow's Natural History of that country, it contains the highly satisfactory heading "Mosquitoes:—None." It is only unfortunate that the appearance of the book should have been followed at a very short interval by decidedly discouraging news as to the fortunes of the new colony. Let it be hoped that the depression is but passing.

#### IVY, COUSIN AND BRIDE.\*

AN industrious novel-writer who does not repeat himself is by no means a common person, and Mr. Greg seems to be becoming an industrious novel-writer, while he most certainly does not repeat himself. Except for certain probably unconscious touches which show not dissimilar ideals of character, *Ivy* is entirely different from *Errant*. The latter was emphatically a story of incident, of numerous characters, of events occurring during a long period of time. *Ivy* is as emphatically a novel of character and situation, minute in its touches, limited in its scope. If we say that Ethert Glynne, the hero, is remarkably like Lionel Darcy, we shall probably make Mr. Greg rather angry; and we shall make him still more angry if we say that the likeness consists in a certain wrongheaded obstinacy of character for which the author has a lurking sympathy, though he distinctly protests in this book against the supposition of this sympathy. Mr. Greg, who is apparently a practised reviewer (he makes statements in his book which render the inference permissible), must surely know that any experienced critic can distinguish at a glance the characters which a novelist depicts because he likes them and sympathizes with them, from those the creation of which is a mere exercise of his art, and those in which he is purposely gibbeting something that he does not like. But if there is this likeness between *Ivy* and *Errant*, it is the only one; for the new book to all intents and purposes breaks quite fresh ground.

The central point of the situation which Mr. Greg has taken for study is not, perhaps, absolutely original, for novelists before him have chosen the subject of a marriage which, owing to misunderstanding, is a marriage only in name. The way, however, in which this central motive is set to work is quite new. Ethert Glynne is a young man of talent, who has written books that do not pay, and has burdened his very small means by adopting the daughter of his old tutor. So, though he is the nephew of a very wealthy baronet, and next heir but one to the title, he is glad to accept the post of what may be called devil to the editor of a newly-started Tory newspaper. Of this newspaper and its ways Mr. Greg has given a minute and curious account. We rather doubt whether its principle—which combines an almost entire severance of the different departments under responsible chiefs with what may be called the council system—would work in daily journalism, but it may be granted that, if it could be got to work, the result would be probably a good deal superior to the general run of newspapers. However, the *Courier* plays but a subordinate, though a not unimportant, part in the novel. For some reason, inexplicable to Ethert, his uncle and aunt (who have always been very kind to him, and as liberal in point of money as his somewhat intractable nature would let them) oppose the scheme of his proposed attachment to the staff of the *Courier* very decidedly. He has two cousins, both young. Charles, the heir to the baronetcy, is about eighteen; Ivy, his sister, who is a special pet of Ethert's, though in a very different way from that in which he looks on his protégée and adopted daughter Meta Mordaunt, is a year younger. To Glynne's intense surprise, the family lawyer plumply asks him, "Why do you not marry your cousin?" and his uncle and aunt, their ambassador's errand having been fruitless, repeat the proposal, Sir Charles Glynne even offering to resign his seat in Parliament in Ethert's favour. Now Ethert is extremely fond of Ivy, but not in the least in love with her; while, if he is not exactly in love with the child Meta, he has a kind of indistinct romantic intention to be very much in love with her some day. He therefore rejects the proposed honour with something like indignation, and goes to his newspaper work in London. However, the fates are too strong for him. Charlie Glynne, a reckless rider, is thrown from his horse and killed; Sir Charles has a paralytic stroke, not for the first time; and, Ethert being sent for, Lady Glynne at last makes a clean breast.

\* *Ivy, Cousin and Bride*. By Percy Greg. 3 vols. London: Hurst & Blackett. 1881.

of it. Sir Charles, it seems, is a bigamist; his first wife is still alive; Lady Glynnne is not Lady Glynnne at all; the children are illegitimate; Ethert is heir not merely to the title, but to the estates which are strictly entailed, though Ivy would have inherited had she been legitimate. Not only does Mr. Brand the lawyer refuse to be a party to a fraudulent concealment, but there is another person who knows the secret and regards it merely as a matter of money. Ethert is, therefore, entreated to marry Ivy out of hand as the only means of preventing the stain on her and her mother from being known, of providing for both (for Sir Charles has saved nothing), and of consoling him on his deathbed. Ethert, after no small struggle, makes up his mind to comply; though unfortunately, after the manner of man, he does not do the thing ungrudgingly. He commissions Lady Glynnne to go through a process of explanation which (inasmuch as it is agreed that Ivy is to know none of the actual particulars) is certain to be more or less of a farce, and, considering Lady Glynnne's nervous fear of exposure, something even more than a farce. Then he makes his proposal in a singularly ungracious fashion, and is accepted by the unfortunate Ivy, who really loves him, with a certain hesitation due only to her youth and temperament. He accordingly makes up his perverse mind that she, like himself, is the victim of compulsion, and regards the marriage as a hateful bondage. Such is the situation which Mr. Greg develops in his first volume. How he finally works it out, and to what end he conducts it, we shall, as far as details are concerned, leave the reader to find out for himself. Ethert carries out what he regards as his bargain with a kind of wrongheaded persistence which the author makes one of the other characters justly describe as feminine. He refuses to regard himself as in any sense the proprietor of Glynnehurst, the family estate; and while he induces his wife to spend on improvements nearly all the income of the estate itself, which has been much neglected, he insists on continuing his drudgery at the press. Ivy, who desires nothing better than to be his wife, is practically his wife only in name, and is bitterly hurt at the manner in which he treats her. Indeed, if Mr. Greg had asked us to give him a title for the book, we should have suggested "The New Griselda," for nothing more excruciatingly painful than Ethert Glynnne's behaviour to an innocent and affectionate girl could very well be imagined. It is in the delineation of the exquisite wrong-headedness with which Ethert pursues his course of (as he thinks) honourable and virtuous conduct that the specialty of the book consists. Mr. Greg has followed the turns and twists of the character with an affectionate persistence only comparable to that with which some French novelists study elaborate and recondite forms of immorality; and, it is fair to add, with not much less power. Nor is his performance in drawing Ivy's character less remarkable. It is, of course, true enough that while it is the rarest thing in the world to find a woman who can draw a man's character, the novelist of the ruder sex who can draw women as they are are tolerably numerous. But of late years at any rate, very few writers of fiction have cared to draw such a character as Ivy's, in which the old mediæval idea of submissive grace and patient endurance of wrong for love's sake is illustrated rather than any more modern type. In these last two volumes the minor characters play a less important part than in the first, though they contribute duly to cut the knot. Except, however, Lestranger, the editor of the *Courier*, who is drawn as if Mr. Greg would like to say more about him than he actually does say, they are of comparatively little importance to the action.

As in most of Mr. Greg's books, politics play a not inconsiderable part; and the author has availed himself of his opportunity to deal some hard knocks at the side which he does not favour. The description of the late general election as "the only one in the whole history of the country which was won by hard lying" has been anticipated, perhaps, in more roundabout phrase, but hardly in so many words. The admirers of the persons who are thinly disguised as "Philhellen" and "Blight" will not like Mr. Greg at all. More dubious, perhaps (for, after all, there is no reason why a novelist should not have his politics and indulge in them, if he is prepared to pay the almost inevitable penalty of risking his popularity with those who are not critics enough to discard such considerations), are some transparent allusions put in the mouths of the characters to the fortune of his own previous books. There are one or two slips of fact. It has for years been rarer and rarer for journalists of the higher class to qualify themselves by passing through "the Gallery," unless the leader-writer who is nothing but a leader-writer, and who goes to the Gallery to write, is to be considered a reporter. Mr. Greg is under a wrong impression when he says that to gain a Fellowship before taking a degree is "a very rare honour." For many years, at Oxford at least, most, if not all, Fellowships have been open "to those who have passed all examinations required for the degree of Bachelor of Arts," whether they have put on their gowns or not. There is, moreover, one persistent solecism of language which astonishes us in a writer who is generally careful and correct. This is the use of the hideous phrase "it don't," "he don't."

On the whole *Ivy* can be recommended pretty strongly to persons who are able to recognize accurate drawing of character, whatever it is, and still more strongly to those who appreciate pathos. It is no slight proof of a novelist's ability that he should have been able to depict the scenes in which Ivy's affection, sense of duty, and womanly pride struggle with her feeling of the altogether undeserved and unintelligible withholding of her husband's affection. The very fact that, so far as she knows, she is bestowing on him wealth

and position which somehow or other he refuses to accept, and that at the same time the refusal does not seem to satisfy his wayward sense of independence, is sufficient in the case of a girl of seventeen to cause endless bewilderment. Mr. Greg has conducted his heroine safely through the difficulty, and it is only ferocious and shrieking advocates of the equality of woman who will decline to recognize in her a pearl of her sex. As to the character of Ethert Glynnne the case is somewhat different. We shall not say that he is impossible. A young man of some talent, of a rather crossgrained nature, and habitually spoilt by the people round him, might possibly arrive at such a pitch of morbid self-consciousness, of toady-turvised dignity, of indifference to any and everybody's suffering in comparison with the indulgence of his own fantastic point of honour. Whether he could at the same time maintain the nobility and generosity of character which the reader is apparently expected to recognize in Ethert Glynnne is a point of psychological argument on which there is probably no necessity to decide here. We have left unnoticed some minor scenes and characters which are good. Meta, the spoilt darling, reappears in the third volume, and is, in a way, a bond of union, instead of, as might be expected, disunion, between the unhappily matched pair. The way in which this circumstance is made to bring out yet another virtue in Ivy's crown is ingenious, if improbable. It has been laid down that no woman is worth anything who is not jealous, and in that case Ivy certainly suffers. But, after all, Griselda was not jealous; and some people, at any rate, decline to regard Griselda as other than an honour to her sex.

#### COFFEE-PLANTING IN SOUTHERN INDIA.\*

THE Latin quotation with which the author concludes his work might surely have reminded him that a good deal of his experiences have much less of novelty to an Englishman than the journey from Rome to Brundisium had for the contemporaries of Horace. Nearly the whole of the first volume is absolutely unnecessary. About one hundred and fifty pages are occupied with trite and trivial details about the outward journey from Gravesend to Colombo. It was surely needless to tell us what the Essex marshes looked like, how wagtails and larks settled on the ship in the Mediterranean, how very comfortable is thin white flannel in the tropics, and how wonderfully the little black boys dived to pick up small coins in Aden Harbour. All this has been told us over and over again. Even the account of Port Said, the Canal, the miserable Arab villages, and "Ismaïlia," has almost ceased to present any novelty. When the author arrives at Colombo he devotes more than one chapter to a very superficial account of that place, and tells us little about Candy, Buddhism, and colonial hotels that we did not know before. Why he went to Ceylon at all is not very clear. His destination was a coffee estate in Southern India, and he had better have availed himself of the mail steamer to Bombay, and either have dropped down the coast or taken the train to the Madras Presidency and the Nilgiri Hills. Probably by the time he got to India he had found out that the "brown-skinned Hindoos," whom he first saw on the *Almora* steamer at Gravesend, were, in reality, brown-skinned Mohomedans, and we might presume that a notice on a board at a railway station in Ceylon was not written in Canarese, as in the text, but in Cinghalese. In fact, these two volumes contain exactly 732 pages of print, and a single volume of just half that amount would have sufficed for all the author's discoveries of strange facts.

For the author, simple or "griffinish"—to use an Anglo-Indian phrase—as he was on starting for India, was really placed in a new position of influence and authority where he had many opportunities of picking up curious and suggestive facts. Coffee-planting is a recent development of industry in India. Many years ago Anglo-Indians bought coffee estates and bought dear experience besides, in Ceylon, at Pussilava, Katchiganava, Nuwera Ellia, and other places, and a few feeble attempts were made thirty years back to introduce the coffee plant in portions of what is known as the South-Western Agency, in Hazaribagh and Lohardugga in Bengal. But indigo had waxed and waned and tea-planting had risen on the downfall of indigo, and capital had been attracted to Cachar, Assam, and Darjeeling before coffee-planting in Coorg and the Wynnad was seriously taken up as an industry of importance and value. Now, however, it bids fair, unless depressed from its due elevation by gold-mines, to become an additional source of wealth to capitalists, and of employment to adventurous young Englishmen as well as to hundreds of natives. And if Mr. Arnold had resolutely kept from pen and ink, except for the purpose of writing home, till he left Calicut and began to experience the discomfort of travelling in a cart drawn by a couple of oxen, and in the *muncheel* of which Mrs. Guthrie writes so pleasantly, we should not have had to read several hundreds of unnecessary pages and to write a few lines of necessary criticism.

Mr. Arnold's destination was a coffee estate on the Annamalli Hills, a tract situated in the Madras district of Coimbatore, and adjoining the native States of Oochin and Travancore. Indeed the Annamallies eventually blend with the Travancore Hills. The term itself means "elephant mountains," and hitherto this hilly forest has been the resort of the above animals, of the bison and sambur, and of aboriginal tribes known as Kaders, Malassers,

\* On the Indian Hills; or, Coffee-planting in Southern India. By Edwin Lester Arnold, Author of "A Summer Holiday in Scandinavia." 2 vols. London: Sampson Low & Co. 1881.

Puligara, and Maravara. It was on one of the ridges of these hills that the author began work as a *chik-doree*, or assistant coffee-planter, in a wooden or log hut, which was dignified with the name of a bungalow, though by its description it seems to have been in size and comfort far below the standard of the worst dawk bungalow, in the least accessible districts of Bengal or the North-West Provinces. The sides of the hut were made of poles and saplings, to which a coarse mat was attached. The roof was thatch, and by no sort of means impervious to the rain of the monsoon. We do not read of glass windows, and the beds, tables, and furniture were of the rudest description. The estate itself comprised about two thousand acres, which we gather to have been bought from the Raja of Cochin. The Madras Government, we may observe, is ready to sell its forest lands on the Annamallies at an upset price of 10s. an acre. Of these two thousand acres hardly two hundred had been brought into actual cultivation when the author went there. Indeed the clearance of these dense jungles is no easy matter. There is scarcely anywhere a level spot. The "estate" is a succession of hills and ravines. They often are covered with forest timber, now and then strangled by a huge undergrowth of creepers and shrubs. One of the first objects of the planter is to cut roads in two or three directions, to clear spaces, and yet to leave judiciously belts of timber unfelled, which may serve as a protection from the furious bursts of the monsoon. Then, authorities differ as to the proper size for clearings. Some are for large spaces and freedom from jungle, insects, and weeds. Others prefer small plantations with sheltering trees and plenty of vegetable mould close at hand. Where the jungle has been cut and cleared, beds are prepared for the coffee of which each seed is planted about five inches from its neighbour. Next, the seedlings have to be planted out, and this was done on the author's estate by enclosing the young plants in small wicker baskets filled with jungle mould. During all these processes the native workmen, who are only induced to come up from the plains by good pay and fair treatment, have to be watched, drilled, doctored, and superintended. And in the case of a newcomer, ignorant of the languages and customs, it required close and constant attention to avoid deceit and imposture, and to get a reasonable amount of labour out of a weakly crew of men, women, and children, without hasty resort to intimidation or violence. We must do Mr. Arnold the justice to say that, though he was speedily initiated into native dodges and subterfuges, he appears to have treated his coolies with consideration and kindness, and, though at a distance from policemen and tribunals, never unnecessarily to have taken the law into his own hands. But the defections and tricks of natives are not the only trials of coffee-planters. Though at a considerable elevation, the bungalow was not above the fever-line. Rains beat heavily and winds blew violently on the ill-constructed hut. Mists, charged with malaria, rose from the surrounding jungle. Cholera broke out amongst the natives, as it invariably does when the plainest dictates of sanitation are hourly defied. The daily amount of physical labour exacted from the superintendent and his assistants in making roads, burning stumps, visiting the nurseries and pits, or, we should say, showing several hundred coolies how all these operations were to be performed, was exhausting; and even the frames of active and not intemperate Englishmen are not proof against this daily wear and tear. Other disagreeable incidents occurred. The jungles were full of leeches, which got inside boots and stockings. Amusements and recreations there were hardly any. It is a notable fact that everywhere in India the sportsman has the fewest chances in dense forests, though, from the tracks seen, they may be regularly swarming with game. Elephants crashed through the forest, and occasionally came down on the huts of the coolies; and once an unfortunate native superintendent or *mistari* was pounded to death by a savage and solitary bison. We are glad to say that the poor man's death was speedily avenged by an old Madras *shikari*, who had been employed on the estate as cook. But beyond an occasional Sambur deer, a large squirrel, and, we are sorry to say, a couple of monkeys, no large animals were bagged. When the lagged planters got an occasional holiday, they were glad to spend it in a visit to some neighbouring planter, better furnished with what in late Irish discussions have been humorously termed the "decencies and improvements" of life. These excursions were not accomplished without a good deal of fatigue and climbing; and once or twice the young adventurers got spiked by long jungle grass, or missed their way at night, or had a narrow escape in crossing a raging torrent, or were nearly smothered by the hot ashes, the remains of a fire lit to burn up roots and stems. One ancient settler was driven from the hills by fever, and an incautious young assistant nearly shot his toe off; but the young men kept up their spirits wonderfully, made the most of New Year's Day and other festivals, and behaved as our countrymen have a happy knack of doing in isolated and strange places. The views, especially when the atmosphere had been cleared by rain, were diversified and splendid. There is no snowy range in Southern India, but the eye could take in a succession of green ridges, occasionally dotted with white bungalows seemingly close at hand, but half a day off, and could reach to the distant plains, with their large spaces of cultivation and lines of villages shrouded in palms. Mr. Arnold seems to have had a turn for botany and zoology, and to have gathered rare ferns and lovely specimens of butterflies, some of which were as large as small birds; and he gives an account of a feast held by his coolies, in which one of their number was dressed up to represent the evil spirit of the jungle, and kicked and cuffed; and there

was afterwards a display of fireworks, much beating of tom-toms, and a great consumption of rice. But his means of communication with natives were evidently imperfect, and we gather that his time was so occupied that he had no leisure to lay in any foundation of Oriental lore or to learn grammatically the languages, Canarese and Tamil, with which he had most to do. We are not surprised to be told that hard work, and life in a bungalow not waterproof, brought on repeated attacks of fever. To get rid of a racking succession of cold and hot fits, where the Englishman is his own doctor and rest and quinine are the only specifics, there is nothing for it but a total change of air. Mr. Arnold inhaled sea air at Bejapore and a purer mountain breeze at Ootacamund, of which station he gives a pleasant account; but when once the jungle fever enters the bones and marrow, a sea trip ending at Southampton is the only remedy. We are glad to say that the return voyage is not described at the same length as the outward trip, and we trust that the air of his native country or a second visit to Scandinavia may put Mr. Arnold in a condition to defy fever or to discipline coolies once more in the East.

We have never been of those who anticipate inordinate profits from any new commercial enterprise in India which is pompously heralded as some wonderful combination of native resources guided and controlled by the capital and the superior intelligence of the Anglo-Saxon race. There will always be obstacles and drawbacks to speedy success in any such venture. In older and settled provinces there is the difficulty of complicated land tenures, divided ownerships, and contracts with natives on whom such obligations sit very lightly. There are difficulties about communication, though these are rapidly yielding to the energy of an improved administration. There will always be troubles about the supply of labour. Coolies fall sick, lose heart, die, or abscond, often at the season when everything depends on continuous work. In remote regions, such as the Annamallies, the Nilgiris, Assam, or parts of the Central Provinces, there may not be the same perplexities of ancient tenures and grasping lessors to annoy and worry settlers. Lands here may be bought outright for a moderate sum, and held, as we should say, in fee simple. The jungle of subinfeudation, as it has been termed, has not here sprung up in addition to the jungle of nature, and it will be the fault of the purchaser if it does. But distance, isolation, a climate endurable but alternating between dry heat, choking mists, and drenching rains, and a forest on which the axe makes but slight impression, render the task of the coffee-planter or superintendent by no means light and easy. That there is a hopeful future for coffee-planters we have no doubt. And it may be gratifying to shareholders to learn that young men sent out to a picturesque Hill Station can live in fair comfort on 100rs. or 120rs. a month, or at least that they can have no irresistible temptations to extravagance. But proprietors and shareholders will be better served in the end if they provide their managers with decent residences instead of frail huts of matting and saplings. If comfortable houses can be built everywhere else in the hills, there is no excuse for neglecting this obvious first necessity of a healthy existence at the Annamallies.

#### THROUGH THE RANKS TO A COMMISSION.\*

BY all who take an interest in British soldiers the volume bearing the above title will be read with no little curiosity. It records the experiences and impressions of a gentleman who enlisted as a private in a marching regiment, and, after passing rapidly through the inferior grades, obtained an officer's commission. Those who know little of army matters will find a large amount of information about our soldiers, the details of their daily life, their way of looking at men and things, which is not easily obtainable. Tommy Atkins is not given to keeping a diary, or we might have some queer revelations, for, like the parrot, he "thinks a deal," after his fashion. Officers can have but a superficial knowledge of what passes muster for reflection among the denizens of the barrack-room and canteen. Even those who have risen from the ranks can rarely be accepted as trustworthy exponents of the habits of thought of the class to which they formerly belonged. In our experience, they are almost invariably the advocates of stern dealing towards the soldier, and they are wont to regard him with suspicion. Yet the best officers (of the officer class proper) have, as a rule, found it sound policy to trust largely to the veracity, the honour, and sense of duty of their men; and they have recourse to severity only when milder measures fail of effect.

The meditations of the said Tommy Atkins, so far as we have understood him, are of a peculiar cast; they are certainly not religious, nor are they altogether of a sordid mercenary kind; but they are eminently philosophical, and the philosophy is not speculative, but practical. Making exceptions for the few incorrigible toppers and slovenly ill-conditioned fellows, we affirm that the soldier is a philosopher, and in a certain way he is a gentleman. He does his daily round of duties because he remembers he has taken the shilling, because he knows the duties have to be done, because he sees his officers and sergeants do theirs, because it will be better for him to do them than not to do them, because he knows that after his turn of guard or picket he can have his glass of ale, and can enjoy abundant opportunities of courtship. And that he is a bit of a gentleman he shows by the pride he

takes in looking his best, and doing his best, and in being considered a smart man by the ladies he affects, as well as by his officers.

Some of the statements of the writer must be accepted with caution where he takes us within the veil of the "inner consciousness" of the soldier, and for this reason that his antecedents precluded him from regarding things, even while on equal terms with them, from his comrades' standpoint. As we read we seem to see him continually *trying* to realize what they thought and felt rather than thinking and feeling himself as they naturally did. Credit is given to soldiers as a body in that they do not interfere with or mock at the religious practices of particular men. But the real reason for their abstinence from persecution is most probably this, that to the vast majority religion is a luxury they would rather be without. Soldiers all over the world are unhappily for the most part thoroughgoing materialists. You might with equal justice eulogize them for their parade behaviour as for their religious demeanour when at Divine service. Their conduct on both occasions is regulated by like motives. If anything, it is more uniformly regular and correct while on parade. When a commanding officer sees fit to keep his men out at drill longer than usual, you would never suspect from anything in their attitude that the circumstance is causing them the annoyance it surely does, and that the proceeding will be severely criticized after the "dismiss." But a regiment does not hesitate to let a chaplain know when it has had enough sermon. Very few chaplains can be proof against the shuffling *en masse* of several hundred heavy boots which is sure to take place when the sermonizer has passed certain limits. The writer makes a mistake in saying that a recruit, having on enlistment "made his choice" to which religion he will belong, "he has to stick to it." Soldiers, like other persons, are liable to be overtaken by sudden conversions. As the band accompanies the "Church party," and not the "Catholic party," or the "Chapel (i.e. Wesleyan) party," the first is the most patronized; but, if the church at any station is a long distance from quarters, a change of creed is sometimes found convenient. It may here be stated that the frequently most zealous efforts of the chaplains to do good among the men by going frequently in their midst and making individual friends, are too frequently neutralized by the constant shifting of regiments from one quarter to another.

When a gentleman bred and born, of "quite independent means," fresh from the life of a University, can find so little to complain of in the lot of a regimental private as was the case with this writer, it would seem that the soldier is far better off than most men of his social position. He is required to do one thing—to surrender his freedom—and that not to arbitrary government, but to reasonable control. In return for this, he may rely with certainty on being well clothed, well fed, well educated, well tended in illness, and fairly well paid. In addition to this, through a continuance of good conduct he can better his position very materially. "The food supplied to the soldiers," says the writer, "rather surprised me at first by its goodness. For breakfast as much bread and coffee as could be desired; for dinner a good stew or baked meat, with plenty of potatoes, &c.; and for the evening meal bread and tea. The quality of everything was excellent, and it was only the meat which appeared to me deficient in quantity." Three-quarters of a pound of meat, which is each man's allowance, is certainly but a mouthful for a hungry man, when bone, sinew, and gristle are included in the portion. Actually the meat ration is consumed on an average "in twelve mouthfuls." It is a curious fact that soldiers never drink anything at dinner. "They often get a pint of beer before dinner," but that they consume at the canteen, and "all except the abstainers pay a visit to the canteen directly afterwards, but they have apparently no wish to drink until the eating part of the business is over." There are no keener observers of character and manner than the soldiers of a regiment. "A very ordinary topic among them is that of their officers—almost always respectful in manner. The nicknames most of the officers acquired are rather amusing; and I think it is more frequent to hear their good qualities praised or their peculiarities laughed at, than to hear any blame attached or spiteful language used."

The system of making weekly issues of pay may save all parties a good deal of trouble, but we are convinced that the plan of daily payments is the better one. "Men cannot go as far wrong with 9d. or 10d. as with 5s. or 6s." Some men never seem happy after getting their week's pay till they have got rid of it; and there are certain characters outside the barrack gates who are well aware which days are "pay days," and keep a good look out on those days accordingly. Many, of course, drink their money away; and old soldiers, through much discipline and long habit, contrive to "stow away" an extraordinary amount of liquor, and to preserve withal sufficient steadiness on their legs to allow of their stealing quietly to bed without attracting the sergeant's attention. The latter is often blind of one eye towards this sort of toper, "reserving his notice and authority for the troublesome." Nevertheless, these apparently innocuous men do a great deal of harm among the younger soldiers and recruits, not alone by inciting these to drink, but by the parade they make of unbridled indulgence, coupled with complete immunity from official reproof.

We think it would be a good thing if this volume were published in popular form. Its perusal would help to correct many prevalent delusions as to the condition, manner of life, &c., of the British soldier:—

\* I absolutely deny that there is anything degrading or lowering in the

life and duties of the English soldier. If a man is naturally of a depraved character, he will find opportunities for following his inclinations wherever he may be living. But a steady man can keep as free from lowering habits and bad company in the army as in any other profession. . . . It is not generally known how entirely the distinctly bad characters are left to themselves and avoided by all respectable soldiers, and there is probably no connexion at all between them and their non-commissioned officers except when the latter order them to the guard-room. . . . The next thing which I wish to notice is this; that the life of a sergeant, both as regards his daily duties and daily comforts, is one which any young man of active habits and character who comes from what are termed the working or artisan classes need not despise; and I believe if the true state of the case was more generally known, many men of a better class would make the army their profession. I look back myself with real pleasure to the work and life of a sergeant, and I do not know any occupation or trade pursued by members of the class I allude to that can compare with it. . . . My experience leads me to the firm conviction that it is quite an exception to meet a sergeant who is *bonâ fide* anxious for a commission as a combatant officer. They know that their means would not permit of their living on equal terms with other officers, and that they would be too far removed from their natural life and habits to make such a radical change at all congenial.

We do not know, that, under the present conditions of our social and military system, a gentleman desiring to serve the Queen has much to gain by passing through the ranks to a commission, instead of at once entering upon his natural sphere. The writer had exceptional reasons, inasmuch as he longed to be a soldier and was just too old to get his commission in the natural way; and the ordeal to which he voluntarily, and even enthusiastically, submitted may have been personally beneficial to him. But, while he seems to have done his duty thoroughly, he never was able to feel at home among the privates or even the sergeants. There was always a bar between them and "the recruit with 800l. a year." This recruit had been recommended by distinguished generals to the colonel of the regiment in which he enlisted. The colonel took him by the hand, and promised to look after his interests if he behaved himself; the sergeant-major got wind of this and, as a good diplomatist, was "civil" to the interesting recruit, who, moreover, taught his son arithmetic; the men instinctively recognized a superior being who voluntarily stooped for some occult reason to associate with them, and they did not swear when he told them it was wicked to swear; the sergeants know the gentle recruit was destined to vault over their heads into a seat at the officers' mess, and they seem to have thought it quite in the natural order of things. Altogether we cannot accept the writer as a perfectly legitimate specimen of a man who, unaided, in virtue solely of character and ability, succeeds in gaining a commission from the ranks. Neither is he entitled to speak for the British soldier as one of themselves. He was among them, but not of them. Nevertheless, we commend the volume as the record of an interesting and successful experiment, and as containing much useful information concerning the life and duty of a soldier.

#### THE MAROCCO MISSION.\*

THE State repression of books of travel may perhaps be among the possibilities of the future. The mental disease which seizes upon travellers and impels them to clog the wheels of literature is too trite a subject to require fresh discussion, except in so far as the book before us indicates a new province devastated by the plague. Morocco is the latest addition to the traveller's objects of persecution. We have had several books about it, good and bad, during the last year or two, and now Captain Trotter comes to carry on the attack. Most tourists who scribble books have some excuse or other to offer the public for trespassing on their indulgence; and Captain Trotter, though he does not think it necessary to apologize, has certainly the reason to give for the faith (in his literary deserts) which is in him that his book is the record of a political Mission. The question, however, remains whether the Mission was worth recording. Sir J. Drummond Hay has undoubtedly considerable personal influence in Morocco; and, by persistently hammering on cold iron, it is possible he may eventually effect some improvements in the government of the country and the cultivation of the land. But we are bound to confess that, so far as can be gathered from Captain Trotter's book, the political results of the Mission of 1880 were practically nil. It is true many excellent suggestions were made to the Sultan of Morocco, and many cordial promises of reform were given by his Sherifian Majesty; but it does not appear that matters went much further. Captain Trotter reviewed the royal troops, and pointed out their faults and the remedies thereof in an admirable military report to the Sultan. All his recommendations were cheerfully accepted, and probably as cheerfully forgotten. Two or three little improvements were effected; but there was hardly enough business done to merit a lengthy record such as Captain Trotter has elaborated. The principal results of the Mission, indeed, would seem to have been the frightening of the Sultan with a photographic camera, and the entertainment of the natives by heliographic flashings and the setting up of telephonic communication between different parts of the Sultan's palace. It was, no doubt, an admirable idea of the British Government to introduce scientific novelties into Morocco; but we have grave doubts whether many of the instruments are still in repair.

\* Our Mission to the Court of Morocco in 1880, under Sir John Drummond Hay, K.C.B., Minister Plenipotentiary and Envoy Extraordinary to His Majesty the Sultan. By Philip Durham Trotter, Captain 93rd Highlanders. Illustrated from Photographs by the Hon. D. Lawson. Edinburgh: Douglas. 1881.

There are, however, other reasons for writing a book of travels besides doubtful "political results." Mr. Watson, for example, in his work on "Washan," gave us a graphic description of the country he travelled through, and a very fair impression of the people. Captain Trotter unhappily does neither. He has not the pen of the ready writer; and though he can tell you in respectable mess-room dialect what he sees, he apparently did not see very much. A traveller is nothing if he is not a keen observer. Captain Trotter reminds us, on the contrary, of our old acquaintance "No Eyes." He does not see anything that we care to hear about, and tells us dreary little anecdotes of the trifling incidents of travel, instead of attempting to introduce us to the strange people and country he is visiting. It is true he laboured under great disadvantages. He had no knowledge of Arabic, though he trots out little bits of dragoman's learning here and there, side by side with very well-worn French and Latin quotations; he was tied to a strictly defined route, and could not go exploring as travellers love to do; he had all the Englishman's contempt for the strange animal that he calls the Arab, and did not greatly fatigue himself by the effort to understand him; he had no preparatory knowledge of what to look for, and was ignorant of those elements of Oriental and antiquarian science which are essential to the making of a good observer in Morocco, though he does not spare us that wearisome padding of history, geography, antiquities, and what not, which every traveller thinks it necessary to thrust, head and shoulders, into his unadorned narrative. With such disadvantages it is not surprising that Captain Trotter has made a dull book, and has added almost nothing to the already existing information about Morocco. The twelve botanical species discovered for the first time in Morocco by Miss Hay form the chief scientific gain of the book; but we think Mr. Lawless's photographs, some of which are admirable, should also be reckoned. They, at least, are worth possessing, and what Captain Trotter does not observe the eye of the camera discovers.

Enough has been said to show that the book is not worth any serious study; but as there are people who prefer what are called "books of the season," however trivial and ephemeral, to the hundred great works that gaze reproachfully at them from the top shelves of the library, it may save unnecessary waste of time if we point out two or three passages in "Our Mission" which are better worth reading than the rest. No doubt, on a hot afternoon it is possible to be amused with Captain Trotter's account of the effects produced by the phonograph and other instruments on the natives; of the Sultan's skill in "dodging" the photographer, and his final triumph in sending three fat wives to be "taken" instead of his own august person. The little incidents of the journey, too, may feed the humorous sense of some readers; and the practice of striking the tent over the occupier's head at an early hour of the morning, irrespectively of the stage he may have reached in his dressing, is suggestive of some striking tableaux. But we have these things in all traveller's books, and Captain Trotter is not good at improving on his predecessors. More serious readers may perhaps value his remarks on the social state of Morocco, the position of the women, the slave market, and the Jews. For ourselves we do not attach much importance to these notices, for a month's visit affords little room for observation, and strong prejudices do not conduce to fair judgments. The account of snake-charming in Morocco, though not new, contains some interesting, as well as some sickening, particulars; and the statement of Sir J. D. Hay that a fowl bitten by a snake died within the hour and its flesh turned black, though its bite had no effect upon the charmer, is important. But the best thing in the book is the description of the performance of the Aissowieh dervishes. The sect is held in the highest reverence in Morocco, and "the inhabitants vie with one another in ministering to its wants"; but the rites are so ecstatic and savage that it is dangerous for a Christian to witness them. It was by a misconception of a request of Sir John Hay's that the Sultan ordered a performance of the Aissowieh for the gratification of the English Mission; but the spectacle was worth seeing, though not desired.

These, then, were the crowd of people who, having hitherto been kept in the background, were now brought forward by their Emkaddemin, or high priests—three old men of great height and commanding appearance, with dark flowing robes and long white beards. At first they were formed up in double rows, facing each other, with the Emkaddemin between them, and began their dance to a monotonous tune kept up on drums and horns. Gradually they kept working towards our tent, stamping their feet to the time of the drums, and throwing their heads backwards and forwards with a corresponding and rapidly increasing motion. . . . The Aissowieh . . . were now reduced to about twenty, those to whom the spirit had not communicated this state of religious ecstasy having had the good taste to withdraw from their more favoured brethren. Those who remained presented a horrid appearance; their clothes hung loosely upon them; in most cases their turbans had fallen off, exposing sometimes a bare and shiny skull, sometimes long dishevelled hair, which, by the constant motion of their heads, now hung in clusters down their backs, now in matted locks concealing their faces. Occasionally three or four would break away from the ring and indulge in a *pas seul* outside it, or else run full tilt with their heads against a tree, and beat the stem with their hands till the blood flowed freely down. The eyes of all of them had now become fixed and glassy, their tongues lolled out of their mouths, and their faces assumed a livid hue, while from the entire circle rose the ceaseless cry of "Allah! Allah! Allah!" . . . The chief method observable in their madness was that they seldom did each other any injury, though occasionally one or two at a time would fall on their faces and commence tearing up the grass, which, with handfuls of mud, they would force down their throats, and digest with apparent satisfaction. On these occasions, if two of them came in contact, one would seize the leg or head of the other, and commence gnawing it in an abstracted manner, inflicting horrible wounds, to which operation his fellow-enthusiast would make no objection. The Emkaddemin would now interfere, and by kneeling on their heads and

other gentle measures quiet them; then by some mysterious exorcism they would recall the men to reason, keeping their eye on them till they sheepishly left the spot and got away behind the spectators. By this means all but four of the Aissowieh were disposed of; those that were left, however, seemed beyond even the influence of their priests, who would occasionally make an attempt to subdue them; but, failing to do so, contented themselves with closely watching, and, when necessary, placing themselves between us and the wretched men, who now looked more like beasts than human beings. In fact, through some freak of their disordered brains, these men had assumed the rôle of wild animals, and were prowling about on all fours, uttering unearthly cries, like hungry beasts in quest of prey. . . . Among our servants were several followers of the sect, who, forbidden to join in the saturnalia, had been looking with sympathetic eyes at their coreligionists. One young boy, however, of about twelve, also an Aissowieh, who has lately been taken into the service of the Khalifa, not being able to resist the fascination of the scene, joined in it, and, having given himself over wholly to the Evil One, was now lying in a state of exhaustion on the ground, his stomach full of mud and grass, and his nice new clothes, provided by an indulgent master, reduced to rags. Towards young Hasan, for so is the youth called, one of the priests now moved, and, taking him up by the waist, threw him as a bait to allure away the fanatics from us. The device succeeded better than we had hoped for; and, with a horrid roar, they threw themselves upon the boy. He remained where he had been thrown, without moving or uttering a sound; and, while the horrid crew were howling and struggling over the mouse before proceeding to tear it to pieces, he sprang from among them into the arms of the nearest Emkaddemin, who, secreting him in his ample robes, moved away from the spot. The vacant despair and then rage of the Aissowieh, when they saw their victim was gone, was indescribable; they tore up the ground with their nails and teeth, and then separating, apparently in search of their prey, were set on by their leaders, who by moral suasion and by physical force, requisitioned from their now sobriety followers, removed the still raving madmen from the scene (pp. 199-202).

One other point requires notice in *Our Mission to the Court of Morocco*. In pp. 80-82 Captain Trotter relates a very remarkable career of a "foreign official," who would seem to have extorted money from the people on false pretences, and marked every pause in his journey by oppression and lies and every species of extortion. Some of the natives seem to have suffered imprisonment, stripes, and even death, through his agency. The story is so circumstantial that it is difficult to doubt its accuracy; but, if it is true, it is surely a public duty to give the name of the "foreign official." He has befouled the good name of Europeans in Morocco, and, if Captain Trotter knows his name and nation, he is surely needlessly merciful in concealing them.

#### ON A RAFT AND THROUGH THE DESERT.\*

IT is no rare thing in these days that an author should seek to emulate the fame of Howick, and both write his book and also supply the illustrations. As a rule, illustrations, especially to books of travel, are merely drawn by the author and transferred from the sketch-book to wood. In one or two recent examples this process has ended in signal failure. We need but remember the exquisite drawings of Lady Anne Blunt in the Grosvenor Gallery last year and the absurd caricatures of them which the English wood engraver produced in the book. In America they do these things better; but wood engraving is rapidly becoming a lost art among us, and even cuts only fit to head a street ballad are so expensive as to be out of the reach of ordinary authors. Mr. Ellis has done wisely in discarding woodcuts altogether. It is a question whether a few of those charming facsimile sketches which illustrate Gallery catalogues, and notably the catalogue of Mr. Ellis's own pictures in Bond Street, might not have produced a pleasing effect in the text. But in Mr. Ellis's very modest preface he makes no mention of such a possibility, and merely says that he adopts etching on copper, "the most artistic form of illustration, because it is the work of the artist himself." This reason would apply equally well to several of the so-called "typo-etching" processes; and we are not quite sure that the peculiar character of Mr. Ellis's work would not have come out equally well, and less expensively, in many cases, without all the trouble involved in biting and polishing and inking and wiping copper plates. No doubt when, as in the volumes before us, a limited number of beautiful prints is produced, the result is eminently satisfactory. Still, we repeat, there is unnecessary labour and expense involved in it. It is impossible to print rapidly from etched copper-plates, and the very first picture in the book, the frontispiece to volume i., beautiful as it is in many respects, is certainly too dark, at least in the copy before us. Still, as Mr. Ellis says, it is the artist's own work, and conveys an impression of truthfulness which no imitation at second-hand, however carefully executed, could convey. Of some of these etchings we can hardly speak too highly. The second print in this same first volume is full of poetry, and, at the same time, as any one who visited Alexandria before the removal of Cleopatra's needles can testify, absolutely truthful. The effect of sunset is given by the simplest means. A few lines only go to make the sky, yet it seems to be full of glowing colour. Behind the doomed obelisk the city stretches out into the sea, and the famous Pharos appears on the extreme point to the right. Another very effective picture is entitled "Bir Edjik," but appears to represent a ford of the Euphrates, more correctly spelt in the text as Bir Edjek. In the foreground are some camels and their drivers seated by the water's edge, waiting for a ferry. In the background,

\* *On a Raft and Through the Desert*. By Tristram J. Ellis. 2 vols. Illustrated by 38 Etchings by the Author. London: Field & Tuer and Hamilton & Adams.

against a sunset sky dark with heavy clouds is the great grey castle—"one of a similar set of castles reaching right down the Euphrates to Babylon." Lovers of the *Arabian Nights* will be disappointed with the mean appearance in these views of such world-famed, romance-coloured cities as Mosul, of which there are two etchings, the first very fine, with one of Mr. Ellis's favourite sunsets, and Baghdad and the Midan and Kathimain, even with its golden domes. But Mr. Ellis's work inspires us with a feeling of confidence, and it is but too clear that the glories of Mesopotamia are among the things that have passed away.

The figure subjects are quite as varied as the views, and differ also as much in merit. Some do not satisfy the requirements of representing the brilliant light of the East; and others do not form pleasing pictures, however faithful they may be to nature. "Baghdadia" represents a lady in a garden, trying the fruit of a dwarf orange tree. Her head is covered by a fez ornamented with coins. She wears a long robe with wide sleeves, very open in front, but with no belt or waistband, and over it a kind of cloak. With these simple materials Mr. Ellis has just failed, but failed by very little, to produce a pleasing effect. The dress is too stiff. Perhaps it was as stiff or stiffer in the original. The eyes and eyelashes are too black—perhaps they were artificially coloured in the lady's own face. Mr. Ellis has, perhaps, sacrificed beauty to extreme accuracy. But to another print none of these criticisms apply. "The evil-eyed old Monsour" sits on his camel and looks from under the heavy shadow of his hood straight out of the picture. There is something very uncanny in his face, which is well contrasted with the equally uncanny face of his camel. This is a clever etching, full of careful drawing, depth, and expression, as well as fidelity to the subject. No one who has not tried knows how difficult it is to draw a camel correctly. Among those of our artists who habitually draw their inspirations from Oriental sources, there are very few whose representations of camels are not ludicrous to any one who has specially studied the ungainly features of that ill-tempered, untamable, growling savage. There was in the late exhibition of the Royal Academy a painting in which a Bedawin was riding on a camel, but it was a soft-furred, rich-coloured, drawing-room kind of beast, neither naked, nor mangy, nor prognathous, nor clipped, nor in fact a bit more like the ordinary camel of commerce than a racing colt, fresh from the trainer's stable, is like a cab horse after years on the London pavements. Mr. Ellis's camels are true to camel nature. Nobody ever saw two camels alike in face, except so far as all camels' faces express extreme disgust and ill humour. Mr. Ellis has varied his sketches accordingly. In the night scene which forms the frontispiece to the second volume are five camels, which leave nothing to be desired in point of drawing and arrangement. Of other figure scenes perhaps the most pleasing show: "Christians at the Church Door, Aleppo," in which a negress dressed in black is finely contrasted with a gracefully-attired damsel in white, while a truculent-looking Syrian, in the costume familiar to employers of dragomans, stands in the paved courtyard beyond. "In the Bazaar, Mosul," is another very pleasing print, the figures graceful, the faces pretty, and with not too much of that attempt to give exact details of costume which often makes travellers' sketch-books into mere collections of fashions.

Mr. Ellis undertook his journey in the first instance with an artist's intention to make drawings and collect materials for pictures. He hopes, he pleads modestly, "that having gone beyond his profession in writing the text of the book, the same generosity will be extended to him as to the army veteran, who, though a man of action and not of words, sometimes finds himself by the force of circumstances in the position of an orator." This indulgence may be the more readily accorded to him because he has neither, on the one hand, attempted fine writing, nor has he, on the other, failed to express what he wished to say in simple and forcible language. His journey is described on an unusually full title-page as having been made through Northern Syria and Kurdistan, and by the Tigris to Mosul and Baghdad; he returned across the desert by the Euphrates and Palmyra to Damascus, over the Anti-Lebanon to Baulbek and to Beyrout. No element of the picturesque was thus wanting in his route, to which additional interest of a painful character was given by the incidence of one of those famines which at short intervals devastate the outlying provinces of Turkey, famines which in nine cases out of ten have their origin in the organized system of robbery which the Turks call finance. After some preliminary excursions from Beyrout, in one of which he visited Sidon, he set out from Iscanderoun about the middle of February 1880, and passing through Aleppo, reached the bank of the Euphrates at Bir Edjek, and that of the Tigris at Diarbekir. Purposing to drop down the stream on a raft from Diarbekir, he was delayed a considerable time by rumours of robbers, who were really only unfortunate inhabitants driven by famine to plunder passing rafts for grain. The Government could not, of course, being Turkish, do much to relieve the people's hunger, but they could and did send soldiers to quell the rising, and on the 18th March, the river being declared free, Mr. Ellis set sail. A Tigris raft, he tells us, "consists of a framework of wood, supported on inflated goat-skins." It is constructed by lashing long straight boughs of poplar together so as to form "a grill with bars eight inches apart, of the full size of the raft." The method of inflating the skins, of tying them under the grill, and of mending them is fully described, and the further process of superimposing a second grill and a flooring of osier sticks. On this flooring Mr. Ellis made him-

self a house, furnished with a stove and other civilized appliances. The osier flooring seems to have been the worst thing about the raft, for it was "very difficult to walk on, as, unless one is very careful, a foot will slip through on to the skins. These give way on each side, and one's leg is in the water in a second. The skins immediately close round the ankle, and it requires the assistance of others to haul one's foot out." On this frail structure, swirling round in eddies, stranding in the shallows, bumping on rocks, the skins, to the number of half a dozen at a time, "going off with a sudden and discomfiting pop," Mr. Ellis remained till the raft, passing out of Kurdistan, entered Mesopotamia, and finally, leaving on the left bank Koyounjik, the ruins of the great Ninevite palace, was tied up at Mosul. Here he found an English lady and gentleman directing the distribution of soup to a crowd of poor people. "The English cheerfulness, mingled with hard work efficiently done, side by side with all the squalor and mismanagement, suddenly coming upon one, made an impression I can never forget."

Mr. Ellis did not desert his raft until he reached Baghdad, and commenced his return journey "Through the Desert," the narrative of which occupies his second volume. The book is full of adventures pleasantly told, and is valuable for its clear descriptions of landscape and buildings. Mr. Ellis's previous training as an engineer enabled him to see things correctly, and his letter-press as well as his sketches is trustworthy accordingly. This is particularly the case where he tells us of the wonders of Palmyra and Baulbek, both of which he visited before he returned to Beyrout, whence he embarked for home at the end of June. His volumes are furnished with an excellent map and a sufficient index. They are beautifully printed in the clearest of type. The white binding has but one fault, that its beauty is too evanescent. Altogether it may safely be asserted that even a reviewer takes leave of such charming volumes with regret.

#### KING LAZARUS.\*

MR. LEITH DERWENT has given us a story that is remarkably full of words. We suppose that, if they were counted, it would not, indeed, be found that there are more words in these three volumes than in any other of the same size. And yet though this, we suppose, is a fact, yet we find it very hard to convince ourselves of its truth. As we closed the third volume, we felt as if we had been pelted with words just as at the Carnival we have been pelted with handfuls of rubbish so fashioned as to look like sweetmeats. Then, changing the comparison, it seemed to us as if we had escaped from a deluge that had almost taken away our breath, and even our senses as it beat upon us hour after hour. We had, indeed, managed at last to reach dry land, and to find a place of safety from its pitiless flood, but the storm had been almost too much for us, and we were little fit, we soon discovered, to give any clear account of what had befallen us. Yet we must gather such wits as we have left, and let our readers know all that we can tell them of this dreadful storm. Should our author go on writing we trust that he will stop short with his ninth story. Let him not come down upon us with all the onset of the tenth wave, or he will sweep us clean away.

*Vastius insurgens decime ruit impetus undæ.*

As it is, even his second wave—for this, we believe, is only the second time that he has written—has been almost too much for us, and has left us nigh spent with a strange kind of ringing in our ears. However, let us not complain. We, at all events, are through the flood, and may hang up our votive garments to the deity that has saved us. If others choose to follow us, and get hopelessly swamped in the passage, they will have only themselves to blame.

*King Lazarus* is, of course, not only words. It is, indeed, crammed as full of rant as any three volumes can well be; and yet, in the midst of this rant, room has been found, not only for heroes and heroines, love-making, and dying, but even for Mr. Bradlaugh, M. Thiers, Marshal Bazaine, M. Gambetta, the leaders among the Communists, and the Franco-German war. As for poor Nature, she is scarcely left for even one moment in peace. She is always being dragged on to the stage, decked in the most brilliant tinsel. The sun and moon have a sad time of it, and cannot be allowed to rise and set, and get done with it once for all. The heroes skip backwards and forwards with startling rapidity from Wastwater, in the Lake country, to London, to Paris, and to the South of France. The sun and the moon unfortunately they can never leave behind them. The reader, so far as we can remember, is rarely so happy as to catch the chief characters on an evening when the moon was not shining. In the opening of the first volume we have the sad wan face of the goddess Luna and its melancholy beauty. We are taken to London, and there we find her sheeting the hero's bed with silver. A page or two further on the moon seems, we are told, to be looking so wearily at him, and next it peers out from the clouds with a wild and frightened glance. Later on it looks with a wan, strange face into decaying châteaux. The sun does not come far behind. It is a sign of splendour and an eye of fire. When it sets it flames as the rage of war. It shines on what the author calls breakfast equipage, and on some primroses that were in the midst of the equipage, and it lingers to set off to the best advantage their paly gold. At one

\* *King Lazarus*. A Novel. By Leith Derwent, Author of "Our Lady of Tears." 3 vols. London: Richard Bentley & Son. 1881.

time it sparkles among the shining wealth of the hair of one of the heroines, at another time it kisses a ripple of golden hair that waved near some dark green box-trees. In a third passage we read that her eyes, of a blue between sky and violet, shone out melting and tender from beneath a shining of sun-kissed hair. Again, we find the sun kissing the sea, while the waves entreated the eye to drink for a moment of the foaming light of their translucent green. The following passage is a fair specimen of the author's style when he is describing nature:—

The fairest of May was smiling upon France. On battle-fields that last year's rain of blood had fertilized, the green promise of harvest covered the soil from which dead faces had looked up piteously to heaven; and the beneficent goddess, kindest Ceres, moved in bounty across the land that war had desolated, hiding with vine-leaf and corn-stalk the broad track of ruin that had been left where German feet had marched on Paris. As fair of face as in the days when she was Queen of Nations, France hid the fetters that the Teuton had clasped on her wrists, and the culture of civil war that tore her bosom, beneath a robe of green and wreaths of flowers. It was one of the brightest days of early May, and Nature had still the freshness of spring, but was all glowing and flushed with the approach of summer; and the sky above was unclouded, and the earth all sunny and smiling.

As this description does not end here, but goes on with the shining sky, the infinite azure, the mighty vault and the empyrean of fancy, we might very reasonably have hoped that of the month of May, at all events, we had seen the last. But what is May in France is May also in England; and so in the next chapter we have the dreamlike loveliness of the scenery provided by nature in Devonshire in that month described at greater length than we care for. From Devonshire we return to France, and the tiresome month is not over yet. We have the sunshine of one of the sweetest mornings ever born to May lighting up a hospital with its golden glory, and shining on cattle grazing and labourers singing. In Paris, however, its brightness seemed to grow faint and tarnished, and to change its sweet splendour for a sickly and lurid glare. Even with this description the author is not satisfied. He comes back nearly a hundred pages further on to worry the unfortunate month once more, just as a cat will return to worry a mouse. At last we take leave of May, as "the stars paled steadily out of heaven, and the rising sun first lit up with a herald redness the sky of the east, and then burned up resplendently above the horizon, and flung wide over Paris a rain of light." The reader, who is thankful for the very smallest of mercies, is only too glad to find that by the time it became needful to describe the weather in Wastdale it was on a fresh morning of early June. So pleased, indeed, is he to have escaped from May that he can almost forgive the sun for shining tenderly; nay, he can very nearly command his temper when he reads that where there were roses there fell tender on their lips the kisses of June.

It is not by any means to descriptions of nature that our author's big words are confined. On the contrary, his style is, as it were, always on the strut, and is a kind of crow from first to last. The strut is most on tip-toe, the crow is at its shrillest in those passages where one of the heroes keeps a diary. By the way, this diary-keeping in our heroes and heroines is becoming a nuisance as great as it is common. The practice has spread with great rapidity, and ought to be at once sternly checked. Even a modern novelist has sometimes a suspicion that his finest writing is all nonsense. When such is the case he hopes to lighten himself of some share of the responsibility, and yet to retain all the credit should it, after all, turn out that his suspicions were unfounded, by bringing a poet into his story, and by making him now and then keep a diary. If what is written in it is a mere rhapsody, it can be pleaded that it is, if incoherent, nevertheless in keeping with the character. If, on the contrary, it is inspired, then the author justly puts himself forward as the sole source of the inspiration. In the present case the very first sentence of the diary or journal threw us into a cold perspiration. It came quite early in the first volume, and we could not tell how much there was to follow. "Something in me," records the poetical hero, "seems to have snapt, some harp-string of the brain from which invisible fingers were wont, long ago, to draw subtle music." We pass on to the face of the seraph, Genius, and the glorious way in which, according to this young prig, she had shone on him when he was a mere boy. By this time he was, if we remember rightly, about two-and-twenty. He writes an account of the first French Revolution, full of such passages as the following:—

Not Phosphor, but that Wormwood Star, the light of which fills earth with bitterness, was it that had risen in the firmament; its rays were not the promise of a dayspring of universal liberty, but of night, a night lurid and terrible, when Europe was shaken with the tread of armies, and there trampled upon her prostrate kings a figure as of incarnate War, diademed with an imperial crown, and named of men Napoleon.

He laments at one time that, instead of having won for himself a name in literature, he was but an usher in a school. He might surely, as he wrote such high-flown nonsense, have with much more reason rejoiced that he held in his own hand the rod which his back so well deserved. If, he had known his Boswell, he might with advantage have called to mind the passage in which Johnson is described as saying, "This now is such stuff as I used to talk to my mother, when I first began to think myself a clever fellow; and she ought to have whipt me for it." The usher's head-master, who is represented as a scholar, uses, by the way, the somewhat unusual construction of *vae civitate* (sic). It scarcely seems more accurate than the author's French, of which *ambition démesurée* is a specimen. In one of his most high-flown passages the poetical journal-keeper falls

into even a worse blunder. He writes how "Mr. Thomas Gray has sung to us with no little sweetness and pathos of certain Berkshire careers that jolted and rumbled along the way of life as heavily and uneventfully as one of the village waggons along the London high-road." How a career can jolt and rumble along a way we did not stop to inquire, so pleased were we to find that Mr. Thomas Gray is allowed to have some merit, and is even kindly enough patted on the back by one of the modern school of poets. About Berkshire, nevertheless, we were a good deal perplexed. What had Gray to do with Berkshire, we began to ask of ourselves? Not hitting on an answer, we read on. We came to a sleepy monotone, and the peace of Morpheus, and at last we arrived at "the intrusion of that mendacious and altogether misplaced hypothesis concerning the dust-choked lips of nameless and tuneless Miltons, the idly withered lives of Cromwells . . . genius, the undeveloped genius of some never to be crowned king of men, clayed up in a Berkshire churchyard!" The writer, it was clear, was ranting about the *Elegy in a Country Churchyard*, and was in the belief that Stoke Poges is in Berkshire. It is really too bad of him to fall into such a blunder in geography, for it leads him into abusing Berkshire and her "acred dulness." Now we can assure him that, even in the flattest parts of that county, along the dustiest of her roads, there is no such stretch of dreariness as we have encountered in his journal and in the three volumes of the novel of which he is the chief hero. As for the downs and heathlands of Berkshire, they can take care of themselves. Their wild beauty needs no defence against writers who, ill as they treat common-sense, treat nature, if that were possible, almost worse.

#### MINOR NOTICES.

PROFESSOR MAYOR has expanded a part of his introduction to the *De Naturâ Deorum* into a handbook of Ancient Philosophy (1). He has, he tells us in his preface, been mainly moved to do so by recollections of the days of his own studentship, when he had to attack the subject with no better help than Schleiermacher, whom he could not understand, and Lewes, who kept insisting that philosophy was all vanity and vexation of spirit. Works on the history of philosophy have since appeared which are neither unintelligible nor flippant, but "they are too long, too full, too hard, too abstract, or too vague for a first sketch. What is wanted is something to combine conciseness with accuracy and clearness, something which will be easy and interesting to readers of ordinary intelligence, and will leave no doubt in their minds as to the author's meaning." We are afraid that, when translated into plain words, this means cram, and people who do not approve of that form of education will not thank Professor Mayor for the lift he gives it. The object of setting students to study philosophy is as much to train them by the struggle with difficulties as to give knowledge; and when half the difficulty is removed by neat summaries, the value of the study is proportionately diminished. The reader of ordinary intelligence who prefers many things to philosophy will probably not trouble Professor Mayor's book. The indolent student who wants to be ready with an available stock of knowledge against next examination day will find that it largely saves him the trouble of thinking. He will be further grateful for the service that it is rendered in a pleasant readable style. He must be a very dull fellow if he cannot pick a handy general knowledge of Aristotle (whatever that may be worth) out of the fifty pages Professor Mayor devotes to that philosopher.

The anonymous author of the little treatise on *The Papal Claims* (2), introduced to the public by the Bishop Suffragan of Bedford, claims to treat his subject "with care and candour," and with a commendable desire to avoid "offering what might be regarded as insults to another communion or to its members." To all the praise which can be given for courteous and temperate language the writer of *The Papal Claims* is fully entitled. But we doubt whether much more is to be said in praise of his book. He repeats the already well-known arguments against what are rather vaguely termed the Papal Claims with no originality as to matter and little skill in arrangement. His book is primarily intended for persons wavering as to whether they shall or shall not go over from the Church of England to the Church of Rome, but the form of his argument is not very happy. He keeps on insisting that it is not enough for them to hold the Church of Rome to be better than their own. They must be sure it is all it claims to be. This may be very sound logic, but it does not strike us as the kind of argument likely to affect people in the state of mental exaltation which precedes a conversion and a violent separation from the associations of a lifetime. The style of the book is very dry, and at times inaccurate. The printer is probably partly responsible for the statement that "the condition of the Roman Church at that particular time (i.e. the eighteenth century) was no better, nor, indeed, one might almost say, of any other Church," but the writer must have helped him. There are many other sentences nearly as confused. *The Papal Claims* is the kind of book which will only be read by those who already thoroughly agree with the author.

Lieutenant Robertson has put on the cover of his book a some-

(1) *A Sketch of Ancient Philosophy, from Thales to Cicero*. By Joseph B. Mayor, M.A. Cambridge: University Press. 1881.

(2) *The Papal Claims, considered in the Light of Scripture and History*. London: Wells Gardner, Darton, & Co.

what too ambitious title. *Three Campaigns in Afghanistan* (3) suggests a regular military history, or an attempt at one, but what he has written is accurately described in the more modest words of the title-page as "a brief record of impressions" during parts of the late operations round or against Kurum, Kabul, and Kandahar. The writer had the misfortune to be told off for the tedious work of guarding the communications or bringing up supplies, while some of the most stirring events of the war in Afghanistan were being transacted. He was left behind during the first advance after the fight, such as it was, at the Peiwar Kotal, and he missed General Roberts's march to Kabul after the murder of Cavagnari and his suite. But he saw the subsequent operations round Kabul and shared in the march to Kandahar. With all that he missed, enough came in his way to have made a much more interesting book than he has written. He has, we should judge, been in much too great a hurry to get his impressions printed and off his hands. As a natural consequence they want colour and individuality. Perhaps, too, he has not been sufficiently clear as to what sort of book he intended to make, and has fallen to the ground between a purely critical military treatise and a narrative of personal adventure. His account of the most remarkable feat of war of all, the march to put right the state of affairs at Kandahar after Maiwand—about which Lieutenant Robertson has some very sensible things to say—is so general in its descriptions, that any man with a lively imagination and the competent military reading could have given as good an account without having been there. What he has described would apply to any rapid march in a dry country. Making due allowance for what he has not done, Lieutenant Robertson has produced a fairly readable book, which impresses us as the work of a sensible man of more than ordinary reading and some faculty for writing. If Lieutenant Robertson ever has any more personal impressions of war to impart, we hope he will make them fuller, and will contrive to avoid the besetting sin of the writers of "personal impressions"—a vein of small jocularity—more completely than he has done here.

Mr. Cornish's contribution to the series of "Historical Biographies" (4) is just such an account of Cromwell's life as any man of ordinary intelligence who chose to devote a little pains to it could compile out of Carlyle's "Letters and Speeches," with occasional help from Macaulay, Clarendon, and a few well-known memoirs. It is a readable narrative, which would be useful to a boy at school who had no previous knowledge of the Protector's life, but only as giving the facts in a convenient way. No credible account of what kind of man Cromwell was need be looked for from Mr. Cornish. Mr. Carlyle's great work has made it impossible for the author of this biography as for other people to accept any longer the "hypocrite and fanatic" theory; but it is plain that he finds it very hard to reconcile Cromwell's actions with the possession of common honesty. "He," says Mr. Cornish, "is commonly described as a mixture of fanatic and hypocrite. If we say that he was a man of earnest religious convictions, and of deep and crafty policy, justified by self-deceit, we shall more truly express what is meant." Now, apart from Mr. Cornish's mistake in fact—for no writer of any standing for the last half-century has thought of describing Cromwell as a mixture of fanatic and hypocrite—his two sentences are a curious example of the perils which beset the biographer who tries analysis of character without clear ideas as to the meaning of words. His second sentence is a mere re-statement, in a slightly different form, of the ally description in the first. In another place, and in more than one, Mr. Cornish insists that Cromwell, though doubtless an honest man, never could do things in a plain, straightforward way. This, to quote a writer much used by Mr. Cornish, "may be credible to scrubby apprentices of tender years," but to us it seems very like a contradiction in terms. Cromwell was not a pedant, dreaming about ideal States with his elbow on his desk, but a leader in a revolution who had no choice but to work with the tools he found to his hand. To accuse him of being crafty and so forth because he did not choose to risk everything by rushing at insurmountable obstacles, is like accusing a general of being a cheat because he prefers to attack his enemy by the flank instead of in front. Mr. Cornish indulges in a great deal of reflection on the perverseness of everybody who would not keep the straight path. This shows an amiable frame of mind, but it is not the way to teach boys how to get an intelligent knowledge of history. For the rest, Mr. Cornish's narrative is clear, his battles are well illustrated by maps and intelligible. We can particularly recommend his account of Marston Moor as likely to preserve his readers from being misled by much nonsense ordinarily talked about it.

We have lately had occasion to notice some charming little reprints issued by Messrs. Pickering. Another of the series is now before us (5). Of the author little or nothing is known, except that he was in holy orders. Mr. Loftie has gathered in a short preface probably all that can now be recovered regarding him. His "Resolved Meditations" are full of the quaintness characteristic of the age of Euphues, yet his language is that of the best of his contemporaries, "among whom may be reckoned some of the greatest writers England has produced." As a collection of religious thoughts, yet not wholly devotional, "Spare Minutes" is worthy of its place among the well-selected books of this series.

(3) *Three Campaigns in Afghanistan*. By C. G. Robertson, Lieutenant 8th (The King's) Regiment. Edinburgh: David Douglas. 1881.

(4) *Life of Oliver Cromwell*. By F. W. Cornish, M.A. London: Rivingtons. 1882.

(5) *The Spare Minutes; or, Resolved Meditations and Premeditated Resolutions of Arthur Warwick*. First Printed in 1632, and Enlarged in the following year.

"Nothing is more common nowadays than to hear of the degeneracy of poetry, and the little appreciation bestowed by the public on the lucubrations of our modern bards. And the cry is, generally speaking, well founded. That much of the poetry which is daily poured from the press creates little sympathy is nothing very extraordinary, the apathy is traceable to a very simple cause—the over-supply of an inferior article." With these profound observations Mr. Ross begins an essay on "Hood's poems" (6), and we think it a great pity that he did not pause over them to consider whether as much might not be said about the writers of essays. There is, we can assure him, not only an over-supply, but a glut of inferior articles of that kind. However, as Mr. Ross is assured that "already in fragmentary periodicals and newspapers they (his essays, to wit) have given pleasure to not a few sensible and honest folk," we must suppose that he knows his public. Perhaps the sensible and honest folk of Scotland who read fragmentary periodicals like to find there commonplaces about nothing in particular, flavoured with the innocent humour of the tea-table in the style of an average school essay. They will enjoy being told that Voltaire's "character and principles as a moral being will ever meet the righteous condemnation of all well-constituted minds"; and when Mr. Ross informs them that *La Pucelle* was "produced" about the time that its author was stopped by Friedrich's agents at Frankfort, they will not see that anything is wrong.

In his "Introduction" Dr. Gatty gives an account of the origin of his key to the *In Memoriam* (7), which places his motive in writing it beyond criticism. He says:—"The following notes will testify that since my home was darkened by death, the poem has been a sublime resource and consolation." His Key is meant to be a work of piety and gratitude, and as such is, as we have said, beyond criticism. The value of his work for others will, we imagine, be very small. His Key, apart from explanations of references made by the poet, is little more than a prose paraphrase of the poem.

Mr. John Noble has collected and republished the poems of Thomas Pringle (8), with the view of reviving an interest in them, and of meeting the oft-expressed desire of South African colonists for a collection of Pringle's "South African Poems." Whatever their popularity may be in South Africa, where the uncouth words of which they are full are familiar, we doubt whether their republication will produce any revival of interest in them in England. They had their time of popularity when Pringle's anti-slavery and other commonplaces, versified with more than average skill, were new. The commonplaces of the religious world are changed now, and it has new Pringles. By far the most interesting parts of the book are Mr. Noble's "Memoir of Pringle" and the notes to the poems. Mr. Noble's story gives us a respect for the manly, upright character of the poet, and the notes contain much interesting matter about the early days of our rule in South Africa.

Mr. Tomlinson (9), who takes as his motto Béranger's words, "Mon cœur est un luth suspendu, Sitôt qu'on le touche il résonne," has published a small collection of poems which show that he has read a little of Mr. Swinburne, a little less of Mr. Rossetti, and can put commonplace into verse as well as many other hopeful young men.

Miss Mathilde Blind (10) has fulfilled the duty of all well-regulated young persons of literary ambition and published a collection of verse. The smaller ones are devoted, with a loyal regard for tradition, to subjects which are all recognized as the proper commonplaces. The longest of all, which gives its name to the book, is named after St. Oran, apparently the patron saint of minor poets, for it is not written, "Earth, earth on the mouth of Oran, that he may blab no more."

Miss—we think we are safe in saying Miss—E. Fairfax Byrne (11) has produced a poem which, we are sorry to say, is a mistake. We are sorry, because the book shows some power of writing melodious blank verse; and among the characters of the poem one, the heroine's, has considerable sweetness and dignity. But it was not the less a mistake to write it in blank verse, for essentially it is a ladies' novel, with the ordinary faults and the merits of its class.

A prose idyl, which is what Miss Vere Huntly calls her story (12), would appear to be the new name for a very old friend—the ordinary love story written by women who are utterly incapable of drawing the character of a man, and will try to describe society which they know nothing about.

If anybody desires to know what our old acquaintance the fashionable novel looks like when it is transplanted to America, we can recommend him or her to read *The Confessions of a Frivolous Girl* (13). It has not been improved by the process.

(6) *Waifs: a Handful of Essays and Sketches*. By W. T. Ross. Glasgow: James Maclehose. 1881.

(7) *A Key to Tennyson's "In Memoriam"*. By Alfred Gatty, D.D. London: David Bogue. 1881.

(8) *Asur in the Desert and other South African Poems*. By Thomas Pringle. Edited by John Noble. London: Longmans & Co.

(9) *First Fruits*. By W. W. Tomlinson. Newcastle-upon-Tyne. 1881.

(10) *The Prophecy of St. Oran, and other Poems*. By M. Blind. London: Newman & Co.

(11) *Milcent: a Poem*. By E. Fairfax Byrne. London: C. Kegan Paul & Co. 1881.

(12) *King o' Men. A Prose Idyl*. 1 vol. By Vere Huntly. London: Remington & Co. 1881.

(13) *The Confessions of a Frivolous Girl*. Edited by Robert Grant. London: Sampson Low & Co. 1881.

Miss Mary Caumont's little collection of stories for children (14) is neither better nor worse than hundreds of such books.

A new edition of the well-known and popular *Old Oscar* (15), with illustrations by well-known artists, needs no recommendation now.

Mr. Lloyd, who has visited Pontresina every season for eight years past, has spent his time in making a complete study of the country, and publishes the knowledge he has collected in a neat little volume full of facts and well illustrated by maps (16).

Dr. Alfred Wise has published an account of DAVOS PLATZ (17) from another point of view—as a health resort; and, as far as we can see, he has collected all the information invalids need in a small space and a convenient form.

Mr. A. Mayhew has written one of those handbooks so common at this season, and meant to prove that some one particular spot in England is an earthly paradise of beauty, cheapness, and health. His particular happy valley is Birchington-on-Sea (18), and we dare say it deserves the praise he gives it quite as much as other writers' happy valleys do.

Mr. S. Jennings, who, as Secretary to the South Indian Gold Mining Company and another similar undertaking, is an obviously impartial witness, has written to assure the public that the South-East Wynaad is full of gold, and will surely make the fortunes of everybody who has the intelligence to work it (19). His hopeful view of the subject is presented to the public well printed, well illustrated, and bound in an equally appropriate and splendid gold cover.

The "Foreign Countries" Series (20) falls into the same mistake as many of its fellow popular series, and gives the same amount of space to each of its subjects, without much regard to their relative importance. Though the last published, that on France is not large enough for its subject; too much of it is taken up in mere talk about the country, and useful information is sacrificed to that.

It is worthy of notice as a sign of the times that such a production as Mr. Macfie's *Cries in a Crisis* (21) should reach a second edition, and that, too, in an enlarged form.

The supply of handbooks to show mankind how to do everything that man can need to do is extraordinarily abundant at this time. Two persons of the name of Jerrold (Tom and Jane) have published a nicely got up work on Household Horticulture (22).

A plainer work, of greater usefulness, is published by Messrs. Ward, Lock, and Co. (23)

The same firm have also added another to the hundreds of books on cookery (24) which are intended to teach what cannot possibly be learnt from a book.

To this class of work belongs Mr. S. H. Jeyes's "Guide to Studying for Classical Scholarships" (25).

Mr. Smith's Grammar (26) is a useful school book and a work of altogether higher character than these.

By his translation of Hartman (27) Dr. Cassells has rendered a service to others than members of his own profession. His well got-up and very readable book on Deaf-mutism is full of matter which would be interesting to anybody of ordinary curiosity.

Farming, like other things, has its host of teachers ready to show anybody for two shillings or less how to do what was formerly thought to require a seven years' apprenticeship to learn. Mr. R. Warrington treats of the "Chemistry of the Farm" in the usual Handy Book form (28).

Mr. Prout's (29) treatise has all the appearance of being a practical examination of the subject by a man of practical experience.

(14) *Uncle Antony's Note-book*. By Mary Caumont. London: F. V. White & Co. 1881.

(15) *Old Oscar*. By H. G. Reid. Illustrated. London: "Home Words" Publishing Office.

(16) *The Physiography of the Upper Engadine*. By Francis Lloyd. London: Edward Stanford. 1881.

(17) *Davos Platz, and the Effects of High Altitude on Phthisis*. By Alfred Wise, M.D. London: J. & A. Churchill. 1881.

(18) *Birchington-on-Sea, and its Banglows*. By Athol Mayhew. London: B. T. Batsford. 1881.

(19) *My Visit to the Goldfields in the South-East Wynaad*. By Samuel Jennings, F.L.S., F.R.G.S. London: Chapman & Hall (Limited). 1881.

(20) *Foreign Countries and British Colonies—France*. By the Author of "Mademoiselle Mori." London: Sampson Low & Co. 1881.

(21) *Cries in a Crisis*, &c. By R. A. Macfie. Second Edition. London: Edward Stanford. 1881.

(22) *Household Horticulture*. By Tom and Jane Jerrold. London: Chatto & Windus.

(23) *Kitchen and Flower Gardening*. London: Ward, Lock, & Co.

(24) *The Cookery Instructor*, &c. London: Ward, Lock, & Co.

(25) *Oxford Study Guides—Entrance Classical Scholarships*.

(26) *The Rudiments of English Grammar and Composition*. By J. Hamblin Smith, M.A. Livingtons. 1882.

(27) *Deaf-mutism and the Education of Deaf-Mutes*. By Dr. A. Hartman. Translated by Dr. J. P. Cassells. London: Baillière, Tindall, & Cox. 1881.

(28) *The Handy Book of the Farm Series—The Chemistry of the Farm*. By R. Warrington. Bradbury, Agnew, & Co. London.

(29) *Profitable Clay Farming under a Just System of Tenant Right*. By John Prout. London: Edward Stanford. 1881.

**TOTLAND BAY, Isle of Wight, near Alum Bay.—TOTLAND BAY HOTEL.** Magnificent sea views. Comfort, with moderate charges. Billiard-room and tennis lawn. Bracing air. Excellent sands and promenade pier. Good anchorage for yachts. Special bath and boat service, Friday, 2 P.M. Returning Monday, 7 A.M.—Apply to Miss FLEMING, Manageress (late of the Langham Hotel).

**ILFRACOMBE HOTEL.—On the verge of the Atlantic, in** its own Grounds of Five Acres, with Tennis Lawn. Contains 250 Rooms, and is a model of sanitary excellence. One of the largest Swimming Baths in England; also Private Sea-water Baths. Every information of MANAGER.

## LOSS OF SIGHT.

AT least one-fourth of those suffering from Blindness can trace their inability to the use of common spectacles or lenses imperfectly adapted to the sight. Mr. HENRY LAURANCE, F.R.S., Oculist Optician, personally adapts his Improved Spectacles in all cases of defective vision daily at his residence, 3, Edinburg Gardens, Euston Square, London, from Ten till Four (Saturdays and Sundays excepted). Mr. Julius Benedict, Manchester Square, W., writes: "I have tried the principal opticians in London without success, but your Spectacles suit me admirably; the clearness of your glasses is compared with others nearly surprising." Mr. LAURANCE's pamphlet on "Spectacles: their Use and Abuse" (sent free by post) contains valuable suggestions to sufferers from defective vision, testily to the benefit they have derived from the scientific adaptation of Mr. LAURANCE's Improved Spectacles. Consultation free.

EGYPT.

THE true history of the untoward revolution in Egypt will perhaps not be fully known at present. According to the first accounts, which were intrinsically incredible, the English Consul-General seemed to have made or encouraged concessions to the mutineers; but it now appears that Mr. COOKSON, acting on behalf of the Khedive, evaded or refused their principal demands; and Mr. COLVIN had already endeavoured to obtain the arrest of the ringleaders. The special terms on which the insurgent officers insisted are much less important than the partial success of the revolt. SHERIF PASHA, whose appointment as Minister was one of the professed objects of the insurrection, so far repudiated complicity with the plot as to refuse, in the first instance, to accept the nomination. The absurd demand for a Constitution proffered by the chiefs of a military revolution must, if it was seriously advanced, have been intended to imply the appointment of a Council to be composed of confederates of the mutineers. The audacious proposal that the numbers of the army should be increased to 18,000 men was probably made in earnest, for the purpose of increasing the strength of the temporarily dominant faction. When an armed body assumes the control of affairs in any State, liberty is for the time suspended. It matters little whether the immediate demands of mutinous soldiers are extravagant or ostensibly moderate. Their power to dictate to the regular authorities the terms of any arrangement involves the absolute despotism of their leaders. Although the officers in command of the regiments appear on the present occasion, as formerly, to have stimulated and directed the mutiny, there is reason to fear that the disaffection in the army is general. The principal officers of one regiment have been dismissed by their men for expressing disapproval of the revolt; yet it is possible that the rank and file of the army may be mere instruments in the hands of their disloyal superiors. The Egyptian peasantry has no military propensities; and probably the privates would not unwillingly return to their homes if it were possible to disband them. Neither officers nor soldiers have any associations of military glory, inasmuch as none of them have any experience of war. The auxiliaries which were sent from Egypt to the European provinces of Turkey during the Russian war were, for the most part, kept at a distance from the scene of active operations.

The Egyptian army is not required for purposes of defence or of external warfare. A moderate police force would easily preserve order among an industrious and unwarlike population. The repression of the slave-trade on the Southern frontier, even if it were efficiently prosecuted, would only require a small regular force; and the Abyssinian KING would no longer give periodical trouble if he were made to understand that encroachments on Egyptian territory would be resented by the European Powers. There is perhaps some truth in the assertion of a French journal that the mutiny is to be attributed to the idleness of an unoccupied soldiery; but in time of peace much larger armies have little or nothing to do, and yet they obey their superiors and acknowledge the paramount authority of the Government. The Egyptian officers discovered their strength some six months ago by their successful resist-

ance to an injudicious attempt to disband their troops, when the KHEDIVE had no means of paying them in full. They were then encouraged by Baron DE RING, who was consequently recalled by his Government. It is not known whether on the present occasion they have been excited by political intrigues. According to some conjectures, their leaders have received encouragement from Constantinople, though it is not stated whether their alleged accomplices held any official position. It seems improbable that the SULTAN, who spends his time in guarding against possible conspiracies, should favour a military revolt directed against his principal feudatory; but the secrets of Turkish policy are hard to discover, inasmuch as obvious interests and professed principles afford no trustworthy clue to the practice of politicians. The motives of military insurgents are essentially simple when they have no armed resistance to fear. The colonels of the regiments which besieged the palace and compelled the KHEDIVE to negotiate were primarily actuated by a love of power, and probably of money. If they can compel their Sovereign to change his Ministry they can also insist on an increase of pay, or on more sweeping pecuniary concessions. They are perhaps not sufficiently enlightened to perceive that their triumph is precarious. Any prudent adviser could inform them that the destinies of Egypt will not be permanently controlled by an insignificant body of raw troops or by their undistinguished leaders. The few names of mutinous officers which are mentioned in the reports are wholly unknown in Europe.

It is remarkable that the mutineers professed a friendly disposition to foreigners, or, in other words, to the English and French officials who manage the finances and other branches of Egyptian administration; but SHERIF PASHA, whom they proposed as Minister, affects to be the head of the national party, which, as its name implies, is opposed to European interference. The colonels who conduct the revolt are probably by this time aware that they have nothing to hope from the English representatives. The KHEDIVE might perhaps have defeated the attempt if he had possessed sufficient courage and energy to follow the advice of Mr. COLVIN by arresting the principal ringleaders. M. DE BLIGNIÈRES had, a few days before, left the country for a time, and probably none of his subordinates were qualified by influence or official rank to take an active share in the defence of the Government. Mr. MALET was engaged on a mission to Constantinople of which the purport is not yet fully known. It is believed that the English Government, foreseeing the probability of the revolt, was in certain contingencies prepared to invite the occupation of Egypt by Turkish troops. The measure would, notwithstanding obvious objections or difficulties, probably be the most expedient which could at present be adopted, should the military revolt be renewed. The employment of a joint French and English force would involve more serious complications; and it is impossible to allow the establishment in Egypt of an irresponsible military Government. If a sufficient Turkish force were despatched to Egypt, there would be little risk of resistance on the part of mutinous troops. Many of the regiments would probably refuse to fight, even if the chances of success were equally balanced. That they would expose themselves to certain defeat is in the highest degree improbable. In Egypt the army stands apart from the population, which would not

dream of taking part in any conflict. It is not impossible that the menace of a Turkish expedition would enable the KHEDIVÉ to disband the mutinous regiments.

It is not surprising that some French journalists seize the opportunity of exciting popular jealousy against England. Some of them insinuate that the policy which was never disavowed by Baron DE RING had really been pursued, not by a French functionary, but by his crafty English colleagues. It is, according to the mischief-makers, remarkable that the French Controller should have left Egypt, and that the revolt should immediately have broken out on his departure. It is accordingly suggested that it would be desirable to despatch some French iron-clad ships to Alexandria, and to protest against the employment of Turkish troops to suppress the insurrection. It is unnecessary to inquire whether ill-informed writers share the suspicions which they express. If the test of *cui bono*, or of the party which profits by the transaction, is applied to the mutiny, the English Government must be acquitted of any interest in a most troublesome occurrence. The singularly artificial arrangement which has now lasted in Egypt for a considerable time was chiefly objectionable because it was liable to disturbance. Whatever opinion English politicians may have formed of the stability of the joint French and English administration, they have been unanimous in deciding to prolong it as long as circumstances may allow. It is doubtful whether it would have been prudent five or six years ago to accept the advice which is supposed to have been tendered to Lord BEACONSFIELD'S Government by Prince BISMARCK. At that time the French Government would perhaps not have opposed the establishment in Egypt of an English protectorate; but M. THIERS always intimated the repugnance with which his countrymen would have regarded an apparent attempt to profit by their temporary weakness. The consequence of the deference shown by the English Government to French susceptibility was the complicated contrivance which has hitherto worked with unexpected facility. The organs of the French Government express a just confidence in the good faith of England. If both Powers concur in the best means of attaining the common object, the triumph of the Egyptian mutineers may probably have accelerated the restoration of the free action of the KHEDIVÉ. If the English and French Governments were to intrigue against one another, the disloyal officers might perhaps for the moment profit by their disunion. Notwithstanding the suspicious connexion of the name of SHERIF PASHA with the mutiny, it seems that confidence is reposed in his integrity. If the reports of English newspaper correspondents are well founded, the new Minister has persuaded the mutinous officers to submit to the partial disbandment of the army.

#### IRISH MANUFACTURES AND IRISH SEDITION.

IRISHMEN have been doing their best during the past week to relieve Dublin of its reputation of being a dead-alive capital. The meeting for organizing the proposed Exhibition of Irish Manufactures, and the Land League Convention, have, in different ways, displayed the national spirit, and there may possibly be some persons who regard the display as satisfactory. As to the proposed Exhibition of Irish industry, it was obvious from the first that, in the mood in which the most influential organization in Ireland is at present, very little good could be hoped from it. Persons of the moral and intellectual calibre of Mr. SEXTON and Mr. T. P. O'CONNOR may think, or at any rate may say, that England is jealous of Irish industry. It is hardly needful to remark that there is no Englishman in possession of his senses who would not be very glad to see Ireland busy, because every Englishman in his senses knows that, until the ruinous concentration on agricultural employments, which cannot possibly support the population in comfort ceases, Ireland will never and can never be contented. The absence of the necessary natural conditions in the way of mineral wealth seems indeed to be a fatal bar to a very great extension of manufactures in Ireland; but some trades are in a measure independent of this, and the combination of agriculture and home manufactures which exists at present in Ulster, and which is also found in some of the most prosperous provinces of France, might probably be extended with much advantage. At any rate, such impulse as an Exhibition can give is grudged by no mortal to Ireland, and the ready response which has been

made by the wealthier classes to the demand for guarantees, compared with the meagre subscriptions of the Land League and the Land League partisans, shows clearly the state of the case. But the League has no intention of being outbidden; and it has been evident from the first that the Exhibition was to be made, if possible, an engine for further inflaming Nationalist passions and for assisting the campaign of Mr. PARNELL and his friends against English rule and English law. The weighty words of Archbishop MCCABE—words which, it is rather painful to think, are in striking discord with other words of dignitaries of the Roman Catholic Church in Ireland on similar subjects—do not express any sentiment that Land Leaguers are likely to share. That the employer must be contented with fair profits, the employed with fair remuneration, and that the customer must not be expected to put up, for the sake of the *beaus yeux* of an imaginary Ireland, with worse or dearer wares than he can buy from Englishmen, or Frenchmen, or Americans, are truths too commonplace to commend themselves to the followers of the "Pinchbeck O'Connell."

When the meeting actually took place, the presence of Mr. SEXTON as the chief speaker of the League party would of itself have sufficiently indicated the probable course of events. That this person should—after the atrocious speech in which on Tuesday he recommended violent resistance to the Emergency Committee, remarking that, "if Mr. GODDARD or any of his men lost their lives, it would be a justifiable homicide"—be still at large, despite the Coercion Acts, is an unlucky omen of the probable conduct of the Government during the coming winter. But when Mr. SEXTON appeared with Mr. T. P. O'CONNOR and Mr. BIGGAR as his supporters, there could be no doubt at all of what would happen. The daily papers have informed their readers very fully of what did happen. Dr. LYONS, the Liberal member for Dublin, was howled down; Mr. O'CONNOR, when appealed to to moderate the rancour of his followers, remarking that "this disgraceful scene should not be permitted, and Dr. LYONS should at once sit down." The Leaguers insisted on the QUEEN, the LORD LIEUTENANT, and all such persons being excluded from the rank of patrons. They yolled down a proposition to admit English plant used in the production of Irish manufactures. Accounts differ as to the constitution of the actual committee which was at last voted; but it is significant that Mr. DAWSON, a Land Leaguer and a member of Parliament, threatened all guarantors who, in consequence of the result of the meeting, should withdraw their guarantees, with Boycotting. This is probably the nearest approach to direct extortion of money by the machinery of the League that has been publicly made; but it is idle to suppose that much notice will be taken of it by the authorities. It is, indeed, very probable that the action of the Land League is in reality directed rather to the arrest of the whole movement, which is inconvenient and unmanageable to it, than to an attempt to assume a control which it has hardly the means of practically carrying out. Unless the League were to Boycott every manufacturer who did not contribute (and it is rather surprising that Mr. SEXTON or Mr. DAWSON did not suggest this means of securing a successful Exhibition), its preponderance on the Committee would hardly be likely to be greeted rapturously by Irish capitalists.

The League's own Convention followed this disgraceful scene at an interval of twenty-four hours. Every means had been taken to give the meeting the air of a distinct protest against English rule rather than a conference of the body which certain English Radicals delight to compare to the early Trade-Unions. In the resolutions proposed for discussion, when they are stripped of their Nationalist rant and of the inevitable adjectives which grace every Irish manifesto, there is sketched out a very practical scheme of preventing the Irish tenants from being contented with the Land Act. The labourers' clauses of that Act—which it may be well to remind Irishmen were the work in great measure of the English Opposition, the Land League and the Government having been equally oblivious of the labourer—are accepted as a whole, because there is a labourers' meeting sitting contemporaneously in Dublin, and it is not safe to offer them less; while the farmers are not prepared to grant more. But, as far as actual tenants themselves are concerned, a line which is not unskilful, and which will very likely be effectual, at any rate in part, is taken up. The farmer is warned that

if he accepts the Act he pledges himself to fifteen years' payment of rent without hope of abatement, and the spectre of American competition is dangled before him, so that he may be afraid to give the pledge. This is, of course, in a different form, the old Land League device of bidding the people refuse to pay rent, in order that they may be turned out of their holdings. If they persist in rejecting the statutory tenancy, they can be forced by the Court to take it or be ejected, and this will swell the band of farmless tenants, who are just now the chief hope of the League. It is true that Mr. PARNELL does not as yet utterly condemn the new Court. He and his friends will present certain "test cases," with the object, doubtless, of seeing whether the Court can be cajoled or bullied into reducing the rents to a merely nominal sum. So little is known of the new Commissioners that it is impossible to say what their stamina may be. But it is perfectly possible to see what would be the result of their proving recalcitrant. The agitators could at once go to the country, strong in the double cry that the people had been deceived, and that, as so much had been wrested from the English Parliament already, it was not likely to resist a further exhibition of the same tactics.

That the actual proceedings of the Convention should, at any rate in its earlier sittings, have been uninteresting enough, is not surprising. It is more remarkable that there should have been one delegate to protest, if only on business grounds, against the mixing up of the direct objects of the League with Nationalist projects, than that even among twelve hundred there should not have been more than one. Mr. PARNELL'S speech was only a paraphrase of his programme garnished with plenty of bitter words for the occasion. The cut-and-dried telegrams from America urging the adoption of something more than his policy, and threatening the stoppage of supplies in case of surrender to the Land Act, could have been foretold in substance, and almost literally by any tiro in politics. What is important is that the organization now stands fully committed to the disruption of the Empire, and to an acceptance of the Land Act only in such a sense that even the present Parliament might probably, if that sense were accepted by the Court, think of repealing or modifying the Act next year. There will doubtless be secessions, or attempted secessions, from the League; but it is altogether erroneous to say that any general dissatisfaction with its irreconcilable policy is being shown in Ireland, or that its tools are turning blunt in the hands of the users. On the contrary, in Munster at least, and in parts of Leinster and Connaught, lawlessness and outrage are steadily on the increase as the nights grow longer; and, though the Government does not refuse help to the gallant efforts of the Emergency Committee in defence of property, it seems utterly unable to devise any scheme of protecting life and limb. Perhaps Mr. FORSTER'S return to Ireland may lead to more energetic action. Except that jesting with the Land League is not a safe amusement now in Ireland, it appears strange that on Wednesday some one did not suggest to Mr. SEXTON the organizing of a special Land League annexe in the Exhibition of Irish Industry. A Boycotted household might well replace the Japanese tea-houses and such like things which have diverted visitors to former Exhibitions; and wax models of dead landlords, specimens of mutilated cattle, and ear-split herdsmen, with pikes, masks, dynamite clocks, and other such implements of the business, would compose a section at least as interesting as some others, and far more representative of the actual industries of Ireland under the sovereignty of the Land League and the Premiership of Mr. GLADSTONE.

#### FRENCH PARTIES.

THE useful map which the *Times* printed in its outer sheet on Wednesday is a conspicuous proof of the growing interest which Englishmen take in French politics. For the first time a great English newspaper has taken as much pains to make the result of a French general election intelligible to its readers as it would have taken had the election been an English one. It has given them a map of France, with the political complexion of every constituency plainly marked. It would hardly have been possible to represent by a system of shading the subdivisions of the victorious party; and the simple division of the deputies into Bonapartist, Monarchist, and

Republican is, for some purposes, the most significant that could have been adopted. It shows, with almost startling clearness, the practical unanimity at which Frenchmen seem to have arrived for the present as regards the form of their political institutions. The white spaces which stand for the arrondissements that have returned Republicans constitute almost the entire map. In the eastern half of France there are only six exceptions, four Monarchist and two Bonapartist. If the Republicans did but know their own interest they would read in this conspicuous triumph the most effectual incentive to moderation. So long as Bonapartists and Monarchists formed a large part of the Chamber of Deputies, and were proportionately strong in the country, it was at least arguable that the Republic could not safely lay aside its militant character. It must remember that it had bitter and formidable enemies, and lose no opportunity of hitting them hard. Now that Bonapartists and Monarchists are alike driven from the field, the Republic can afford to be conciliatory. There is no longer an adversary in arms against it. The result, which has been coming nearer and nearer ever since 1870, is at length virtually accomplished. The Republic is not merely the strongest party in France, it has apparently become France. The opinions of this or that class of citizens, which once perhaps it was excusable to treat as necessarily identified with hostility to the Republic, need no longer be thus regarded. There is not now any organization arrayed against the Republic which can turn these opinions to its own purposes. Whether the Republic has been right or wrong in its policy towards the Church, it must be admitted that there was a time when the Church was the stalking-horse of one conspiracy after another. It has ceased to be so perhaps from no better motive than the dying out of the conspirators; but politicians ought to think more of results than of motives, and to be content to see their adversaries rendered powerless, without inquiring too closely into the reasons which have made them so. At all events, the time has come when overtures of peace might be safely made, and would certainly be accepted. The conflict with the Church, in which the French Government has voluntarily engaged, has been more successful than the German *Kulturkampf*, because the Government might now, to all appearance, conclude a treaty on the principle of *uti possidetis*. What it has gained, it would be allowed to retain. The Jesuits might remain exiles, the non-recognized religious orders might continue dispersed, and yet the Pope would look benignly on the Government by which these things had been done, and the Nuncio would be instructed to say pleasant things to the Foreign Ministry, and to preach submission and patriotism to the clergy.

It is needless to say that these are not the reflections which this map, or the facts which it presents, have suggested to the party in power. A French politician knows of no use to which a vanquished enemy can be put except to be jumped on. The more seemingly hopeless the position of a party is, the more reason there is for insulting it by word and act. It is this that constitutes the real danger of every successful French party. The first thought of no matter who is in power, is how he can make his supremacy felt. To do this it is not enough that he should be free to give effect to his own ideas for his own benefit. They must be made to minister to some one else's annoyance. What the extent of that annoyance should be may differ at different times. The amount of suffering which it pleases the existing Republicans to inflict falls very far short of that which it pleased the Republicans of 1793 to inflict. But the principle which underlies the two processes is the same. The measure of the suffering in each case is not the real or supposed necessity of the situation, but the will of the party which has the power to inflict it. A Frenchman jumps upon his enemy, not because his enemy may rise up and hurt him if he does not, but because he has the power to jump upon him, and feels a genuine pleasure in exerting it. All that the French Government has done to the Church appears to it to be only a reason for doing more. Its object is never really attained so long as it is possible to attain it with more of technical completeness. As yet the attack has been chiefly directed against the regular clergy; but it is plain that the secular clergy will be the next victims. M. CLÉMENTEAU, M. GAMBETTA, and M. FERRY are agreed that something more must be done to punish the Church, and whether the penalty takes the

form of entire repudiation by the State, or of what is euphemistically called a stricter application of the Concordat, is only a question of degree.

The facts of which the *Times*' map is the expression have naturally set the French Monarchists thinking who is to blame for the extremely poor figure they made in the elections. "An ex-Deputy," who is understood to be M. DE FALLOUX, has been saying in the *Figaro* that the whole blame falls on the Legitimists. In his opinion the present business of a Monarchist is to drop all reference to monarchy. Religious and social interests of infinitely greater moment than any form of government are now threatened, and Monarchists ought to remember that they are Christians and fathers of families before they are Legitimists. Had they done so last month, they would have said nothing about the Count of CHAMBORD and a great deal about the religious orders and godless education. The reply of the Legitimists is, that the "ex-Deputy" entirely misunderstands the situation. He writes as though the religious and social interests of which he is the self-constituted champion could be safe under a Republic, whereas experience has shown again and again—what the inner consciousness of Legitimists has always assured them—that in France at all events the legitimate monarchy is the one source from which all good things do come. You, they tell the "ex-Deputy," have no right to call yourself a Monarchist; you are a Conservative Republican. It cannot be denied that the course of events since Marshal MACMAHON's retirement has been more favourable to the Legitimist theory than to that of the "ex-Deputy." Those who, even when M. THIERS was in power, believed, or affected to believe, that the Republic must inevitably become anti-Christian, are not likely to feel their conviction on this head weakened by speeches like those of M. PAUL BERT, or by acts like those of the Mayor who at a recent examination of a Communal School presented prizes to two young citizens who had omitted to make their first communion. Incidents of this kind are the natural weapons of the party which preaches that all other considerations should be postponed to the restoration of the Count of CHAMBORD, because, until that has been brought about, there can be no security for the things that Conservative Republicans profess to value.

Even Prince NAPOLEON seems to have realized that the defeat of the Bonapartists at the elections imposes upon him an act of apparent self-denial. He is about, it is said, to resign his claim to the Imperial succession in favour of his son. His next step will perhaps be to declare that in doing this he has merely got rid of a troublesome and useless burden, and left himself free to serve as a simple soldier in the Republican army. It is pretty plain that the dignity which he thus magnanimously puts from him is to him less than valueless. If his ambition is ever gratified, it will be as a Democratic saviour of society, not as the rebuilder of an Empire. By giving his son the chance of appearing in the latter character, if he should ever be offered an engagement, Prince NAPOLEON does not damage the peculiar and limited prospect which is all that can ever be open to him, while he ceases to irritate the strict Imperialists by playing the part of dog in the manger.

=

#### THE TRADE-UNIONS CONGRESS.

THE praise which has been generally bestowed on the Trade-Unions Congress is perhaps not an unmixed compliment. The moderate style of the opening address and of the Report of the Parliamentary Committee has evidently taken newspaper writers by surprise. Having had their own way in recent legislation, the Trade-Union leaders abstain on the present occasion from declamations against capital, and their demands of further privileges are expressed in temperate language. Notwithstanding a disclaimer contained in Mr. CRAWFORD's address, the Trade-Unions and their delegates still devote their exclusive attention to the promotion of the interests of their own class. As it happens that the associated artisans have acquired paramount political power, their organization is formidable and alarming. The managers of the Congress had good reason for excluding from their proceedings apologies for the system which is now irrevocably established. Juridicious politicians long ago recognized the power of workmen to form Unions, with the obvious inference that

it was useless to discuss their moral right to do what they could not be prevented from doing. It by no means follows that the operations of the Unions are uniformly beneficial or harmless. The Chairman of the London and North-Western Railway, who is neither a politician nor a theorist, stated at the last general meeting of the Company that the intervention in one trade dispute of a Union agitator, who is also a member of Parliament, had taken 100,000*l.* from the traffic receipts of the railway. The loss to the traders and to the workmen themselves must have been enormously greater. The transaction is rather representative than exceptional; but it is not likely to be noticed by the speakers at the Congress. Readers of the discussions might almost forget that the chief function of Unions is to render strikes possible and sometimes successful. In promoting such measures as the Employers' Liability Act the Unions are perhaps more legitimately occupied; but their proposal that workmen shall be prevented from contracting themselves out of the Act is more than questionable. Their actual intended interference in general politics will be an unmixed evil.

Mr. CRAWFORD, in his well-written address, quoted, as an instance of mistaken apprehension, Mr. LOWE's prophecy, delivered in 1866, that if the body of workmen were admitted to the franchise, the Union machinery was "ready to launch their votes in one compact mass 'on the institutions and property of the country.'" The Union leaders boast that, notwithstanding their attainment of political power, the Unions have as yet done nothing of the kind. Since the establishment of household suffrage in boroughs there have been two general elections, for in 1868 the new voters were scarcely prepared for the exercise of the suffrage; and the principal change produced was the increased venality of many constituencies. In 1880 the class which supports Trade-Unions responded eagerly to the inflammatory appeals of an orator who for the time descended from the rank of a statesman to the occupation of a demagogue. The same speaker who boasts of the confutation of Mr. LOWE's forebodings demands that, in future, candidates and party leaders, instead of appealing directly to the working classes, shall communicate exclusively with the leaders of the Unions. The result of conceding his demand would be either gross and general corruption of the American type, or a process of "launching votes in one compact mass 'on the institutions and property of the country.'" The speakers at the Congress already insist on the extension of household suffrage to the counties, for the strictly political purpose of extending and confirming the supremacy of the working class over all other sections of the community. In a still more ambitious spirit, and in total neglect of the professed objects of the organization, the Parliamentary Committee demands the enactment of a Land Bill on the model of the Irish Act, although it could in no degree concern the great body of artisans. The cynical cupidity of agricultural demagogues who seek to appropriate the property of the landowners commands the ready sympathy of the Union managers. Tenant-farmers, remembering the agitation promoted by Mr. ARCH, will probably hesitate to accept the support of associations formed for the sole benefit of workmen.

One of the political objects to which the Congress is invited by its leaders to devote its energies is the prevention of every war, irrespectively of its merits or tendency. The pardonable ignorance of artisans furnishes no excuse for a presumptuous claim to regulate interests which they have not troubled themselves to study or understand. No party in England is indifferent to the evils of war; but better-instructed politicians are aware that material welfare, as well as national honour, largely depends on the ability and readiness of a country to defend its rights. Even extreme Liberals who know something of public affairs and of history admit and assert the necessity of maintaining a navy which may be more than a match for that of any single Power. At this moment the influence of England in the regions which include the means of communication with India depends, in the last resort, on the military and naval resources of the Empire. The working classes would be among the first to feel the consequences of the impression which their leaders seek to produce, that the task of protecting English commerce and territory is to be abandoned by the Government. Pure democracy, which is in other respects an admirable system, is

lation is more sensitive to the claims of national dignity. It is perhaps possible to attach too much importance to the crude notions of ambitious and inexperienced orators; but Mr. Lowe's warnings are justified by the vague political agitation which seems to be in some degree superseding the special functions of the Trade-Union Congress. On one point the apparently unanimous judgment of the delegates may perhaps have a useful result. It appears that the manufacturing operatives retain their ancient belief in the advantages of Free-trade. As they are not disposed to join the Fair-trade Protectionists, the factitious movement will probably soon collapse; though the expulsion of certain Fair-traders under the pretext that they had violated Union etiquette by paying their own expenses may be thought to savour rather of individual jealousy than of orthodox abhorrence. It was for the alleged benefit of the artisans that retaliatory or reciprocal duties were to be imposed.

It would be unreasonable to blame one industrial class for combining to promote its own interests, while capitalists employ the same modes of proceeding. The Lancashire cotton-spinners find it necessary to limit or suspend their production, because a body of speculators and brokers in Liverpool have forced up the price of cotton to an artificial level. The defeat of the monopolists concerns the workmen as much as their employers, and they will perhaps be the chief sufferers by the interruption of their industry. They have no reason to regret that the master manufacturers are probably powerful enough to counteract the mischievous ingenuity of the Liverpool gamblers. The question will perhaps be discussed before the close of the Congress, as it concerns the associated trades much more nearly than land tenure, or the theory of peace and war. Other matters of equal relevance and importance will probably not be noticed. The delegates will be disinclined to reopen the question of the expediency of the diminished hours of labour which have been secured by the efforts of the Unions. Mr. SAMSON LLOYD, who lately presided at a Fair-trade meeting, deviated into the more practical inquiry whether English artisans could by fifty-eight hours' labour in the week effectually compete with French rivals working for seventy-two hours. It is not certain that a true answer would be in the negative; and the leisurely classes ought to sympathize with the claims of workmen to reasonable rest and recreation; but there is no doubt that some competent observers watch with anxiety the effect of short hours of labour on English industry. The settlement of practical controversies of the kind by combination is inevitable, and therefore it may be considered reasonable. The wishes of a minority will probably be overruled; but if there were no Trade-Union the great body of workmen might be deprived of the liberty of choice. It is unfortunate that the Unions should, in accordance with the modern custom of all associated bodies, hold Congresses and listen to speeches which are naturally devoted to the exaltation of their powers and their rights, with little reference to their duties. It is necessary to acquiesce in their political activity, but not to think it beneficial.

#### LONDON FISH SUPPLY.

THE Corporation of London has seriously taken in hand the question of the Fish Supply, and their present activity may be accepted as an atonement for much previous delay. So long as the work is done and done properly, it will be only an additional recommendation that it is done by those to whom it belongs by prescription. So far as the Corporation in their character of the market authority are specially concerned with it, the question does not present much difficulty. The two recommendations of a market are neighbourhood to the supply and easiness of approach. The first secures that the market shall be always well filled with goods; the second secures that these goods shall be carried with no unnecessary delay to all parts of London. As regards fish, neighbourhood to the supply can, in London, only mean neighbourhood to the two great means of carriage, the river and the railways. Formerly only the river had to be considered, but of late years the railway has become a very serious rival to the river. What is chiefly to be desired in the interest of the public is that these two sources of supply should go on existing side by side. If

Londoners are to be left dependent on one of the most effectual guarantee of cheapness will be wanting. Competition has a wonderful effect in keeping down rates of carriage; and, though in theory it is the interest of carriers to make their trade as large as possible by carrying goods on easy terms, they seem, when there is no outside stimulus, to care as little for their own interest as if it were somebody else's. Easiness of approach means that the market is in a central position, so that all parts of London get supplied as nearly as possible at the same time, and that the streets leading from it are spacious, so that the fishmongers shall start on their journey with no unnecessary delay. At present none of these requirements are fulfilled in London. There is only one fish market, and that, in its existing state, is eminently unsuited for the purpose. Billingsgate is convenient, so far as situation goes, for fish that comes by water; it is not convenient, even in this respect, for fish that comes by railway. Fish that comes by water has to be landed before it can be sold, and the accommodation that Billingsgate affords in this way is far in the rear of the demand. When the fish has been landed and sold, it has to be carried away, and to carry it away is as tedious a process as to get away from a London crush. The fishmonger has his cart, just as the great lady has her carriage; but, like her, he is separated from it by a swarm of other vehicles, which make movement for a time impossible. Somebody must be last on these occasions, and to the fishmonger being last may easily mean serious loss.

The speakers in the debate in the Common Council seem to have been perfectly alive to the two last faults in the Billingsgate site. The Chairman of the Markets Committee, who wishes to see Billingsgate retained, at all events as a market for water-borne fish, declared that standing room for double the number of vans and carts now attending the market is urgently required, and even made the retention of the market depend on the willingness of the Government to sell the site of the Custom-house to the Corporation. What was not equally well appreciated was the improbability that the same market would be found equally convenient for fish coming by railway and fish coming by river. A great deal of opposition to the retention of the Billingsgate site seems to have been unreasonable. It is surely more convenient, as regards the bringing of fish to a waterside market, that it should be placed as low down the river as is consistent with its being fairly central, and especially that it should be below rather than above London Bridge. A fish market at Blackfriars, which was the waterside alternative presented to the Council, would involve the passage under three bridges with all the consequent danger and delay. No doubt, if Billingsgate cannot be improved so as to make it adequate to the needs of the water-borne fish traffic, another site must be found, and in that case it may be that Blackfriars, notwithstanding the difficulty about the bridges, may prove to be the best site. Mr. RUDKIN painted the advantages of the Blackfriars site in the brightest colours he could command. All, however, that he succeeded in showing was that a market of adequate size, and provided with adequate approaches, would be very far preferable to the existing market. But this is just what nobody denies. Billingsgate, as it is, does not supply the accommodation needed even for water-borne fish; and if that accommodation cannot be obtained at Billingsgate the water-side fish market must be moved elsewhere. What Mr. RUDKIN ought to have shown, but did not, was that this accommodation is not to be had at Billingsgate. The argument that the poor would go in thousands to buy their own fish if the market were made more accessible is nothing to the purpose as regards the comparative merits of the two sites. If Billingsgate were enlarged and provided with proper approaches, it would be nearer some of the poorest districts of London than Blackfriars. Mr. RUDKIN, it is true, went on to say that the fishermen on the Yorkshire coast are prepared to deliver daily at the Blackfriars market all their catch—say 50,000 lbs. of fish at 2½ per lb., so that it could be retailed at an ample profit for 3d. per lb. They would decline, however, to have anything to do with Billingsgate, because the sale there is so uncertain. What we take this to mean is, that at Billingsgate, as it is at present, the sale is uncertain. Probably there is not sufficient provision for the retail trade. The market is too much in the hands of the large dealers, who are not anxious to encourage the trade as

what they call "offal" fish, which stands for any fish other than salmon, turbot, brill, and soles. Probably also, as fish from the Yorkshire coast must all come by railway, the undoubted disadvantages of Billingsgate as regards the disposal of railway-borne fish had some influence in provoking this determination to have no dealings with London so long as Billingsgate remains the one London fish market.

The attack upon Billingsgate and the defence of it seem equally exaggerated, the error in both cases being due to the unwillingness of the speakers to admit that the only adequate solution of the difficulty lies in the immediate establishment of two markets—one for water-borne fish in the immediate neighbourhood of the Thames, another for land-borne fish in the immediate neighbourhood of as many as possible of the railways which serve the fishing districts. When once this condition has been conceded, the retention or abolition of Billingsgate can be discussed simply upon its merits. The issue will then be found to be very much narrowed. At present it is constantly confused by the controversy whether water or land-borne fish form the most important constituent of the London fish market, and to which, in the choice of a site, most deference shall be paid. When it is treated simply as a question relating to water-borne fish, it will, we suspect, be seen that the advantages of a site below London Bridge over one above London Bridge are decisive, and that the only thing to be determined is whether Billingsgate can be made adequate to the demands of the water-borne trade. If it can, the difficulty of finding an equally good site below London Bridge, and the natural unwillingness of a trade to leave a market to which it is accustomed, will probably be found final reasons for keeping the market where it is. It may be well to repeat, however, that this conclusion presupposes that there are to be two fish markets in London. The steady growth of the railway fish trade makes it impossible that it should be much longer sacrificed to the trade in water-borne fish. At present, the latter finds a market awaiting it where the fish are landed, while the railway fish trade has to send its fish to a market far away from the station at which it arrives. If there is to be a single market for both trades, it should, plainly, be at some place where the sacrifice, at present made entirely by one, should be fairly shared between the two. There is no reason, however, why either trade should be called on to make a sacrifice which would be rendered needless by the simple expedient of having one fish market on the river bank and another as near as may be to the railways which bring fish to London. The argument that a double market means double trouble for the retailers might perhaps be disposed of by the adoption of more reasonable hours for marketing in fish than those which at present prevail.

#### THE FAIR TRADE AGITATION.

THE supporters of Protection under its new title of Fair Trade were injudicious in forming a League and in holding a meeting. But for their public challenge, they might have acquired credit for a strength which they have not been able to display. Three county candidates, all of respectable position and considerable ability, had simultaneously expressed entire or partial approval of their doctrines, though Mr. LOWTHER, with characteristic boldness and creditable candour, called Fair Trade by its proper name of Protection. The meeting in London was not attended by a single known politician; and the promoters had not even succeeded in establishing among themselves any preliminary understanding. The chairman was a cooper, who is discontented at the importation of foreign goods, not because a supply of useful commodities is injurious to the consumers, but on the ground that many articles are packed in foreign casks. The packages remain when the contents are extracted, to be sometimes used again by thrifty English producers. The meeting found it impossible to agree even on the fundamental principle of the party that a duty ought to be imposed on foreign corn. One sagacious economist contended that such a duty would only increase the cost of bread by the amount levied at the Custom House. That English corn-growers would add the same sum to their own prices had apparently not occurred to the Fair Trade intellect; yet it is certain that no farmer would trouble himself to cause an artificial increase in the price of foreign corn except for the purpose of adding the same amount to his own charges.

The majority of the League may probably have been less puzzle-headed; but the object which they met to promote is so chimerical that it is scarcely worth while to inquire whether a corn duty, if it were practicable, would be just and expedient. Mr. BRIGHT, with his habitual readiness, described the advocates of Fair Trade as the "baser sort of Tories." It would be more reasonable to say that, as far as the movement is political, its supporters are engaged in a suicidal enterprise.

There is as yet no serious economic controversy, though traders, artisans, and farmers, under the pressure of difficulties, not unnaturally complain of foreign competition. Many of them would nevertheless hesitate to accept the sole alternative of Protection, even if it were not hopelessly beyond their reach. In his eagerness to insult his political opponents, Mr. BRIGHT blunders into a flagrant misrepresentation of the causes of distress. It is true that a series of bad seasons has been almost ruinous to agricultural industry, with the ulterior consequence of diminishing largely the home demand for all products of industry. It is nevertheless absurd to pretend that foreign tariffs have had no share in discouraging manufacturing enterprise. When almost all civilized countries are doing their utmost to prevent the importation of English goods, it would be strange if they wholly failed of their object. Mr. BRIGHT's opinions are in this respect largely affected by feelings of predilection and dislike. He hates English Tories, but he has no alien antipathies. It never occurs to him that Russia, America, Germany, and several English colonies belong to the baser sort of nations because they maintain Protection on a scale which Fair Traders have never contemplated. The gentle and courteous censure which he has sometimes addressed to American Protectionists is converted into passionate spite when he suspects English landowners of a desire to follow the example of Pennsylvanian ironmasters. As a bitter and intolerant partisan, he ought, in consistency, to feel grateful to any section of the Conservative party which strives to render impossible the return of its leaders to office. On one point his opinions happen to be sound; and for forty years he has never ceased to boast of the triumph which he and his friends achieved in the abolition of the Corn-laws. Until lately the effect of his pretensions had been gradually weakened by the conversion of all parties to the truths of free trade. The revival of heresy among the less-instructed class of Conservatives is an un-mixed advantage to the Liberal cause.

It is in its bearing on party politics that the frivolous Fair Trade agitation is chiefly objectionable. There is, for the most part, no serious harm in the public discussion of fallacies which are most effectually exposed when they have become subjects of popular controversy. No long time can elapse before landowners will be convinced that the restoration of any fragment of the old Corn-laws is utterly impossible; and, if imported food is untaxed, the revenue to be derived from other protective duties would be insignificant. Farmers could not be expected to pay artificial prices for manufactured goods, while their own produce was exposed to unlimited competition. The traders who desire to exclude or limit foreign competition are inconsiderable in number and in weight. The real grievance which is generally felt is not that foreign commodities are imported, but that English goods are excluded from foreign markets. English iron-masters and iron-founders would not suffer the less from the American tariff if heavy duties were imposed upon American products. They would, in truth, be doubly taxed, if the price of bread and of meat were raised while the duties on iron and steel remained the same as at present. There can be but few believers in the efficacy of retaliation. The producers who maintain for their own benefit restrictive legislation would derive additional strength from an admission on the part of the English Legislature that they were in the right. If retaliation is ever attempted, it will probably be confined to non-competitive articles, such as wine; and in such cases no relief would be afforded to any domestic industry. There is no danger that the reaction against economic principles should prevail. It is, indeed, unwise to trust to the universal triumph of truth when false doctrines seem to become more and more powerful in almost every foreign country; but truth combined with overwhelming preponderance of force is great and will prevail. No conceivable argument would reconcile manufacturers to taxes on raw materials, or the enormous population of the towns to

duties on food. Those who favour either measure only condemn themselves to political isolation and helplessness.

Before the invention of Fair Trade, reasonable Conservatives and moderate Liberals were gradually approaching to one another in opinion, though the boundaries of party connexion had not been visibly disturbed. Any considerable secession to the ranks of the Protectionists would reopen and perpetuate the division which was fading into a mere imaginary line. Both political sections, if they were united, would not be too strong for the purpose of resistance to revolutionary legislation. Only a few weeks have passed since the enactment of the anomalous measure which purported to find an excuse in the exceptional position of Ireland; and already Scotch farmers have begun to agitate for the arbitrary extension of limited duties to which their claim is strictly defined by the terms of voluntary contracts. The principal organ of the Ministerial party gives currency to proposals for confiscating the whole or the greater part of the property of landowners. Even at the Fair Trade meeting, doctrines which ought to have alarmed the promoters of the League were thoughtlessly propounded. It was suggested that the proposed duty on imported corn would not have been necessary but for the deficient produce of the land as it is divided into large estates. Fair Traders were not likely to know that the gross produce of English land is much greater than that of any country of equal extent. The impending agitation against landowners will rapidly extend to every other kind of property; and there is scarcely an institution in the country which is not seriously threatened. Neither the House of Commons nor the Cabinet is exempt from revolutionary tendencies, and no confidence can be reposed in the impulsive PRIME MINISTER. If the Opposition had a leader like Sir ROBERT PEEL, it would rally by degrees all those who are interested in the rights of property and all friends of the Constitution. A heterogeneous party, composed of all discontented sections of the community, may harass the Government, but it will not be in a position to succeed it. Defiance of economic rules is especially objectionable when the main object of the adversaries of the Government ought to be resistance to interference with private rights. Mr. GLADSTONE has, when it suited his purpose, relegated political economy to Saturn and Jupiter, and he has nothing to fear from those who in another department of legislation arrogate to themselves similar license. The French Legitimists and Bonapartists, who habitually vote with the wildest anarchists for the purpose of embarrassing the Government, have not attained such a degree of success as to render them models for imitation. It would be a serious national evil that the Opposition should, in its conflict with a dangerous faction, commit itself to untenable issues.

#### THE LIVERPOOL COTTON CORNER.

THE English public have become suddenly and painfully familiar with the special dialect of the cotton trade. A week ago there were few people not connected with Lancashire who could have defined the difference between "spot" cotton and "futures." To-day "futures," at all events, have become a household word with vast numbers who are either patiently looking forward to inevitable losses or calculating how much they will have to endure in order to bring these losses to an end. The question has even a more universal interest, by reason of the possible extension of the corner system to still more necessary trades. It is bad enough when the supply of cotton is artificially restricted, and the mills of Lancashire are forced to stop working, in order to bring those who have restricted it to their knees. But, supposing the plan of stopping the mills to answer, it has the great merit that it can be tried. England will not be materially the worse if for the next seven or fourteen days no more cotton is spun or manufactured. But what would be done if the corner, instead of being in cotton, were in corn or in some drug universally used and absolutely irreplaceable? The eaters of bread could not stop the consumption for a week or fortnight. The sick people, to whom such and such a medicine is a matter of life and death, would have to buy it until their means of paying for it were exhausted. To all appearance, therefore, the success of the corner man in either of these instances would be complete. The

whole supply of an article of absolute necessity would be in his hands, and he would be able in consequence to charge his own price for it. This is a perfectly possible contingency; indeed, as regards corn it has once or twice been on the eve of occurring. Consequently the sympathy of the public with the cotton-spinners is of the acutest and most personal kind. The conspiracy they are resisting in Lancashire is identical in kind with those which may hereafter have to be resisted in all parts of the country. Unfortunately, for the reason just assigned, the experience of the cotton-spinners is only indirectly available for other trades. The immediate effect of the closing of the mills cannot be reproduced in the corn trade or the drug trade. There the manufacture of the article must go on, whether the supply of it be abundant or short, and whether the price be normal or extravagant. It is to the effect—if there be any effect—of the collateral agencies which the Lancashire spinners may be able to bring into play that the public will look with most interest, because it is these agencies alone that can by any possibility be invoked in the analogous cases.

What a corner is, is very easily understood when once the term has been explained. The same man, or the same group of men, is at once buyer and seller. He is buyer because he has contracted for the delivery to him of all the cotton, or other goods with which the speculation has to do, in existence at some future time. He is seller because he has contrived in the meanwhile to buy up beforehand all the cotton or other goods which will be in existence at that time. Consequently, when the time arrives, and the dealers who have contracted to deliver the cotton go into the market to buy it, they find that it is already in the hands of the man to whom they have agreed to sell it. Of this circumstance, however, the law takes no cognizance. The dealers have agreed to deliver so much cotton to A., and they are bound to carry out their undertaking without reference to the fact that they must buy it from A. in order to have it to deliver. A., therefore, has it in his power to put up the price of cotton to any point he likes—subject, of course, to the proviso that this point must not be so high as to make the cotton absolutely unsaleable. The present endeavour of the cotton-spinners is to cause the cotton to become unsaleable at a point below that which the corner man has assigned in his own mind. He has calculated that they will endure a certain amount of loss; that, rather than close their mills, they will go on buying cotton from him, even though the price they have to pay for it eats up all the profit they ordinarily make by selling the yarn to the manufacturers. The spinners have now turned round on him. They prefer to bear their losses in a form which they hope will be fatal to the corner man. It is annoying, of course, to have to stop their mills when the necessity for doing so is artificially created, and to allow the capital invested in buildings and machinery to lie idle. But it is less annoying to do this than to go on working and see the returns accruing from this capital passing into the pocket of the corner man instead of into their own. They have accordingly agreed to close their mills for at least a week, and to buy no cotton in the meantime. In this way they hope to bring the device of the corner man to nought. He has raised the price of cotton, it is true; but of what avail will this be to him when the demand for cotton is suspended? He has bought on unusually favourable terms, but, now that the bargain is completed, he will find that he has only got possession of a commodity which he cannot sell, and which is useless to him so long as it remains unsold.

The worst of this method of retaliation is that the real brunt of it falls on those who are not a party to its employment. The cotton-spinner will not be seriously injured by a short stoppage of work. It will merely ensure a brisker demand for yarn when he re-opens his mill. But the workmen whom the closing of the mill throws out of employment are in a very much less secure position. To some extent, perhaps, they may be recouped by better trade and higher wages by and by; but against this chance must be set the unpleasant certainty that they will have to live for a week or a fortnight on credit or on savings which have both been heavily drawn upon by the recent trade depression. It is certainly desirable that this process, however necessary it may be for the moment, should not remain the only method of defeating the corner man. It inflicts a great deal of undeserved suffering on a class which is in no way

responsible for the corner man's misdoings, and it cannot be applied universally. The best cure for speculations of this kind is to be sought in more stringent rules of business, in greater publicity of transactions, and in sharper and more effective expressions of trade opinion. It may be contended possibly that cornering is a legitimate process, and that there is no need to take fresh precautions against it. As regards this plea, it is hard, no doubt, to say what is and what is not a legitimate process when trading on a large scale; but whether cornering be so or not, the excessive inconvenience which it causes supplies a quite sufficient reason for putting it down.

There is no need to go into the morality of cornering. We will assume that the corner man may look at smokeless chimneys, silent spindles, and starving operatives, may know that this is all his work, and may yet feel that he has not the slightest reason for being ashamed of what he has done. But even the exercise of our virtues may have to be restrained if it causes inconvenience and suffering to our neighbours. Irreproachable as the corner man may be from a moral point of view, he is highly inconvenient from an economical point of view, and that is ample justification for limiting his freedom. The Committee of the Liverpool Cotton Brokers' Association ought not to find it a very difficult matter to frame rules which should head the corner man at some point or other in the long series of steps by which he carries out his end. Some method of registration of purchases might be devised which should make it evident whether any unusual amount of cotton was coming into certain hands, and so warn the dealers who have contracted to deliver futures at this or that date to lose no time in obtaining the means of fulfilling their contracts. It is hardly probable, however, that if public opinion goes on condemning cornering with the same decision which it has lately shown, speculators of the class to which corner men ordinarily belong will continue to practise it. Everything, of course, depends on the consistency with which the censure conveyed by these denunciations is applied. To take a very obvious instance, a cotton-spinner will call a corner man a swindler, a shoplifter, a robber; but would he refuse to give him his daughter in marriage? Is his abuse the expression of a genuine belief that cornering is an illegitimate and dishonest use of trade opportunities, or merely of natural irritation at the annoyance which this use of them has inflicted on him? In one word, is cornering swindling? If the Lancashire public has made up its mind to say yes to this question, a cornering syndicate will soon become of as rare occurrence as a "long firm."

#### THE WOES OF RAILWAY TRAVELLERS.

THE season of grumbles about the inconveniences of travelling has set in with unusual severity, but with a certain difference. The majority of the complaints which fill columns of the *Times* in September are in ordinary years directed against Continental railways; this year it has been our own railway system which has had to bear the brunt of the attack. There has, of course, been a dropping fire on the foreigner, who, it must be said, as a rule, takes very little notice of it. One Correspondent in particular has drawn a lurid picture of the Lyons Railway, connecting the recent accidents with the corruption of the officials, who, according to him, keep the trains waiting, in order that they may secure higher and over higher bribes for separate compartments, *fauteuils-lits*, and other privileges, which are in turn rendered necessary by the abandoned character and repulsive habits of travellers in the ordinary carriages. But whether it is that, owing to the lateness of the Session, fewer people than usual have yet returned from the Continent, or that the bad weather in August deterred them from going, there has been much less grumbling of this particular class than usual. Very few complaints in particular have been made of what is unquestionably the worst nuisance of Continental travelling, the danger of having luggage broken open and robbed *en route*. This, which is absolutely unknown in England and not very common in France, is of constant occurrence in Germany, Switzerland, and Italy, but up to the present time few victims have complained of it.

On the other hand, there is an almost unexampled chorus of grumbling at the arrangements of the English lines, especially at their arrangements with what may be

called regular customers. The burden was first taken up by a season-ticket holder, and season-ticket holders have continued to furnish the majority of the lamentations; but the minority has been sufficiently varied. The numerous and vexatious restrictions imposed upon these contract ticket-holders, the reluctance to meet them halfway in regard to occasional journeys beyond the limits of their contract, the rapacity with which any oversight is punished by the impounding of deposits and the charging of ordinary fares in default of punctual renewal—all these old and well-known complaints have been repeated in every possible variety. A great chorus of wailing has also been set up over the unpunctuality of the service; and here, as usual, the two chief Southern Companies, with London and Brighton as a good third, come in for a greater part of the blame. Several novel points—points of considerable importance to the persons concerned—have been introduced into the discussion, owing to the immense extension of suburban traffic of late years. There is one question, in particular, which seems to cause more heart-burning than any other. The fares to and from stations on the different lines round London are, as every one knows, arranged in batches—that is to say, the charge is the same from any one of a considerable group of stations to any one of another considerable group. But some Companies, if not all, have a strong objection to allowing the return-ticket holder to have the benefit of this arrangement, and insist on the article of their by-laws which states that a ticket is only available to or from the stations named on it. The point has more than once come before the courts of law, with varying results; though we believe that in the highest court to which it has yet been taken in any particular case judgment was given, on the ground of express contract, in favour of the Company. On the other hand, the balance of decisions is decidedly against the Railway Companies on another point very dear to them, the freedom from liability which they claim in case of loss arising from unpunctuality or failure to meet corresponding trains. It is argued, moreover, that many of the regulations, and more still of the practices, of the Companies are altogether *ultra vires*, such as the compulsory clipping of tickets, the refusal to recognize a ticket issued for one train as valid for another, and so forth. Lastly, there is the wide subject of insufficient arrangements for the comfort and convenience of passengers. With regard to actual comfort, a good deal of progress has been made—at least on the Northern and Western lines—in the last few years. But it is still impossible, save on a few rare occasions, to get tickets except by struggling at a window in a limited time and space. There is still an entirely arbitrary power exercised of disarranging and postponing ordinary traffic in favour of profitable extras, such as race trains and the like, at fares which are very nearly, if not quite, illegal. Above all, there is still the absence of the most rudimentary attention to convenience, and even safety, in the matter of luggage. We have said that the English porter or guard rarely emulates his German and Italian compeer in the practice of actual robbery. But it still needs not a little vigilance on the part of the traveller, unless he wishes that, in the words of an old burlesque, "his carpet-bag shall be at Bath, his trunk at Jericho"; and the arrangements for delivery of luggage at the end of a journey are still almost incredibly insufficient. Luggage robberies at the terminus are sufficiently common; the only wonder is that they are not much more frequent. As soon as the train stops, the luggage is disgorged on the open platform from probably three or four different parts of a long train. Sometimes the formality of drawing movable rails round it is observed, and in a few cases numbered check tickets are given; but even then the nearest porter inside is sure to have entire faith in the statements of the first claimant outside. There must be very few people at all accustomed to railway travelling who have not arrested something of their own on its way, perhaps by mistake, perhaps by intention, to somebody else's cab.

As usual, the railway companies, in the exercise of the wisdom of their generation, hold their peace. They know that the grumblers are almost powerless, and that in a short time they will have something else to do than to grumble. If any answer beyond a mere red-tape one is ever attempted, it is of the kind which report ascribes to Sir EDWARD WATKIN on a recent occasion at Hastings. That Cinque Port is a notoriously aggrieved one in the matter of railway service, and it has found the Railway Commis-

mission but a rotten reed. Sir Edward, on a public occasion, seems to have been mildly reproached by the Mayor, and to have replied softly, but with a gentle reminder that he himself and his relations held more stock in the South-Eastern Railway than all Hastings put together. The oddity of this argument, if it was really used, for which of course we cannot vouch, is exemplary. It is as if a tradesman, being remonstrated with for the bad quality of his ware should reply, "Sir, I am very sorry, but you must reflect that I have a greater interest in conducting this business for my advantage than for yours."

Of course the reason why the tradesman does not make a retort, while the railway director does, is that the former has the fear of competition before his eyes, and the latter has not, except in a few cases—in which cases, it need hardly be said, he takes very good care to meet complaint, or rather forestall it, in a very different spirit. The great towns of the North and the Midlands are almost all served by several different Companies. There is therefore brisk competition between these—not, indeed, in the old ruinous spirit of folly which made it possible at one time to travel first-class from London to Liverpool for five shillings, but in the provision of the quickest, most punctual, most comfortable, and most convenient service possible. At this moment Manchester can be reached from London by any one of four of the greatest trunk lines in the kingdom; and the consequence is that in the Midland and the North-Western express trains almost every possible improvement has been introduced. The traveller, even in the cheaper classes, is comfortably seated, can depend on swift and punctual travelling, has for the most part his luggage close at hand in a compartment of the same carriage, and is even furnished with most of the advantages of saloon or Pullman cars. On the other side of London things are changed. There the only competition is for the through Continental traffic, and this is, accordingly, the only class of passenger traffic that is looked after. As for Parliamentary interference, it is theoretically quite justifiable, because of the exceptional position in which railways as trading corporations are put by their Parliamentary powers. But it is very difficult to procure, owing to the strength of the railway interest; and it is not clear that it would be really effectual. The proposed Railway Passengers' Defence Association—a very old proposition, often renewed but always dropping through—might, indeed, do some good by restricting the present undoubtedly illegal encroachments of the Companies and enforcing compensation in every case of breach of contract. But it would not be very easy to organize it, in the first place, and it would in all probability be still more difficult to keep it together.

#### THE HOME OF JOHN BUNYAN AT ELSTOW.

IT was no doubt wrong, but it was very natural, that, in spite of Bunyan's undeniably modern date, a large portion of the attention of the Archaeological Institute, at their recent meeting at Bedford, should be devoted to him; and that Elstow, the place of his birth and his home for the first thirty years of his life, should be a leading object in the excursions. Even Dean Merivale had to devote several paragraphs of his address to the local hero. As every one who made a public harangue at Athens must sing the praises of the goddess Athene, "so," the Dean remarked, "any one speaking in Bedford must magnify him whom we might almost call the patron saint, the pride and glory of the town, the famous John Bunyan." Besides the Dean's address, two of the memoirs read at the meeting were devoted to the same absorbing subject; that of the Rev. John Brown, minister of the chapel that bears Bunyan's name, on "Recent Memorials of Bunyan"; and that of the Rev. James Copner, vicar of Bunyan's native parish, on his "Connection with Elstow." The former paper presented much that was new, the result of Mr. Brown's own painstaking investigations. Mr. Brown showed that, so far from Bunyan being of gipsy descent, as an ingenious American writer has endeavoured to prove, the name Bunyan, in one of its many forms, had been already known in Bedfordshire for full seven centuries, first appearing in the chronicle of Dunstable in 1219, and was repeatedly found in the Records of the Court Leet, the Registry of the Court of Probate, the accounts of the Guild of the Holy Trinity at Luton, and other mediæval documents, as well as in the parish registers of Bedford and other places in the county. "The Bunyans of Elstow—where they were living as early as 1603—appear to have been the poor retainers of a family other branches of which were substantial yeomen in the county quite three centuries ago." The annual parochial returns of the Archdeaconry of Bedford, now for the first time examined, have supplied many hitherto unknown names and dates connected with the Bunyan family. Both

the father and grandfather of John Bunyan were named Thomas. The former was baptized in February 1603 at Elstow Church, where, four-and-twenty years afterwards, May 23, 1627, he took for his second wife one Margaret Bentley, John Bunyan's mother. John himself was baptized at Elstow, November 30, St. Andrew's Day, in the following year, 1628.

Mr. Brown has discovered that Bunyan lost his mother when he was between fifteen and sixteen years old, and that the congregation of which the "holy Mr. Gifford," once a debauched Royalist officer, was pastor, to which Bunyan joined himself and of which he became pastor in 1672, used St. John's Church as their place of worship till the reinstatement of the Rev. Theodore Crawley, who had been ejected by the Puritans, after the Restoration in 1660. Mr. Copner's paper contained little that was new beyond some fresh *scintille* of evidence in support of his theory—ably, and we think effectually, combated by Mr. Brown, and discredited by Mr. Edward Peacock—that Bunyan was at heart a Royalist, and that his seven months' soldiering was passed under the standard of Charles I., and not of the Parliament, and that he was not more than seventeen at the time of his marriage to his first wife, when, without "so much household stuff as a dish or spoon between them," the young couple began to occupy the cottage at Elstow ever since coupled with Bunyan's name.

Elstow, John Bunyan's birthplace, is a little village of old-fashioned, half-timbered cottages, with overhanging stories, projecting porches, and gabled dormers, covered with clustering roses and honeysuckles, clustering round the village-green. The pedestal and stem of the ancient market cross breaks the sward, and at the upper end of the green stands the Moot Hall, a picturesque brick and timber building of the end of the sixteenth century. The church, which rises somewhat shapeless, but not altogether undignified, on the south side of the green, is a mere fragment of that of the nunnery founded here in 1078 for Benedictine nuns, by Judith, niece to William the Conqueror, in vain atonement for the base part which she, a second "Herodias" or "Job's wife," as the Anglo-Norman Chronicle calls her, had borne with traitorous and lying tongue in the judicial murder of her husband Waltheof, Earl of Huntingdon—the greatest crime, and, we may add, the greatest blunder, in the Conqueror's life. Elstow, or according to the ancient form found on the conventual seal, "Ellenstowe," like Bridestow, Morwenstow, Edwinastowe, and other similar names, takes its designation, the *stow* or place of St. Helen, from the original dedication of the church in Saxon times to St. Helena, the mother of the Emperor Constantine. The Church of Rome, with her all-absorbing centralization, has ever shown herself as unfriendly to local saints as to provincial liturgies or national uses. Thus St. Guthlac was almost buried at his own Crowland beneath the later names of St. Mary and St. Bartholomew. St. Peter took precedence of St. Wilfrid at Ripon and of St. Etheldreda at Ely, while his brother apostle St. Andrew was placed before St. David in his own Cathedral of Menevia. In this way the old Saxon chapel of St. Helen became the Church of St. Mary of Elstow, which in due course had to give way at the Reformation to "the Holy and Undivided Trinity."

Elstow Church, in which John Bunyan was baptized and married, and where for many years he worshipped, regarding, as he tells us, with an almost superstitious reverence the "High Place," and all belonging to it, "priest, clerk, vestment, service, and what else," in the early days of the "Directory," is the nave of the original nunnery church, preserved at the Dissolution for the use of the parishioners, whose church it had doubtless always been, when the conventual portions were pulled down by the grantees, Sir Humphrey Ratcliffe. This was the most usual mode of dealing with monastic churches in which the parishioners had joint rights with the conventual body. The choir and transepts, with the central tower, where there was one, were pulled down by the grantees, and the materials sold or employed to erect a mansion-house hard by, while the nave was left standing. Examples of this are abundant in every part of England. It is sufficient to name Lanercost, Bridlington, Binham, Dunstable, Leominster, Waltham, and Malmesbury as typical instances. Sometimes, but much more rarely, as at Pershore, Hexham, Boxgrove, and New Shoreham, the arrangement was reversed, the parishioners becoming possessed of the eastern part by purchase or gift as their parish church, the nave, their original place of worship, being destroyed. Where the whole church is left, it is either that, as at Great Malvern and Selby, the parishioners bought the conventual church, no part of which had ever been parochial, and deserted their old parish church, which had stood quite distinct; or that, as at Sherborne, Tewkesbury, Dorchester, and other places, the church having been originally shared between the two bodies, the parishioners bought the monks' church and added to it their own. One more class remains, containing, as far as we know, only Ewenny and Dunster (not to dogmatize about Arundel), where the eastern limb was simply allowed to stand, but regarded as completely distinct from the parochial portion, and allowed to fall into disuse, and consequently disappear.

What remains of Elstow Church is Norman of a very rude type in the eastern part, succeeded by four Early English bays of much better character towards the west, the building having, as usual, grown from the altar end westwards. It has a lofty clerestory, with good shafted lancets at the west end. The absence of a blocked transverse arch at the east end, such as we have at Waltham Abbey and other similarly truncated buildings, seems to indicate that we do not see the whole of the structural nave, but that the conventual

choir having, as usual in Norman churches, stretched over one or more bays of the western limb, these bays were included in the Royal grant and perished with the rest. Analogy would lead us safely to assert that there must have been a central tower. The existing detached belfry, the scene of Bunyan's exploits as a bell-ringer—the fourth being that which tradition asserts to have been his favourite bell—as well as of his graphically depicted struggles of conscience, when, having been convinced of the sinfulness of the amusement, he could not refrain from going to look on till forced to flee for fear that first the bells and then the steeple should fall on his guilty head—may be the result, as at Wyomondham, of some forgotten dispute between the nuns and the parishioners, or be merely, like the similar towers of Blyth, Shrewsbury, Christ Church, and elsewhere, the result of a natural desire for independence. Why it stands where it does, full seven yards from the north-west corner of the church, instead of being as usual attached to the west end, we can hardly hope to determine. Perhaps the ground to the west on which it would have been built belonged to the convent, and the ladies refused to come to terms. The tower is a massive structure, of late Perpendicular date, with widely-spreading buttresses. The rough flagged floor of the belfry, bearing the marks of Bunyan's hobnailed boots, together with those of generations of ringers before and since, happily remains undisturbed, and we can only hope may escape the sweeping restoration which is now threatening to carry away much that is most characteristic in the church itself. Repair was certainly needed. Portions of the building were absolutely dangerous, and menaced a speedy ruin. The interior had a most dreary neglected air, with whitewashed walls, and blocked up or broken windows, and square deal pews lined with fusty green baize. Dirt and squalor prevailed. When, however, we read of the removal of the roof, the pulling down and rebuilding of the clerestory and aisle walls, and the complete gutting of the church, we confess that we tremble lest we should get a new church for an old, with all reminiscences of Bunyan effectually wiped out. The advertisement by an enterprising book-selling firm of an "Elstow" edition of *The Pilgrim's Progress*, literally "bound in boards" made of the oak of Elstow Church, made us fear that the old seats, including Bunyan's own bench, had been cast out as so much rubbish. We are, however, glad to be assured that these are safe, and that it is only the timbers of the roof that have been thus strangely utilized. The lovely little fourteenth-century apartment, groined from a central shaft, attached to the west end of the south aisle, popularly known as the "Nun's Choir," and sometimes, but erroneously, supposed to have been the chapter-house, is, we are told, receiving careful treatment, the injured vaulting being restored stone by stone. The singular moulded brackets connecting the vaulting ribs with the capital in this room are probably unique. Their loss would be irreparable.

To the south of the church the remains of the Jacobean mansion of the Hillesdens, pieced on to the walls of the nunnery, with their ivy-draped mullioned windows and little domestic chapel wreathed with foliage, form a very picturesque feature. It must have been a grand new house in Bunyan's early days. The cottage where Bunyan was born cannot be identified. That occupied by him after his first marriage, where his children were born and the fierce spiritual conflicts were waged, narrated in his *Grace Abounding*, is pointed out, but alterations and repairs have made it essentially a modern building. Here in the time of the late Dean Bowers of Manchester, who was formerly Rector of Elstow, the very forge used to be shown at which Bunyan worked. This, too, has now passed away. Bunyan was living here in April 1654, when his daughter Elizabeth, who died in childhood, was born. Between that year and 1660 he must have left his native village, and gone to reside at Bedford, where he is stated to be living in his indictment of that year. The site of the house in Outhbert Street in which he resided after his release in 1672 till his death is still pointed out. As is well known, twelve years of Bunyan's Bedford life were spent in gaol, at one time making tagged laces for the support of his family, at another writing the work which, little as he could then have anticipated it, has been translated into almost every language of the civilized world—the Bunyan Library contains a translation into Chinese with Japanese illustrations—and has made his name immortal. This gaol, the "Den," as he calls it in the opening words of his *Pilgrim's Progress*, was not, as sensational writers have loved to represent it, the damp and stifling dungeon on the central pier of Old Bedford Bridge, which was nothing more than a mere town lock-up for casual vagrants, but in the county gaol standing between High Street and Silver Street. This has now been pulled down, and its site has become an open market, and only a small fragment of its side wall remains for the gratification of pilgrims. "Bunyan Meeting" contains a curious museum of miscellaneous articles, such as his apple scoop, penknives, scales for testing the weight of the coins paid him, a curious little cabinet with nests of drawers, and the solid oaken chair with carved legs in which he used to sit. The most interesting of these memorials is the "Church Book," containing the records of the Baptist congregation of which Bunyan had been appointed pastor on the 21st of January, 1672, the year of his liberation from his twelve years' imprisonment. His formal pardon under the Great Seal was not issued until the 13th of September of that year. But on the 9th of the preceding May he had received a license to preach, among about three thousand other Nonconformist teachers, and during this interval his incarceration was merely nominal. This year is celebrated in the annals of Nonconformity as "the year of Liberation." The

Oabel Ministry were preparing for a new war with Holland, to avenge the insults and injuries of 1666. Though they had no love for sectarians, it was expedient to conciliate them, that the difficulties of a foreign campaign might not be aggravated by internal dissensions. So the famous "Declaration of Indulgence" was published by Royal authority; and, in Mr. J. R. Green's words, "ministers returned after years of banishment to their houses and to their flocks; chapels were reopened; the gaols were emptied; Bunyan left his prison at Bedford, the 'Den' where he had been visited with his marvellous dream." The first entry in the "Church Book" is not dated at Bedford, but at the neighbouring village of Gamlingay, where, before his imprisonment, Bunyan had laid the foundations of a congregation, and records the propounding of the desire of "Sister Behemon" to walk in fellowship. As the contrary is not stated, we may conclude that the desire of the fair sister—whose name, so quaintly suggestive of the huge water-beast of the Book of Job, is merely a phonetic form of Beaumont—was granted. A subsequent entry, however, the first in Bunyan's own handwriting, tells us how "at a full assembly of the Congregation was with joynt consent of the whole Body cast out of the Church John Rush of Bedford for being drunke after a very beastly and filthy manner, that is"—the definiteness is worth remarking—"above the ordinary rate of drunke; for he was not carried home from the 'Swan' to his own house without the help of no less than three persons, who when they had brought him home could not present him as one alive to his familie, he was so dead drunke." This Church Book, kept continuously down to the present day, abounds in curious entries throwing light on Nonconformist religious life. We are surprised it has not been printed.

Another interesting document among the Bunyan papers, the only holograph known, is what is erroneously known as "Bunyan's will." It is dated December 23, 1685, the year of Monmouth's rebellion, and is really a deed of gift to his wife Elizabeth, executed when he thought he should probably have to go to gaol again for suspected complicity in Monmouth's designs, with the forfeiture of all his little property. In this, describing himself as "J. Bunyan, of the parish of St. Outhbirts in the toun of Bedford, *Brazier*," he makes over to her "all and singular my goods, chattels, debts, ready money, plate, rings, household stuffe, apparel, utensills, brass, pouter, bedding, and all other my substance whatsoever, moveable and immoveable." The "one coynd pece of silver commonly called twopence," which, as a *cayarra* or handsell, had been affixed to the seal to put Mrs. Bunyan "in peaceable and quiet possession," has unfortunately been lost. Bunyan's fears of further annoyance proved groundless; and, though he was sometimes driven to adopt disguises to escape threatened danger—the tradition is that he used to go to Reading to preach in a waggoner's frock, with a long whip in his hand—his liberty was never again restrained, and he lived unmolested to within three months of the Revolution. As is well known, he died at the house of a friend, Mr. Strudwick, a shopkeeper on Holborn Bridge, August 31, 1688, of a cold and fever caught in a wet ride from Reading, where he had been to reconcile a father and son. By a happy chance, Mr. Brown has secured one of the worthy tradesman's bills, made out to "Lord James Radcliffe"—afterwards the Lord Derwentwater who suffered in 1716—with a woodcut of the four-storied gabled house, such as the older of us can remember many of in the back streets of London, in which Bunyan died. The billhead runs:—"Bought of John Strudwick, at the sign of the Star, Holborne Bridge, Grocer and Chandler." The copy of Foxe's *Acts and Monuments*, or *Book of Martyrs*, as it is popularly called, which was Bunyan's companion and daily study in prison, is preserved in the Town Library. Bunyan's signature at the foot of the title-page is laboriously formed in large ill-shaped printing characters, with the date 1662, the work of one by whom the art of writing, if he had ever acquired it, had been almost entirely lost. The margins of some of the ghastly woodcuts of burnings, &c., are scrawled over with rude doggerel rhymes such as the following:—

Hear is one stout and strong indeed;  
He doth not waver like as doth Reed.

Certainly Bunyan improved greatly both as a penman and a poet before he wrote "The Deed of Gift" already described, and composed that little lyrical gem in the Second Part of *The Pilgrim's Progress*, recalling Amiens' song in *As You Like It*:—

Who would true Valour see  
Let him come hither;  
One here will constant be,  
Come snow, come weather.  
There's no Discouragement  
Shall make him once relent  
His first avowed Intent  
To be a Pilgrim.

#### THE LOGIC OF THE FARMERS' ALLIANCE.

AT last the Machiavellian policy of Mr. O'Donnell has fully succeeded; and his outlay in preparing the cradle, and, so to speak, paying the christening fees, of the Farmers' Alliance at the Westminster Palace Hotel has come back to him with an abundant usury. The Farmers' Alliance has declared for an English Land Bill, and Mr. W. H. Gladstone has, by an interesting coincidence, endorsed the declaration. The political eminence of the Prime Minister's eldest son, despite the elaborate arrangements

for politically educating the house of Gladstone which were detailed the other day to a correspondent by the head of the family, has not hitherto been great. But perhaps Mr. W. H. Gladstone is going to make up for lost time. It is not interesting to act the part of Hector, and amiably ejaculate, "Well fought, my youngest brother!" unless it is quite certain that the difference between Hector and Troilus is properly recognized by the spectators. Mr. W. H. Gladstone has therefore taken a leaf out of his junior's book, and has bettered the instruction, as, indeed, the nation has a right to demand from a man on whom it has actually spent considerable sums—while it has Mr. Herbert Gladstone on the easy terms of what is, we believe, called in trade an "improver." "There is to be a Land Bill for England," says Mr. W. H. Gladstone boldly. "It is resolved that a model Land Bill for England shall be at once prepared," says the Farmers' Alliance. We shall consider the probable contents of such a Bill, as shown in the other resolutions of the Alliance, immediately; but any one curious on the subject may be recommended to look at the comments which the programme has already drawn forth from the Radical press. The general spirit of those comments could not be better put than in the language (also happily contemporaneous) of a certain Mr. Murray, of whom we know nothing except that he spoke after Mr. Sexton at a Land League meeting in Dublin the other day. "Irish lords," said Mr. Murray, "gulped down salmon and trout while their tenants were starving. Landlords were devils." This extremely succinct statement of the question was greeted with cheers; and it seems (at least the latter part of it) to express the feelings of the Farmers' Alliance most accurately. Not being Irishmen, they probably do not suspect any actual duke of gulping a salmon weighing, let us say, thirty pounds. But that landlords are devils sums up the gist of debates, letters, leading articles, and descriptive articles on the subject with admirable force and precision. The attitude of tenants who complain that it is not quite certain whether or not they may let the shooting allotted to them under the Ground Game Act to sportsmen, is of itself a matchless comment on that egregious measure. But the general position of the appetent agriculturist could not be better appreciated than from a certain series of articles which have appeared in the *Daily News*, headed "Dilapidated Husbandry." There is no reason to believe that matters of fact are in the least tampered with in these articles; and the writer's good faith, combined with his firm belief in the "landlords are devils" principle, blinds him in the most agreeable way to the delightful inconsistency of his objections to their devilry. This correspondent finds fault with one landlord because he turns tenants out, with another because he keeps them in. To dismiss a farmer who is unwilling to pay a high rent, and to keep an old servant who cannot spend capital on his farm at a low one, are equal crimes. The writer, however, is most valuable, because a good deal of side-light on the Farmers' Alliance programme is obtainable from him. It seems that the farmers will be good enough not to claim an immediate price for their "goodwill." This, considering that every single farmer in England (with the exception of a few districts in Lincolnshire and perhaps elsewhere, in which it is not pretended that the custom has been infringed) knows himself, on entry into his farm, to be a tenant either at will or for some given period, without the faintest presumption of fixity, may be said to be extremely generous. But what the farmers would like to do is to secure, if not fixity of tenure, at any rate free sale in the following roundabout fashion. They wish to have unlimited right to compensation for improvements; and as it may be inconvenient for the landlord to pay down at a moment's notice whatever a lavish and unskilful tenant chooses to say that he has frittered away on the land, with allowance for the increased value of the land so improved, the outgoer is to be empowered to sell this his "interest." As any one may see, the full tenant-right just granted to Irish farmers is practically included in these two propositions, as far as free sale is concerned, and free sale is beyond question the most important of the three F's.

However, let us go to the Farmers' Alliance itself and its programme. Four resolutions were passed by it last Monday. The first had reference to the drafting and bringing in of a Land Bill for England and Scotland, as just mentioned; and the second completed this by suggestions as to a deputation to Mr. Gladstone, who, by the way, on Mr. Murray's principles, is a "devil" himself. The third resolution is a long one. It has reference to the new cry for Protection, and deals with that subject in the most orthodox Free-trading language. The Alliance, or at least its Committee, thinks that return to Protection is impossible; and, if possible, would hurt agriculture more than anything else, inasmuch as the corn duties would be sure to be repealed at the first convenient moment by either party in want of a popular measure or a cry. It points out that duties on foreign corn would interfere with stock-farming, and that the proposal is really a proposal for keeping up rents. All this is, as we have said, of the purest Free-trade orthodoxy, and it is only at the extreme skirt of the resolution that the least little cloven hoof peeps out. The cry for Protection, it seems, is bad in itself, but it is worse inasmuch as it "postpones the demand for agricultural reform," which, to go back to resolution number one, is "imperatively called for, owing to the prolonged depression in agriculture, followed by another disastrous harvest." By the way, the harvest is turning out by no means so disastrous as it suits folk of this sort to pretend; but no matter. Lastly, the Committee expresses its sympathy with the farmers in Aberdeenshire

in the efforts made to obtain a reduction in rents and a Land Bill for Scotland, and "thinks them for their spirited action." Mr. Bright has since added his congratulations to the Aberdeenshire heroes. The spirited action in question, it must be remembered, has in some cases taken the form of a refusal to pay any rent whatever unless a reduction of five-and-twenty per cent. is granted. This obviously adds fair rent to the catalogue of reforms with which the Alliance sympathizes, and which it considers to be imperatively demanded by some years of agricultural depression and an additional disastrous harvest.

We are accustomed to public and private ignorings of that proverb about gander and goose which some refined persons think so terribly vulgar. But we really do not know that a more naïf and innocent enunciation of the contrary principle has ever been published than this interesting document. It consists, as we are frequently told that all works of literary art should consist, of a beginning, a middle, and an end. The middle is made up, as we have seen, of a learned, elaborate, and orthodox renunciation of Protection and all its works; the beginning and the end, of a passionate demand for the very same protection, only applied in a slightly different way and for the benefit of different persons. "Do not," pleads the Farmers' Alliance, "ask the Legislature to protect this great native industry by artificial devices of taxation, violating the principles of political economy. They will not do you any good. The money will simply come out of the pocket of the nation at large, and, what is more, it will go into the pockets, not of you, but of the persons whom Mr. Murray, of Dublin, calls the devils of landlords." Much admirable argument supports this plea; and if the listening farmer confined himself to resolution number three and hearkened to it, he would doubtless go away convinced that artificial legislative devices cannot fight against the laws of nature, and that he must make his bargains in the open market, take his chance of bad seasons and competition, and trust to stout work and the survival of the fittest, just as his shoemaker and his tailor do. But the Alliance does not dismiss him with such cold comfort as this. "You shall have protection," it says, "only it shall be protection of a different kind. You shall be shielded against the laws of supply and demand, and a legislative sliding scale shall make you impervious to the worst of seasons. It is the devils of landlords that shall pay for all this, and therefore the nation won't object, as it would to taxes on its food." We are bound to say that there is a modest want of explicitness about the programme in this part of it. The beautiful arguments which have just demonstrated the folly and injustice and impossibility of one sort of protection are not applied to prove the justice, wisdom, and efficacy of the other. It may, indeed, be extremely inconvenient for the Farmers' Alliance that they should be so applied; yet we shall take the liberty of applying them. In the first place, the proposed scheme, whatever it may be, will be, and must be, protection pure and simple—that is, the artificial favouring of one class at the expense of another, and eventually of the whole nation. During the last five or six years there has been commercial as well as agricultural depression, from which almost every trade and industry has suffered. There is one in particular which supplies an almost exact parallel to the farmers' case. Cornish miners have been half ruined owing to the increasing cost of mining and the drop in the price of tin through foreign competition. It is said that thirteen thousand miners have emigrated from that single county during the last decade, and hundreds of mines have been stopped just as hundreds of farms are now lying tenantless. On the principle of the Farmers' Alliance the Legislature must step in here. It must not, indeed, put a duty of so many pounds a ton on foreign tin, because the consumer would not like that; but it must arbitrarily reduce the royalties, entitle working companies to compensation from the owners in case of unsuccessful operations, &c., &c. So it must be with every interest all round—except the interest of the landowner, and in the long run, of course, of the "bloated bondholder," fundholder, shareholder, and their likes. Out of these devoted people's property bonuses are to be successively handed to all workers too lazy, too unskilled, too thriftless, or too imprudent to get on. This, of course, is not Protection; perhaps it is Fair-trade? but, whatever it may be called, it is clear that almost every objection which lies to Protection pure and simple lies to it, and others besides. Indeed the two things have already been united by some enterprising politicians at the Antipodes, and perhaps the bright spirits of the Farmers' Alliance have been fired by the example of Victoria, insufficiently as the anti-squatter Protectionist policy has there been carried out. At home, however, the farmer must be a much duller person than he is supposed to be if the ingenious plan of Mr. Howard and his friends succeeds in gulling him. He will probably say that, if he is to be protected at all, he would rather be protected in a form which will at any rate not hurt his moral conscience, whatever it may do to his economical one. We do not believe that, in whatever ill case they may be, the farmers of England are, as a rule, disguised Dick Turpins, with a design on their landlords' pockets. The plan of the Farmers' Alliance, as has been pretty fully pointed out, is nothing more than an ingenious combination of Protection with larceny. It could only succeed at the expense, in the first place, of the landlords, and, in the second, of the consumers generally, who by degrees would find added to the three profits the fourth profit of interest on an artificially created value of tenant-right. But it would have this disadvantage, that while, as the Farmers' Alliance very justly points out, a corn duty, if imposed,

could be taken off again, the tenant-right burden, once imposed, is (without a revolution) a millstone for ever—as has been amply proved in Ireland itself. On the whole, the Alliance would probably have done better to hold its tongue about Protection.

#### A PLEA FOR ASHBURNHAM HOUSE

AMONG the very last utterances of the late Dean Stanley were expressions of anxiety for the fate of Ashburnham House. It is to be hoped that one of the first cares of his successor will be its preservation. It is no secret that the clause under which it is to be surrendered to the School was a surprise to the Chapter. It was put into the Act without their observing it. No doubt, some blame attaches to them or to their lawyers for such an oversight. But the present state of the case, pending whatever action may be taken by the new Dean, may be briefly stated as one in which not only has nothing decisive been done, but the little that has been done is, on the whole, favourable to the chance that Ashburnham House will be preserved. In fact, it is rumoured, and even asserted, that all arrangements between the high contracting parties had actually been amicably made, when the unfortunate meeting of "old Westminsters" took place, and an agreement was prevented. It is to be remarked that this self-constituted committee of old Westminsters was by no means representative. Many former scholars dissented from the proceedings, and it is well known that some of those of whom the School is most justly proud do not hesitate to express themselves very strongly against the scheme. Among those who thus stand aloof from the proceedings of the old Westminsters, a single individual may be named, since his opinion alone will by some be thought sufficiently important to decide the question. That Mr. Poynter, R.A., is understood to refuse to join the opposition to the Chapter is in itself a strong argument. The alternative is disagreeable enough. Any one who takes the trouble to look at what the School authorities have made of the noble apartment ceded to them over the east cloister will be sorry that they should be allowed to touch the venerable remains of the monastic *hospitium*, now in the occupation of Canon Leighton. At the same time, by care, and the appointment of a competent architect, or by the Dean and Chapter insisting on the employment of their own architect, the interior changes may be carried out so as to do little injury to the ancient walls. Such a building as that just completed at the opposite side of Dean's Yard would be more than a local eyesore. It would be nothing short of a national misfortune. The preservation of every old stone of Westminster Abbey and its precincts is a matter in which every Englishman is concerned. And, if the School takes possession of Canon Leighton's house, there will be many apprehensions as to the treatment likely to be bestowed on the ancient range of buildings of which it is the chief relic. In fact, whichever way we turn, we are confronted with difficulties—difficulties which have all their origin in one point, that we are interfering with the ancient Abbey, or, in other words, with the fabric of the one building in England on which every Englishman looks with pride and solicitude.

It is true that Ashburnham House was itself originally just such an interference with the fabric of the Abbey. There is a close connexion between it and the south cloister. The garden wall, with its Norman arcading, is the north wall of the ancient Frater. The front wall, facing Little Dean's Yard, follows the line of the old Misericorde. Here the monks, under their easy rule, assembled to eat the supper forbidden, indeed, in the refectory, but, by special grace, winked at in an adjoining chamber. Within the modern house, when we pass from the magnificent staircase into an ante-room, the depth of the doorway betrays the thickness of the ancient wall through which it is pierced. The architect found it easier to include such a wall in his building than to pull it down. Indeed, perfectly novel in its design as Ashburnham House appears, it is in reality a remodelled house of older origin, an origin worth tracing. In 1533 the Abbot's chair was vacant. For some reason which has not transpired, but which may be guessed, no monk of Westminster was deemed worthy of the place, but the Abbot of Burton-upon-Trent, known from his birthplace as Abbot Boston, was brought in to fill it. About the same time three manors were plucked until a sum of 500*l.* should be made up; 500*l.* answers to a very great deal of money in our modern reckoning, and this sum was to be paid to Sir William Pawlet and one Thomas Crumwell, not then so well known to fame as he afterwards became. The new Abbot was the first for three centuries who did not belong to the house, and he acted the part of the hireling shepherd, whose own the sheep are not. When Thirlby was made Bishop of Westminster, Boston was made the first Dean. He "resumed his patronymic," to use a modern phrase, and became Dean Benson. But he had to turn out of the Abbot's House, which was required for the new bishop, and retired, to use Dean Stanley's expression, to "the remoter part of the monastery." This remoter part was none other than Ashburnham House, then, and long afterwards, known as the Dean's House. Here he carried out many "arrangements," which, though they look extremely ill on the page of history, were yet carefully, and, as the end proved, successfully planned, to save some of the old Abbey estates for the new Chapter. He could not save the Abbot's house, however, which was granted, on Thirlby's translation and the abolition of the bishopric, to Lord Wentworth, who died almost immediately afterwards and was appropriately buried among the

Abbots. Benson survived till 1549, when, worn out with these anxieties, he died and was buried near the entrance to the vestry. A second Dean, the reformer Cox, succeeded and reigned in the Dean's house, and on his flight a third, Weston, who eventually made way for Queen Mary's restored Abbot. Feckenham, whose family name of Howman was, in accordance with the ancient usage, discarded for that of his birthplace, got back the Abbot's house from Lord Wentworth's son and successor, by an exchange for the manor of Canonbury. This second Lord Wentworth it was whose loss of Calais was so much mourned by the dying Queen, and with Mary's life practically ended the reign of the last Abbot. But the house became the Deanery under Elizabeth, and the same Queen founded the institution which now makes a claim to the possession of the older Deanery. At first the School and the Abbey were very closely connected. Dean Goodman was a kind of head-master, and even took boarders into the Deanery; but, to quote again from Dean Stanley, this union "has gradually been disentangled, and at times the interests of the School may have been overshadowed by those of the Chapter." If so, the case before us is an example to the contrary.

It can scarcely, however, even by the most ardent advocates of the proposed cession of Ashburnham House, be looked upon as a gift altogether to the advantage of the School. In a certain sense, it much impoverishes the caputular body, without greatly enriching the educational. The house will be a white elephant in the new hands. To fit its gorgeous chambers for class-rooms, the exquisitely delicate carved work must either be boarded over, or—we shudder to write it—cut away. The fretted plasterwork ceilings will be inaccessible except to pop-guns, but the panelled walls, the pillared alcoves, the dark oak staircase—in fact, all that makes Ashburnham House worth preserving—will be, like dirt, matter in the wrong place. No doubt, the School authorities assert their intention of preserving everything intact; but if they do, it may be retorted, of what use will the house be to them? It is safer in the hands of the Chapter. We cannot conclude that the School authorities will deal more gently with it than they have dealt with the antiquities of their own particular domain. Where, old Westminsters may well ask, is the time-honoured "shell"? Where the open fire-place in the College hall? These are not things removed in the old semi-heathen days before the Gothic revival; but alterations made, as it were, yesterday. If, as some assert, the School is sufficiently well housed already, and wants boarders rather than chambers to put them in, why should Ashburnham House be given up to them to stand empty? The Dean and Chapter can put it to a very good use. The new Canon is homeless, that is, as a canon. Perhaps the new Dean might prefer the spacious chambers and compact plan of the original Deanery to the labyrinthine recesses of the original Abbot's house, with its stairs and passages, its low ceilings, its score and more of half-useless chambers. Ashburnham House would be a model residence for a dean who does not possess the wealth which Dean Stanley lavished so generously. In any case it is an admirable canon's house, and would make a very bad school. The School cannot be honestly said to want another house; while the Canon "in residence" may have to be resident elsewhere. We hear much of proposals for monuments to the late lamented Dean; but so far they have been of a singularly inappropriate character. One of them was to carry out a scheme which Stanley, almost more than any other man, disliked—namely, for the removal of the organ-screen. Here, however, is a worthy object of exertion. Let those who are willing to spend money to commemorate a great man spend a little time and trouble instead, in order to fulfil his dying wishes. There can be no kind of doubt that the whole matter may be adjusted on reasonable grounds. The house may be preserved to the Chapter intact, and no very great injury done either to the interests of the School or to any other part of the Abbey buildings. We speak, not so much in the interests of the Chapter—for whom, indeed, it is not possible to feel very sorry, since it is to their carelessness that the clause in the Public Schools Act is to be attributed—as in the interests of art and historical association. We described Ashburnham House in these columns last spring. Though nothing but tradition can be found for attributing it to Inigo Jones, no mind reasonably acquainted with his rare and precious works can doubt the truth of the ascription, so far at least as the most decorative parts of the interior are concerned. The exterior is interesting and beautiful enough, and may well be older than Jones's time. It is not a great or important building; but neither is St. Stephen's, Walbrook. But Ashburnham House, small and insignificant as it is, stands to modern domestic architecture as St. Stephen's stands to ecclesiastical, as showing the power of a master to produce in a moderate space and with ordinary materials an effect perfectly satisfactory, both in its ornamental details and in the almost scientific beauty of its whole design.

#### THE WANDERING JEW.

THERE are some legends so universally spread through the popular folklore of various countries that one naturally looks for their origin in something more than arbitrary invention or local superstition. To this class belongs the legend of the Wandering Jew—that is, of an eyewitness of the Crucifixion of our Lord, condemned, for having insulted the Saviour, to a joyless immor-

talities and a perpetual wandering over the face of the earth. As early as the middle of the thirteenth century the chronicle of Matthew Paris relates a story of an Armenian bishop who visited England in the year 1228, and being "interviewed" by some monastic clerks, gave an sensational and circumstantial answer to the questions put to him as could be desired. He had seen the remains of Noah's Ark preserved upon Mount Ararat, and he had himself dined with the famous Joseph said to have been preserved from the time of the Crucifixion of Christ, as a witness of that event. The story of the wonderful Jew, as related in the genial after-dinner hours when story-tellers are effusive and listeners most credulous, was told by his host as follows. His name was Cartaphilus, and he was Pilate's door-keeper at the time of the trial. As Jesus was being led from the tribunal, the door-keeper struck him a blow upon the neck and said, "Go on faster; why dost thou linger?" Jesus turned and answered, "I go, but thou shalt tarry until I come." Since that hour Cartaphilus has been waiting, and although he long ago acknowledged the error of his ways and was baptized in the name of Joseph by Ananias—an unfortunate coincidence of names, though the personage who baptized St. Paul, and not the historical perverter of the truth, is meant—the curse has never been removed, and the unfortunate man is still upon his travels. He has been repeatedly interviewed since his *dé-d-tête* dinner with the Armenian bishop, though he seems later on to have given a rather different account of himself, asserting that his name was Ahasuerus, and that he was by trade a cobbler; while he suppresses the incident of the blow. When asked about the events of that remote period, he, as is expected of all good centenarians, shows that his memory is unimpaired by giving exact accounts of all that he saw and heard, including a true and detailed account of the Temple at Jerusalem. It is a pity that those who have preserved the records of these interviews were not more precise in taking down his descriptions, as it would have saved much cost in exploration and much heart-burning and antagonism among archaeologists, could the exact position of Herod's Temple be ascertained from the mouth of one who had actually seen it. As it is, the question of the site of the altar of burnt-offerings rivals the large-end and little-end of the egg controversy with which Gulliver has made us familiar, in its power of engendering bitter and rancorous feelings. It is unfortunate that the narrators of these incidents are not altogether above suspicion. The "Turkish Spy" in 1644, for instance, who gives an account of a personal interview with the Wandering Jew, displays a remarkable ignorance of Mohammedan customs and beliefs, while his knowledge of mediæval Christian history and superstitions is equally noteworthy. Still there seems to be little doubt that impostors did from time to time give themselves out to be Ahasuerus, the immortal Wanderer, and they appear to have found it a very paying business, although it could not have been without its risks, as the mediæval populace must have been sorely tempted to put the pretender's immortality to the test. The very fact, too, of the periodical reappearance of *soi-disant* "Wandering Jews" in various parts of Europe, is a proof of the widespread belief in the legend. How this belief arose, and what were the relations between the story of Ahasuerus, or Cartaphilus, and the popular mythology of Europe, have been recently told by Mr. Moncure D. Conway, a writer who has earned for himself the right to speak as an expert on questions of folk-lore and demonology.

The myth appears to belong essentially to a class of great antiquity, which occurs in every part of the world. Early peoples who had not as yet formulated the natural tendency to belief in the immortality of the soul, were unwilling to allow that their national heroes and the mighty chiefs who had led them to glory and prosperity, had gone from them for ever; and, the wish being father to the thought, such personages were supposed to have sought repose in some secluded earthly paradise, from which they should issue in due time to continue their work of conquest, or to revive the fortunes of the race. To this class belong the legends of Odin, King Arthur, Barbarossa, and Charlemagne; as well as such minor sagas as those of Tannhäuser, Thomas of Ercildoune, and even Ilup van Winkle. Side by side with the heroes too holy or too great to die come the stories of those who for their sins were forbidden the repose of the grave. These are the legitimate congeners of the Wandering Jew, and believers in them could appeal to the Bible for instances of both classes of the undying and unresting ones. Cain, the first murderer, is also the first wanderer; Lamech is another sufferer from the same curse, as shown by the ancient lines:—

Adah and Zillah, hear my voice!  
Ye wives of Lamech, hearken to my speech!  
For the man I slew for my own wound,  
The child I struck dead on account of my own hurt!  
Was Cain avenged seven times?  
Lamech will be seventy times seven times!

Enoch, who "walked with God, and was not, for God took him;" Moses, who disappeared somewhere amidst the mountains of Moab and no man knew where his resting-place might be; Elias, who was carried up to heaven in a chariot of fire, and who in later Moslem legend disappeared in his search for the "water of life"—these are all types of one and the same idea. Early Aryan mythology has a similar story of the mysterious disappearance of the Iranian god-king Yima or Jamshēd, who is bidden away in a terrestrial paradise, and hides his time to usher in again the Golden Age; while later Teutonic myths have a more sinister version of the story in the legend of

the Wild Huntsman who follows the chase amid the storms of the Hartz mountains, and in the fantastic story of the Flying Dutchman, who is beating about in a vain attempt to round the Cape, which is to last till Judgment Day. The popular Messianic idea, also—not the Christian promise, but the Jewish and Moslem notion of a temporal King who shall come to life again to restore the supremacy of his people—and the opposing Antichrist or Dajjal, are types of the same primitive conception. Classical mythology, also, furnishes us with apposite illustrations in the stories of Tithonus, Tiresias, and the Glaucus myth. It is curious to note the close approach which Greek mythology occasionally makes to the Semitic; the myth of Perseus and Andromeda being the counterpart of that of Bel and the Dragon, of Seth and Typhon, of Michael and Satan, and of our own St. George and the Dragon. Perseus is, in fact, a mere anagram of the Phœnician Apollo Resef, whose attributes and story are the same as those of the Archangel.

The legend of the Wandering Jew, however, embodies another and more recent idea; it is the expression of that undying popular hatred of the Jewish race which found vent in the terrible persecutions of the middle ages, and which is again showing itself in the *Judenhetze* which disgraces modern Germany. The Christians looked upon the Jews as a race as the chosen of Satan rather than of Jehovah, and regarded them with a deadly and unreasoning hatred, not only because they had been the instruments in the death and sufferings of Our Lord, but because they were a foreign race, and because the natural instinct of an uncultivated Aryan is to "heave half a brick" at the unknown. A well-known story aptly illustrates the common feeling of the uneducated against the Hebrews. A settler from the backwoods of America came into a town, and meeting a member of the chosen race whose lineaments too surely betrayed his origin, proceeded to inflict upon him grievous bodily injury. On being taken before a magistrate and charged with the crime, he pleaded that the prosecutor was a Jew, and therefore, by implication, a murderer of the Saviour, and consequently deserving of punishment. The humane magistrate pointed out that the era of persecution had gone by, and that, however creditable the Christian defendant's zeal might be, the events which had kindled his wrath had taken place some eighteen hundred years ago. "Now, do tell!" said the ingenuous backwoodsman, "and I only heard of it last Tuesday!" The story, which is probably true, is paralleled by that of the old Englishwoman who, having the same events detailed to her by a sympathetic clergyman, for the first time in her life, said it was all very dreadful, but it was a long way off and a long time ago, and she hoped it wasn't true. The Miracle plays had much to do with keeping alive this race-hatred, and the Jew was long considered to be merely a creature to mock at, to torture, and to rob, and any pain or indignity inflicted upon him was thought to be a work of Christian zeal.

The legend of the Wandering Jew has had great attractions for the poets and artists of Europe. In Germany Schubart first conceived the idea of making "this antique cordwainer," as Carlyle says, as it were, "a raft at anchor in the stream of time, from which he would survey the changes and wonders of two thousand years." Goethe also contemplated a poem on the same subject, but was diverted by the more national legend of Faust. Many others have written on the same theme; but Chamisso, in his *New Ahasuerus*, has perhaps clothed the whole myth in the most picturesque dress. In France its chief exponent is Eugène Sue, whose romance of *The Wandering Jew*, published in 1844, has done more than anything else to revive the popular legend of the middle ages in our own day. His hero is, as Mr. Moncure Conway points out, closely allied to the mysterious undying wanderer, El Khidhr, mentioned in the eighteenth chapter of the Koran. Moses, meeting with an ancient man who, he is miraculously informed, is wiser than himself, travels with him, but not until the stranger has exacted a promise from him that he will not ask any questions, whatever he might see. El Khidhr, in the course of their peregrinations, commits various crimes; and Moses, unable to control his indignation, at length asks for an explanation. The old man then reveals to him that the apparent wrongs were really either retributions or blessings in disguise, and, leaving the Hebrew lawgiver, goes on upon his endless journey through the world. Eugène Sue's Wandering Jew at length finds rest, together with Herodias, who had expiated her foul murder of St. John the Baptist by a similar restless doom. Pierre Dupont's poetical version of the romance, and Gustave Doré's imaginative designs which accompany it, will be familiar to most of our readers. The last, especially, are a faithful transcript of the wild and weird conception which, having its origin in the vague yearnings of a primitive people, has survived until the present time in the ghostly figure of the ancient Jew who literally paid with his life for insulting Our Lord. Mr. Moncure Conway deserves our gratitude for having given a graphic and exhaustive account of this ancient and most curious myth.

#### THE "ENTOMBMENT" AT THE NATIONAL GALLERY.

MR. J. O. ROBINSON has earned the gratitude of a weary and exhausted public. In the darkest hours of the dull season he has contrived to raise a lively artistic controversy. He has brought into the field the Director of the National Gallery and the ex-Director of South Kensington, and he has drawn from

the *Times* an editorial utterance on the subject of Italian painting which in its own way must be reckoned a literary gem. That Mr. Robinson should have come forward to set the world right upon a question of taste is not in itself surprising. He is wont from time to time to take the national collections under his care. He loves in his leisure to re-arrange the images in the Temple of Fame and to correct the blunders of official catalogues. What to other men might seem an irksome and arduous task is to him a pleasant duty. He is not afraid of agitating the nerves of the British taxpayer. A few years ago he pointed out with unflinching courage that one of the most esteemed pictures purchased for the nation at the Barker sale was in reality a worthless wreck. He now hursts upon the world with a revelation that is even more startling and deplorable. But yesterday it was still possible to indulge the pleasant fancy that we possessed in the National Gallery two examples of the art of Michael Angelo; to-day we awake to find that half of our inheritance is gone. Gently, but firmly, Mr. Robinson has removed the tablet from the frame, and there is nothing for it but to pay to our lost illusion the poor tribute of a passing sigh, and to correct the entry in our catalogues. For in Mr. Robinson's mode of adjusting these vexed questions of art there is a finality of judgment that almost precludes discussion. Mr. Burton has, indeed, mildly protested, but, with more of sorrow than of anger, his touching appeal has been promptly dismissed; while Mr. Poynter, who chose to assume a more vigorous attitude of resistance, has been summarily condemned and removed struggling from the court. We doubt not that both these gentlemen now heartily regret their imprudence, and it is perhaps allowable to hazard the conjecture that neither of them would have had the temerity to question Mr. Robinson's authority if the discovery that he has made were not on the first blush so extremely improbable and surprising. This will be the better understood when we add that it even had the effect of surprising Mr. Robinson himself. For some time, indeed, he has been under the impression that the picture of the "Entombment," now ascribed to Michael Angelo, was the work of his rival, Baccio Bandinelli. Mr. Robinson's "intimate acquaintance with the drawings of the master was the principal cause of this conviction"; but, though thus convinced in his own mind, he refrained from giving public expression to his opinion, from the feeling that he had "absolutely no tangible evidence to offer in support of it." What was so long wanting to set the seal of absolute certainty to his judgment has at last appeared in the shape of a passage from Vasari. It is therein recorded that about the year 1526 Bandinelli undertook to paint a picture for the church of Costello, and he went so far as to execute a preparatory cartoon, choosing for the subject of his design the Dead Christ, with the Marys, and Nicodemus, and other figures. But, having found reason at this time to distrust his own skill in the use of the brush, he determined to call in the assistance of a young painter named Agnolo Bigio, to whom he assigned the task of executing the work in colour. Vasari adds, however, that the picture was left uncompleted, owing to the disturbed state of Florence which followed the sack of Rome in the year 1527. This, in brief, is the substance of the story, as set forth in the biography of Bandinelli; and it is this piece of evidence which leaves upon Mr. Robinson's mind "not a shadow of a doubt" that the picture in the National Gallery hitherto associated with the name of Michael Angelo must henceforth be reckoned as "an historical masterpiece of Baccio Bandinelli."

That Mr. Robinson should believe he has proved his case is of course natural enough; but that he should expect other people to accept his conclusions merely upon the evidence he now offers is truly astounding. It will be seen that we are not here concerned with his own personal conviction based upon a critical study of Bandinelli's drawings. Few men have a wider acquaintance with the designs of the Old Masters; and, if he has satisfied himself that he recognizes in the "Entombment" the characteristic qualities of Bandinelli's art, it is improbable that any amount of discussion would avail to change his opinion. At the same time, it would be extremely interesting to know where the drawings are to be found upon which this singular judgment has been formed. All students of Italian art are familiar with Bandinelli's studies, for they are, as Mr. Poynter has truly said, "as the sands of the sea in number"; but although they are of varying degrees of merit, and exhibit a certain diversity of manner such as might be expected from an artist of imitative rather than original faculty, yet we know of no single specimen of his work which accords in essential qualities of style with the design of the "Entombment." This particular aspect of the discussion only goes to prove how great would be the advantage, both to students and to the public, if the drawings of the Old Masters of which we possess so rich a store in the British Museum could be transferred to Trafalgar Square and exhibited side by side with the finished works in colour. The visitor who could turn from the "Entombment" to study the designs of Michael Angelo and Bandinelli would be at once in a position to appreciate the arguments of those who have taken part in the discussion; and we cannot but think that Mr. Robinson's confident assertions would lose much of their force if the evidence to which he appeals were more readily accessible. But this exaggerated estimate of Bandinelli's place in art is, as we have already said, a thing separable from the main point under discussion. Mr. Robinson is doubtless perfectly sincere when he couples the author of the David and the sculptor of the Hercules as "giants in art who in the flesh were rivals"; but, to the majority of those whom he seeks to convince,

the notion of Bandinelli being a "giant" whose name is worthy to be associated with that of Michael Angelo will seem little short of absurd. If, therefore, the evidence now adduced in support of the new attribution is not in itself conclusive, it is but little likely to acquire any added force from Mr. Robinson's personal views as to the characteristic merits of Bandinelli's style. And that the case, as it stands upon the testimony of Vasari, is ludicrously incomplete has, we think, been simply demonstrated by Mr. Poynter. The description given of Bandinelli's unfinished picture might, it is true, be held to apply to the subject of the "Entombment" in the National Gallery, but it has certainly no special application which can be said to fix the identity of the two works. The theme was one constantly chosen by the painters and sculptors of the time, and the terms used by Vasari recur in almost exactly the same form in the biographies of other painters, so that we have nothing left in the way of absolute evidence save the fact that Bandinelli's picture was never finished, and that the "Entombment" by Michael Angelo is also in a state of incompleteness. Thus it will be seen that we are forced, by the very nature of the case, to test Mr. Robinson's so-called discovery by the light of its inherent probability. All other points being in his favour, Vasari's description might, no doubt, be held sufficient to serve the purpose. It is too vague and general in its terms to serve for the purposes of identification; but if the picture were on other grounds acceptable as the work of Bandinelli, it might plausibly be cited as additional testimony in favour of the proposed change of title. It remains, then, to consider what intrinsic evidence there may be for assuming that Bandinelli could have executed such a work as the "Entombment."

We do not propose to repeat in detail the case against Mr. Robinson's view, which has been already most ably stated by Mr. Poynter. It is undoubtedly true, as he has shown in his letter to the *Times*, that even Mr. Robinson's own estimate of Bandinelli's talent goes far to disprove his supposed connexion with the picture in our Gallery. That Bandinelli was a persistent imitator of Michael Angelo is admitted on all hands, and we may echo the words of Mr. Robinson, who justly observes that "if Michael Angelo had never existed, there would have been little heard of Baccio Bandinelli." Is it, then, to be supposed, as Mr. Poynter pertinently inquires, that at a time when the style of the master had reached fulness and maturity, and when the great work upon the ceiling of the Sistine Chapel had long been finished, the foremost plagiarist of his art should have chosen to appropriate Michael Angelo's earlier and more tentative manner? Imitation, as is well known, never errs upon the side of modesty. An artist of Bandinelli's rhetorical manner would certainly not have kept in restraint the characteristic qualities of the style he had chosen to copy; and yet, if the picture in dispute is to be accepted as the work of his hand, we must perforce assume that he could at will cast aside all the characteristic vices of his design, and revert to the reserved and almost timid execution of Michael Angelo in his youth. But if it is manifestly improbable that Bandinelli, the imitator of Michael Angelo, should in the year 1526 have produced such a picture as the "Entombment," the assertion that in this admirable work we are to recognize "the style of design and personal peculiarities of Bandinelli" himself is even more surprising and incredible. If we wish to know what are the "personal peculiarities" of Bandinelli's style, we must seek for them in his acknowledged and authentic works. The quality of design is an essential and unchanging element in artistic production which is readily identified, whatever may be the chosen medium of expression. We find in Michael Angelo's sculpture just those excellences of style in the treatment of the human figure which we should be led to expect from a study of his painting; and we have a corresponding right to expect in Bandinelli's painting the very same defects and mannerisms that belong to his work in marble. How, then, will the "Entombment" compare with the kind of laboured performances upon which the artist was engaged at the time? It must be remembered that Baccio had already conceived and partly executed the colossal group of "Hercules and Cacus." He had completed the large model in clay, and had begun to block out the marble; and yet we are asked to believe that the author of a work of this pretentious and exaggerated character, the public exhibition of which in later years evoked, according to his own confession, "more than a hundred sonnets of the most abusive character," was at the same time engaged upon a design of the chastened and severe style that marks the "Entombment" in the National Gallery.

But there is another point concerning the execution of the "Entombment" picture which would seem to tell with equal force against Mr. Robinson's theory. We are told that we have here a work that "reminds one of painted sculpture, seeming to indicate that its author was more familiar with the chisel and the modelling tool than with the brush." This in itself is partly true, but it is a truth that cuts both ways. If, as Mr. Robinson contends, the picture was only designed by Bandinelli and painted by Bigio, why should the painting be lacking in the technical characteristics of a practised executant? Bigio was a pupil in the school of Andrea del Sarto, and he would naturally bring to his task the fruits of his own study. He would of course accept the design entrusted to him, but he would use his brush and lay on his colour according to the system in which he had been trained; and yet, if we examine the panel in Trafalgar Square, we find that it is in the actual handling of the material that there is evidence of a manner

of working inconsistent with the traditions under which Bigio might be supposed to have grown up. It is in the avoidance of those qualities of colour and tone which belong exclusively to the art of the painter, in the absence of those graces of enrichment in detail which a painter of easel pictures would be especially disposed to bestow, that is to be found the strongest evidence in support of the theory that we have here the work of a painter who was also a sculptor, and of a painter whose style was based upon the study and practice of fresco. But, says Mr. Robinson, the picture is in oil, not in tempera, and no certain work by Michael Angelo exists in oil colour. Mr. Robinson here speaks with absolute assurance in a matter upon which practical artists like Mr. Burton and Mr. Poynter show greater caution. It is obviously not quite clear that the picture is in oil colour, nor is the statement that Michael Angelo was never known to have painted in oil quite so certainly true as Mr. Robinson appears to think. The latest biographer of Michael Angelo, who, in company with the Keeper of the Gallery, made a careful examination of the authentic picture in Florence, emphatically declares that it is executed in oil. Nor is Mr. Robinson on safer ground when he insists that the painters of the time never mixed tempera and oil. This, he declares, should be patent to every practical artist; but Mr. Robinson, we can only assume, is not exhaustively acquainted with the methods of practical artists. It is certain that in the present day the mixture of tempera and oil is by no means uncommon, and it is the opinion of one of the highest authorities among living painters that the practice was largely followed even in the time of Titian. In the treatise of Cennini—a work with which Mr. Robinson is doubtless familiar—the author in one place explicitly recommends the use of oil colour to heighten the effect of tempera in the imitation of textures. These facts have, of course, no especial reference to the picture in dispute, but they serve to show that Mr. Robinson is apt to give an air of certainty to very disputable propositions, and that the confidence with which he announces conclusions in these matters must not be taken as the measure of their accuracy.

It will be seen that our remarks on this lively controversy have been limited to a single aspect of the question under dispute. It has been enough for our purpose to set forth the very strong reasons that exist for rejecting Mr. Robinson's authoritative announcement. His so-called "discovery" is, to our thinking, no discovery at all; and, so far from the attribution to Bandinelli having been proved, the issue of the discussion would rather tend to show that, of all the contemporaries of Michael Angelo, he was the least likely to have executed a picture of this character. That it is, in fact, the work of Michael Angelo is a proposition more difficult to establish, and in the absence of positive testimony as to its authorship there is of course ample room for difference of opinion. The reasons in favour of the present attribution have been urged with force by Mr. Burton and Mr. Poynter, and they seem to us to be amply warranted by the inherent beauty of the picture itself. In connexion with this part of the subject, it may be worth while to draw attention to the somewhat remarkable views which have found expression in the *Times*. The great journal is of course not disturbed by the controversy. It smiles benignly on the combatants with the serene tranquillity of the man of business who knows that the issue will in no way affect the price of Consols. But it offers a solution of its own, which it trusts will be acceptable to all parties. The *Times* is not fond of the picture, but the *Times* admires Michael Angelo and admires Bandinelli; and so, as a way out of the difficulty, the *Times*, in its benevolence, tries to comfort Mr. Robinson by telling him that Bandinelli would have been the first to repudiate the equivocal honour which it is now sought to pay to his memory. This is delicious!

#### THE HISTORY OF A WATERING-PLACE.

THE losses of agriculturists and the languor of trade have fallen heavily on important classes of the community, and many people must have been prudently retrenching in conformity with straitened circumstances. Nevertheless we doubt whether a foreigner visiting our country would remark conspicuous signs of distress. Our docks and wharves are as crowded with shipping as ever; making due allowance for the dulness of the holiday season, the business quarters of London are as bustling as before; and factory and foundry chimneys are everywhere smoking, though shorter work is being done than during the leaps and bounds of our prosperity. Farms have been turned into grazing land or have fallen off in point of cultivation; yet even that would only be apparent to the eye of a practical farmer. And still less would our foreign friend be likely to believe in hard times were we to take him on a yachting cruise around our coasts. We should give him a panoramic sea-view of our innumerable watering-places, and leave their imposing sea-fronts to speak for themselves. Those lungs of the great industrial and commercial centres are the sheer product of ease and luxury. They mean a steadily increasing expenditure of money, not unfrequently lavished in fantastic caprices, mainly by hard-working men who get but few holidays. The society is swelled besides by permanent residents who have realised handsome competencies in the colonies and elsewhere. There are many elderly ladies and widows in the enjoyment of such ample settlements and jointures as are only to be met with in a prosperous old country. Poverty there may

be, but it is kept in the background, and there is little or no actual distress. To do us bare justice, it must be said that charity is a British virtue; the hearts of affluent holiday-makers are naturally disposed to liberality; and where the rich and idle are gathered together, there will be ample occupation for the industrious poor. So the English watering-places, unlike some of their rivals on the Continent, are never left quite desolate and indigent out of the season. We do not say they are actual earthly paradises; and we know that even in the height of their merrymaking they may be haunted by the demon of dulness. But assuredly, when seen from the water on a bright autumn day, they are as gay-looking spots as any on the earth. There are the interminable lines of stuccoed crescents and terraces, either skirting sands that are covered with bathing-machines, or built along the crests of breezy cliffs. There is the lively length of the broad esplanade in the foreground, noisy with children, thronged with loungers, resounding with music, and besprinkled with Bath chairs. There may be the harbour sheltering pleasure and fishing-boats, or vessels of a larger tonnage, which was the original cause of existence of the place; and above all, there are the fresh breezes laden with ozone and invigorating scents of brine and seaweed. Preferences, of course, must be matters of individual taste, but all these places must more or less have attractions, even for the fastidious.

An article on Eastbourne which appeared in the *Times* the other day gives a good general idea of the rise of one of these popular watering-places under favourable circumstances. Only thirty years ago the place consisted of but three small groups of straggling houses. Now these isolated villages are being swallowed up out of sight in the ever-increasing growth of brick and mortar. Terrace has been added to terrace, and street to street; open spaces have been preserved, by laying out public and semi-public pleasure-grounds; while many detached private residences, standing in their gardens, seem to carry the freshness and foliage of the country into the very heart of the town. Shops, of course, have been provided in abundance to supply the wants of so many affluent customers; while here and there a many-storied building or an imposing spire, soaring above the roofs and the lines of the chimney-pots, shows that neither church nor hotel accommodation has been neglected. But the progress of Eastbourne has been methodical and extraordinarily rapid, because many circumstances chance to have conspired in its favour. It has great advantages of air and situation, notwithstanding the neighbourhood of the Pevensey flats to the eastward; and it is within easy reach of London. But, above all, it found what we consider to be essentials to the rise of a thriving watering-place, in an attractive nucleus to start from and an enterprising and wealthy promoter, with authority practically unlimited. As for the former point, experience shows that nothing is more difficult than to create a pleasure-seeking community out of nothing, in an old country like our own. The hotel built in a healthy and picturesque solitude by some energetic speculator may leave little to desire as to its views and its internal arrangements; but our English holiday-makers, as a rule, are sociable folk, and even the self-deluding misanthropes who think they have had more than enough of the world seldom care to lead the lives of hermit-crabs on the shores of a melancholy ocean. And the inhabitants of the brand-new crescent that has risen in its loneliness by the side of the gaunt hotel are thrown still more entirely on their own resources. The spot gets an evil name from those who have suffered all the torments of ennui there; gradually it comes to be shunned as plague-stricken, and the butcher and grocer, those enterprising pioneers of commerce, reluctantly put up their shutters. But the Duke of Devonshire, who has been the good genius, the tutelary deity of Eastbourne, had the luck to find a charming little village-town as the nucleus of a tolerably safe venture, almost under the shadow of one of his numerous country seats. Old Eastbourne, as it is called, with its old-fashioned houses, interspersed with quaint granges and farmsteadings and ivy-covered barns built of flints, all grouped around a picturesque old church, was a peaceful and inviting sojourn for a village-gentleman. Invalids could take their walks abroad on gravel roads and broad field paths, which were merely washed instead of being saturated by the heaviest rain, and which were sheltered by park walls and plantations, backed up by the crests of the encircling downs; and modern Eastbourne, by the way, has copied the idea in the shady alleys that are planted along the principal streets. For those who would rather be actually on the margin of the beach, the Sea Houses offered, perhaps, superior attractions. Many visitors even now prefer to be housed in the old Marine Parade, where the waves after a storm almost wash into the basements, and which commands splendid views eastwards and towards Hastings. The retirement endeared itself to faithful admirers, who came back in successive seasons to find the little lodgings overcrowded. Then a Grand Parade, with its hotel in the centre, became not an inviting building speculation but a positive necessity. A pier followed in due course, partly paying expenses even then by the trifling charge for admission, and counting hopefully on handsome profits in the future. Before the Grand Parade was the strip of promenade, built on a scale expressive of the sanguine expectations that tend inevitably to fulfil themselves, and constructed of solid masonry to resist the violence of the surf. The impulse that had been given gathered strength year by year, because it was due to permanent causes—namely, salubrity and scenery. We are told that the annual death-rate even now is only 19 in the 1,000, which is perhaps as near an

approach to immortality as English folks can reasonably hope for. Eastbourne, lying upon the chalk, is thoroughly ventilated from the ocean. But in its sanitary as well as its architectural arrangements, it owes almost everything to the lord of the soil. A dominating will and a deep purse carried out exceptional schemes for sewerage and water supply. The drainage is deposited by a system of converging sewers, with an outfall four miles away from the habitations; and practically unlimited water is stored in reservoirs after filtering through the purifying strata of the chalk hills. We do not imagine that the Duke of Devonshire was actuated by pure philanthropy, and we are happy to think that his beneficent speculation must have proved amply remunerative. But it is certain that had the works been undertaken piecemeal by small local proprietors and speculators with conflicting interests, there would have been a decided increase in the death-rate, even with less overcrowding in the season. And now, a respectable municipality having been set upon its legs, and fairly started with a rising income, we hear of the construction of additional sea-walls, parades, and public gardens, at an estimated cost of no less than 34,000*l*.

We have spoken of the scenery, as well as the salubrity, of the place. In its scenery Eastbourne is singularly favoured. Old Eastbourne lies among the spurs of the chalk hills, and actually upon the lower slopes of the Downs. Closing the vista beyond the parades in front of the fashionable marine quarter, is the swelling mass of the grand headland of Beachy; while behind Beachy Head, and the long rolling ridge of the green sheep-pastures that dip among chalky hollows and walnut groves near the railway junction at Polegate, stretches for miles and miles the breadth of the Downs, only broken by the Ouse valley between Newhaven and Lewes. Nowhere in Southern England is the down-scenery more characteristic. Looking along it, from Beachy Head, we see range upon range and table-land extending beyond table-land, with a windmill here and there as a landmark. For the most part it is dotted over by flocks of sheep; but here and there it has been reclaimed, and bears crops of roots or corn. The stranger would hardly suspect that, sheltered deep out of sight, are some of the most picturesque villages and manor-houses in the country, with venerable churches and ancient hostleries. To say nothing of the magnificent prospects over the Channel, there is really infinite variety in what seems at first a monotonous landscape; endless innocent excitements await the explorer; and what is simple love on a first acquaintance is likely to grow into an abiding passion. Yet, strange to say—and it is very little to the national credit—those Downs and their villages are almost as much left to the natives as in the days when the rare visitors to Old Eastbourne came as harbingers of the great annual immigration. The ascent of Beachy Head is recognized as a duty; but all behind is left very much a *terra incognita*. Such inexcusable indolence we believe to be the common vice of the ordinary run of holiday-makers. They take their holidays dully, though sometimes boisterously; they seek refreshment from their toils in new forms of excitement or in something like bodily and mental stagnation; and they neglect the opportunities of awakening the instincts and sensibilities which lie dormant in the routine of their industrious lives. No doubt it is generally and practically recognized that our picturesque watering-places play an important and beneficent part in the great plan of our national economy. But we fear that many of their visitors are perversely neglectful of the most health-giving of the enjoyments that are brought within their reach.

#### TRADE PROSPECTS.

**S**PECIAL speculative interest attaches just now to the condition and prospects of trade. That a great impetus would have been given to trade had the harvest this year been good, very few doubted. A single good harvest, of course, would not have recouped the farmers for their losses in so many successive years; but it would have stopped those losses and would have made good a part of them. It would also have given them courage, infused into them the belief that the long series of bad seasons had come to an end, and that an equally long series of good ones was beginning. It would likewise have restored their credit. Bankers and others would have been willing to advance them the means of putting their farms again in good condition, and of taking advantage of the turn in their favour when it came. Further, it would have increased employment in the rural districts. And lastly, it would have saved much money to the country. Every bushel of wheat which will have to be bought this year because of the rains of the last six weeks, is so much money taken out of the country and spent abroad. Had it been paid to our own farmers it would have been expended here at home, and would have gone to employ British labour and British capital. As it is, it will go to enrich Americans, Russians, and other foreigners. At the same time, it is not to be forgotten that in compensation the rains of August have done some good. The long, dry, cold spring and the intense heat of July had parched the pastures, stunted the hay crop, and almost burnt up the root crops. The damp, warm August vastly improved the green crops of every kind, and though it did not make up for the failure of the hay crop, it yet improved the grass immensely, and therefore provided autumn feeding for sheep and cattle. It is to be borne in mind, also, that the great heat of July hastened the ripening of the harvest in many quarters,

and that not a few skilful and prompt farmers were able to get in their crops before the wet came. It is likewise to be recollected that the harvest is not yet ripe in the North of England, in Scotland, and in Ireland, and that, if good weather should now continue, much of the corn crops in these districts may turn out excellent. But, when all is said, there can be no doubt that the rains of August did great and irreparable damage to the English harvest, and threw the farmer into a state of discouragement and discredit from which he will not easily escape. The question now is whether, in the face of an agricultural distress which has continued for six or seven years without a break, trade can go on improving, or whether the revival that set in two years ago is about to come to an end.

That revival had two distinct causes. First and chief, no doubt, was the reaction from the excessive discredit that followed the Glasgow Bank failure. The discredit which that failure caused in commercial classes was so great, and paralysed trade to so large an extent, that stocks were allowed to run down below the point at which they are usually kept, and it was inevitable that a reaction must come. The moment at which it did come was determined by the purchases of iron on American account. Three successive good harvests had restored prosperity to the United States, and, as usual in all periods of returning prosperity, the Americans took up again the plans of railway construction and extension which they had been obliged to suspend after the panic of 1873. The long and severe depression through which they had passed had put out of working order a large number of their iron and coal properties; and, when the work of railway extension was resumed, they found themselves without sufficient stocks of iron to go on. They had therefore to come to this country and to Europe generally to supply themselves. The large purchases, and the rise of prices which they led to, excited hopes that we were about to witness an immense development of trade between this country and the United States; that these American purchases would not be confined to iron alone, but would extend to almost all British manufactures; and the result was great speculative activity. The hope inspired in this way gave general courage to business men to re-supply themselves with stock, and thus in a moment the discredit that had followed the Glasgow Bank failure passed away. The influence of the American purchases was greatly aided by the large demand that had then sprung up for cotton piece goods in the far East, and more particularly in India. During the famines in India the import of cotton goods had greatly fallen off, people being too poor to re-stock their wardrobes; but on the return of better harvests they began again to purchase largely, and thus it happened that the two greatest industries in England—the cotton and the iron—were simultaneously benefited by large foreign purchases. It is a matter of common experience that when one or two great trades like these suddenly become prosperous their prosperity is transmitted through the various other trades of the country, and, as we have just been observing, had we been favoured with good agricultural seasons, we should now, no doubt, be enjoying a large measure of national prosperity. But just as the harvests have been disappointing, the purchases of iron on American account have fallen off, and there are symptoms that the purchases of cotton goods in India also are decreasing. The American purchases of iron fell off because the great rise of price stimulated production at home, and the American iron works are now able to supply all the native demand. There are appearances, indeed, that stocks are running low in the United States, and we should not be at all surprised if before long the American imports were to increase very largely. They are already increasing sensibly, but for the present the increase is small, while the falling-off, as compared with the purchases in the autumn of 1879 and the spring of 1880, is very great. The cause of the decrease in the Indian imports of cotton goods is different, and we hope will be much more temporary. It is due to the factitious dearth of cotton caused by the great "corner" in Liverpool of which we have all heard so much. In a very short time fully a penny per pound has been added to the price of the raw material in Lancashire, and consequently Manchester merchants are obliged either to produce less or to ask higher prices for their goods. But higher prices very soon begin to tell upon the exports to India. As soon, however, as the "corner" comes to an end, the price of cotton no doubt will again decline to a point which will admit of a large addition to the exports to India. Meanwhile, however, as we have said, both cotton and iron are less prosperous than they were at the end of 1879.

Under these circumstances, it is especially interesting to examine the Board of Trade Returns for August in order to see how the trade of the country is advancing. They certainly give no grounds for the impression that there is any decrease. On the contrary, there is evidence of decided increase. For the month alone the increase in the value of the exports is a little over two millions, or about 10½ per cent., while for the eight months ended with August the increase is somewhat over 2½ per cent. It will be observed that the increase for the month is very much greater than for the eight months. This in itself is a most encouraging sign. It shows that the diminution in trade, caused by the severity of the winter, is passing away, and that the improvement is receiving momentum as the year advances. August, in other words, has seen a larger increase in the exports than any previous month in the current year, and it is a fair inference that the improvement will not suddenly begin to slacken.

Another favourable sign is that the increase is very general. It is not, as was the case two years ago, confined to one or two great industries, but extends to almost every important article of export except cotton manufactures, the reason for the falling-off in which we have just stated. Yet another very satisfactory point is that the exports of iron and steel of all kinds show a very large increase—20 per cent. over those of August of last year—and a considerable proportion of the increase is due to American purchases, suggesting, as we have already observed, that the home supply is beginning to fall short, and that the Americans are again augmenting their purchases from us. The imports for the month show an increase of nearly 5½ per cent., but for the eight months ending with August they show a decrease of a little over 4½ per cent. The imports had shown so considerable a falling-off in the previous part of the year that the increase during August was not sufficient to make up the deficiency. In part the decrease is due to a diminished import of wheat and wheat flour. In raw materials the increase during August is general, except in the case of timber. The rise in the price of cotton attracted large imports of the raw material from India, and to a less extent also from America, Egypt, and Brazil; but, speaking generally, the imports of the raw materials of manufacture show a very marked and very satisfactory increase. Thus, the total increase for the month in the value of the imports is 1,672,000*l.*, and of this 1,510,000*l.* is due to raw materials; while in the food products, properly so called, there is a decrease of 1,336,000*l.*, and in what we may call luxuries an increase of 283,000*l.*; in other specified articles an increase of 665,000*l.*, and in unenumerated articles an increase of 550,000*l.* Thus, the increase in the imports of the raw materials of manufacture is greater than in all other articles put together. All this is a most favourable sign. If trade were not improving, it is not to be supposed that traders would continue to import larger quantities of raw material. And the fact that those imports are increasing is evidence not only of improvement in trade, it also testifies to a more hopeful spirit on the part of those engaged in trade, who clearly must believe that the improvement will continue.

The evidence afforded by the Board of Trade returns is confirmed by the Railway Traffic returns. Thus, for the ten weeks ended September 3, on seventeen selected British and Irish railways we find an increase in the receipts of 371,000*l.*, of which as much as 274,000*l.* is in the receipts from goods, and 97,000*l.* in those from passengers. The increase would be still larger if we were to confine our list to purely British lines, as upon the Irish lines there was a falling-off throughout the whole period. Still the figures are sufficient to show that the movement of goods is much larger than in the corresponding period of last year; in other words, that a larger volume of business is being done. Again, the Bankers' Clearing House returns for June, July, and August show on the 4ths of the month increases throughout, amounting to over 2 millions in June, to over 4½ millions in July, and to again over 2 millions in August. Very little of this increase is to be attributed to speculation, for the settlements on the 4ths of the month are settlements in trade proper. We have purposely avoided reference to the Stock Exchange settlements in these months, which show still larger increases, although the fact that speculation is rife is itself evidence, so far as it goes, of a more hopeful spirit in trade. Unless credit was good, and the business public expected better times, speculation could hardly prosper. The Revenue returns, like those of railway traffic and of the Bankers' Clearing-house, likewise afford evidence of improvement; but as yet it must be admitted that the improvement in this respect is not very distinct, though, so far as it goes, it is encouraging. Altogether, then, so far as statistics go, the condition of trade is healthy and its prospects are encouraging. The unfavourable features are the injury done to the harvest by the late rains, and the danger of dear money should the drain of gold to New York be resumed. For reasons which we have often stated in these columns, we do not think, however, that the drain of gold is likely to assume such proportions as to make money really dear—that is, so dear as to tell injuriously upon the course of trade.

#### THE THEATRES.

A FRENCH writer who recently attempted to make his readers understand what is meant by the "adaptation" of their countrymen's plays to the English stage, gave "arrangé, dérangé, bouleversé, défiguré," as the proper equivalents. These words very accurately describe the process by which Mr. Mortimer has contrived to make *Reclaimed* out of *Les Vieux Garçons*. M. Sardou's comedy is, doubtless, not the kind of piece which it is desirable to see on our stage. Although an English audience recently showed more than toleration for a play in every respect worse, we may hope that the example will not be followed. The success of *Heartsease* should be no precedent for familiarising the English playgoer with plays such as *Les Vieux Garçons*. We have no desire to see either the lively vice which supplies their dramatic motive or the somewhat mawkish sentiment which pleases French audiences established on our boards. Nor do we suppose there are two opinions on the subject. This view of what is fitted for dramatic representation would justify a refusal to produce *Les Vieux Garçons* in any shape whatever; but it does not excuse Mr. Mortimer for adapting it so as to ruin it completely as a play. Even if all that is offensive in his original had been removed, we

should still think the adaptation a mistake. It is surely as easy to write an original bad play as to laboriously "adapt" a French one into absurdity. But, as a matter of fact, what is, or at least is supposed to be, offensive to English audiences in M. Sardou's play has not been rejected in *Reclaimed*. It has only been covered by a thin veil of decent language which, if it is taken seriously, deprives Mr. Mortimer's play of all dramatic life. Those of the Haymarket audience who were not acquainted with *Les Vieux Garçons* must have found it very difficult to understand what *Reclaimed* meant, and the English piece can only be explained by constant references to the French original. The central personage of M. Sardou's comedy is a veteran *roué* who is at last reformed by the purity of a young girl whom he has tried to seduce, and by the discovery that a rival with whom he is on the point of fighting a duel is his own son—of course, the child of a married woman who had been his mistress. The conversion of Mortimer by the innocence of the *ingénue* and the discovery of his relationship to M. de Nantya, the lover, makes one of those sentimental *coupes de théâtre* which the most cynical French audience loves. It is led up to with all M. Sardou's skill in construction, and the details are filled in with infinite dexterity. There is wit, and no doubt a certain truth to life, in the picture given of Mortimer, his bachelor friends, the foolish young married women who play at feeling the "storms of life," and the husbands whom *les vieux garçons* propose to make their victims. But, whether or not a true picture of French society, *Les Vieux Garçons* has dramatic life and probability. The characters are carefully defined in the first act, and, the first act being accepted, what follows is natural and logical.

In his adaptation Mr. Mortimer has carefully eliminated from the French piece everything that gives it dramatic probability. At the very threshold he has committed the mistake of laying the scene of his play in England, and so at once trebling the improbability of the comedy. Mr. Delafield's drawing-room and Colonel Abercrombie's chambers and the things done there all belong to some stage fairland. Then M. Sardou's first act, in which Mortimer (the Colonel Abercrombie of *Reclaimed*) explains his theory of life, and without which the rest of the play is unintelligible, has been suppressed. M. de Nantya becomes Captain Llewellyn. His motive for not taking his father's name is not, as in the French play, an honourable scruple as to bearing the name of the man whom his mother had betrayed. He changes it because his mother has been divorced, not by her own, but by her husband's fault, which seems no reason at all. The Mortimer of *Les Vieux Garçons* gives up trying to dishonour his friend's wife, only to attempt to seduce Antoinette. In *Reclaimed* we see nothing of the designs on Mrs. Delafield, and the Colonel is only desirous to marry Grace. When Llewellyn is furious at discovering that Grace has been in the Colonel's room, and insults him, Abercrombie has a perfectly easy and satisfactory answer. That Mortimer should be unable to find out who De Nantya was is perfectly natural, but it is improbable that Colonel Abercrombie should be unable to discover the origin of his brother officer. But the crowning absurdity of all is Abercrombie's behaviour when he discovers that the man with whom he is about to fight a duel is his son. Mortimer has good reason to be silent, but his English representative has none whatever for not telling the truth. In making the two men brother officers, Mr. Mortimer has gone out of his way to add improbability to improbability. It naturally follows that half the dialogue of *Reclaimed* is utterly without point. The cynical rascality of Mortimer, who believes in no woman's virtue, has neither rhyme nor reason as uttered by Colonel Abercrombie. It is almost superfluous to add that the bright crisp French of M. Sardou is utterly lost in the translation. Attempts at seduction are not things we desire to see familiarized on our stage; but it is impossible to avoid recognizing the absurdity of keeping the machinery of a French play founded on them, and changing the motive. Either most of the characters of *Reclaimed*—and there are many we have not mentioned—are doing nothing at all, in which case the piece has no dramatic life, or they are trying to do something immoral, and in that case we do not see what Mr. Mortimer has gained by all his trouble.

That the part of Colonel Abercrombie was taken by Mr. Hermann Vezin, and was consequently excellently played, is the only feature of the acting which calls for much notice. He acted with grace and finish, and, when his part (we mean the part of Mortimer) called for it, with power. The tedious rôle of Sir John Maudsley was intelligently played by Mr. Alfred Bishop; and Mr. George Weathersby as Mr. Redfern was at least not offensive in his accent or his gestures. The other members of the company, except Miss Cowell, who is colourless, were so in either one or the other, and some of them contrived to be so in both.

Any one who is frightened by the verbose nonsense written about the realism, moral teaching, and so on, of Mr. Sims's *Lights o' London*, may be recommended to go and see the piece, with the certainty of being agreeably disappointed. His moral teaching is good stage sentiment, and his realism is confined to a few scenes from the life of the poor in London, carefully selected, and, so to speak, well washed. The *Lights o' London* is a domestic melodrama, and a fairly good piece of its kind. The characters are all old friends. We have the virtuous hero, who possesses all the qualities that appeal to the gallery, who is at once a gentleman defrauded of his rights and a poor man struggling with malignant persecutors—a claimant, in short, whom the people love as one of themselves because he is not one of themselves. Then

there is his "true wife," daughter of the lodge-keeper to the home of his ancestors. The keeper is a worthy man, who, with a truth to life rare in such cases, resigns himself with much philosophy to thinking that his daughter is the young master's mistress. The hero has a stern father and a wily enemy, his cousin. The cousin, again, has a subordinate villain at his beck and call. This minor scoundrel has a beautiful daughter, altogether worthy of him, who pairs off with the wicked cousin, and all three combine for the ruin of the virtuous hero, with triumphant results up to the end of the fourth act, and well-deserved punishment in the fifth. What the plot of the *Lights of London* is, we shall not attempt to explain. Indeed we doubt whether it can strictly be said to have a plot; but it undoubtedly has, what is of far greater importance in such pieces, an exciting story, plenty of incident, and a soul-stirring crash at the end of each act. There are arrests, robbery, escapes, attempts at murder, and an effectual killing, a rescue from drowning, and a general free fight. The play has the too common fault of dragging somewhat in the dialogue, particularly in the first and third acts, but that might easily be remedied by confining the actors to saying their say only once in these scenes, instead of two or three times over as they do at present. Mr. Sims would also do well to alter the words of his hero's part in one passage of the first act. This young gentleman returns to his father's house in rage, and breaks down in an attempt to maintain a gay and careless air while pronouncing the words—"dress clothes." This is too suggestive of the hero of *Ten Thousand a Year*, who wept over the good dinners he had eaten and would eat no more. But, in spite of occasional tedium and absurdities of detail, the *Lights of London* is an entertaining piece. Mr. Sims has not shown himself a great moral teacher or a powerful realist. He understands his business much better than his injudicious friends, and has written a fairly good domestic melodrama.

The acting of the play is excellent throughout. Mr. Wilson Barrett played the hero, Harold Armytage, with emphatic virtue. As the smiling villain, Clifford Armytage, Mr. E. S. Willard thoroughly deserved the applauding hisses of the gallery. Miss Eastlake moved the hearts of all the audience as the suffering heroine, Bea, and showed a very real power of expressing emotion, not only of the noisier kind. The way in which she "tured" her husband on to thrash his enemy while he had the chance was beyond praise. The minor parts were well filled, and the crowds could not have been better drilled by the manager of the Saxe Meiningen. No better mounted piece has been put before a London audience for a long time past.

The fact that the Park Theatre was fortunately empty when the fire broke out in it on last Saturday night will probably, as usual, make the public overlook the real lessons of the accident. From the rapidity with which the flames spread, it is only too probable that, had the fire broken out a few hours before, a terrible disaster would have been the consequence. As it is, the alarm and disturbance caused to the neighbourhood afford one more warning, if any is needed, to all who have any control or influence over theatres to insist on the adopting of every possible precaution against fire. This moral is neither new nor striking, but as long as it is neglected—as it has hitherto apparently been—it will need repeating. We hope that the assurances given, that the houses now under repair or in course of construction are being properly fitted, are well founded. That all possible precautions have been taken, should certainly be made an indispensable condition for the granting of every licence.

#### THE ST. LEGER.

**M**OST people who attend both the Derby and the St. Leger must have more agreeable recollections of the latter than of the former. Epsom Summer Meeting takes place at the height of the London season. At that time of year people are labouring to earn either money or popularity. The very Derby day itself is a holiday which can scarcely be snatched from the claims of business or society without inconvenience, and there is an unpleasant atmosphere of fuss and hurry about the whole thing. At Doncaster matters are quite different. Everybody—even to the toiler after pleasure—is taking a holiday at this season of the year. Parliament is no longer sitting; there is but little business going on in the City; barristers are not even nominally occupied; and there are no more drums and dinner parties to bore unhappy idlers. There are no debates to be waded through in the newspapers; even the smart article-writers themselves are taking their holidays; and the papers can be gleaned of everything worth remembering in a few minutes. Such being the condition of affairs, it can hardly be denied that the surroundings of the St. Leger day are happier than those of the Derby.

As Midsummer this year the approaching St. Leger had promised to be unusually interesting. In the Two Thousand Guineas Peregrine had been first and Iroquois second, while in the Derby Iroquois had been first and Peregrine second. It was expected that the rubber would be played out in the St. Leger, and that the respective merits of the rival champions would be finally settled. To the great disappointment of the racing public, Peregrine went wrong and had to be scratched for the race. When it was known that Peregrine had failed, many people at first said that the St. Leger would be a gift for Iroquois, and that the race would be without interest; but as time went on they changed

their minds. It was soon remembered that on his two-year-old running St. Louis would have started first favourite for the Derby. Unfortunately, a slight splint on one of his forelegs had required surgical treatment at a critical period of his training, and consequently he had run for the Derby without anything like a proper preparation. Even in this state he had run very forward in that race for a mile, and then he had stopped from want of condition. Objectors were ready to argue that unless the horse had been considered fit by his trainer, he would not have been ridden so forward during the early part of the race, and that it had yet to be proved that he could stay; but that the general opinion was in his favour was proved by the fact that his price in the betting market kept gradually but steadily shortening. One thing seemed certain—namely, that St. Louis had undergone as thorough a preparation as any horse that was to start for the St. Leger, while the training of Iroquois had been interfered with by a cough. If, therefore, Iroquois and St. Louis were equally good horses, it seemed fair to reason that St. Louis ought to be a few pounds the best of the pair on the day of the St. Leger, as Iroquois had been stopped in his work for a short time, while St. Louis's preparation had been uninterrupted. Another horse, whose training had been interfered with during his preparation for the Derby and the Two Thousand Guineas, was Scobell, who had been laid up for a time with a bruised foot. The day after the Derby he had won the Epsom Grand Prize, in which he had given a stone to Ishmael, a horse that had subsequently won the Great Yorkshire Stakes. Yet at Ascot, Scobell had only run third at even weights to Voluptuary, who had been nowhere to him when receiving 4 lbs. in the Epsom Grand Prize; and in the Grand Prix de Paris Scobell had not even been placed. There appeared to be about two stones between his best and his worst form, and it would have been hard indeed to predict with certainty that any horse of his year would beat him if he were well and in his best humour. Ishmael's performance in the Great Yorkshire Stakes was a good one, but its value was questioned by many critics, on the ground that the course was in a very heavy state. In appearance Ishmael did not look like a St. Leger winner; but nothing that was to start looked like a racehorse of the very best class. Limestone was the best-looking horse in the race; he had not been placed in the Derby, but at Ascot he had run Voluptuary to a head, and had beaten Scobell by a length, and at the same meeting he had won a Triennial Stakes very cleverly. At Goodwood he had given Geologist 3 lbs., and beaten him by a neck, and in the same race Voluptuary was unplaced, although he was receiving 3 lbs. from the winner. Geologist had only won one race in his life, and had been very often beaten, both as a two-year-old and as a three-year-old, but he had always been, and still continued to be, a favourite with many good judges. His backers throughout the season had seemed determined that he should win a great race, even when he had evinced no disposition to do so. Voluptuary had not won many races of importance, but he had made most manful running in the Derby, and he had, in different races, beaten Scobell, Limestone, and Ishmael. Privateer had begun his season by winning a couple of races at Goodwood. The same horse ran him to a head in both races; and, as this animal belonged to the owner of Iroquois, it was naturally believed that, if Iroquois was still boldly supported by his stable, Privateer's chance of winning the St. Leger must be a very remote one. At one time there was a strong disposition to back Lucy Glitters at outside prices, but she subsequently ran so badly that she became practically unnoticed. Before many St. Leger's the chief question asked among racing men has been, "Will the mare win?" This year no mare had any pretensions to favouritism. If Thebais, the winner of the Oaks, had been entered for the St. Leger, she would probably have been the first favourite throughout the summer. Up to the day of the race she had won on every occasion that she had raced this season, and she had run over long courses and short courses, on hard ground and on soft. Last year she had lost her two earliest races, but afterwards she had won ten races in succession before the end of the season.

The interest of the St. Leger was not entirely of a satisfactory character. Instead of consisting in the difficulty of foretelling the best of several horses of surpassing excellence and in perfect condition, it lay rather in the question whether the best horses in the race were not, from one cause or another, somewhat out of form. It may, indeed, with justice be said that, between splints and bruised soles, coughs, influenzas, and roarings, the history of the St. Leger of 1881 is one long story of infirmities and afflictions. If the absence of the name of Thebais from the nominations was to be regretted, there was even greater cause for lamentation in the roaring of Bal Gal, who, on her best form of last year, ought to have had the St. Leger completely at her mercy. It is interesting to remember that she beat Iroquois, St. Louis, Scobell, Thebais, and all the best horses of her own age during her first season, and that in some cases she won in a common canter by several lengths. At one time, shortly before the St. Leger, so many of the favourites lay under suspicion of unsoundness, that some people began to think that Bal Gal, roarer as she was, might still have some chance of winning. For a few days every horse was mistrusted, and Iroquois went up and down in the betting in a manner which was enough to puzzle even the best-informed as to his merits and condition. The first favourite changed almost from hour to hour, and the instalment of any horse at the head of the quotations was almost a certain sign that rumours would shortly be forthcoming to the effect that he was unsound, that he had been beaten in a trial, or

that he had lost his form. As may easily be imagined, there were plenty of people ready to take advantage of such a state of things as this; and, when once a condition of panic had been established in the betting market, constantly varying reports were industriously circulated by persons who availed themselves of every opportunity of profiting by the changing prices of the different candidates in the quotations. Early in the Doncaster week, Iroquois was once more firmly established as first favourite, and he maintained his position until the start; but to the very last there were people who continued to spread evil reports about him. They said that he did very little work on Monday morning, that he was taken home suddenly in a suspicious manner to his stables, and that there was a mysterious something the matter with him which precluded all possibility of his winning. It was said that if President Garfield were to die before the race, Mr. Lorillard would not allow his horse to run; and it was even rumoured at one time that Archer was not well, and would not be able to ride the favourite. It was also reported that there was a flaw in Iroquois's nomination for the St. Leger, which would disqualify him if he were to come in first.

The St. Leger day was fortunately fine, and there was a large attendance to witness the race. Fifteen horses came out for the start, and it was the general opinion that in appearance they were rather below than above the average. Iroquois was at last very firm in the betting at 2 to 1; St. Louis and Ishmael were equal favourites at 5 to 1; and Limestone and Geologist at 11 to 1. Next in estimation came Scobell, then Voluntary, and then Bal Gal, at 20 to 1, a shorter price than any that had been taken about her for some time before the race. When they had got off and fairly settled down to their work, Josyan and Falkirk made the running as far as the Rifle Butts. It may as well be said that this statement is made entirely from hearsay, for the atmosphere was so dull and misty that little could be distinctly seen by those on the stands except the start and the last half mile of the race. It is understood that after getting a good start, Iroquois was pulled back, until he was absolutely last as they went over the brow of the hill. St. Louis, Ishmael, Geologist, Scobell, Limestone, and Lucy Glitters are said to have kept forward during the greater part of the race. At the Red House Josyan and Falkirk gave up the lead, and then Ishmael took up the running for about a quarter of a mile, when he fell back beaten, accompanied by St. Louis. Lucy Glitters then led to the distance, where Iroquois came to the front, followed by Geologist. When once Iroquois had come forward, there was no doubt about the result. He was about a length in advance of Geologist as he passed the winning-post, and Geologist was somewhat less than a length in front of Lucy Glitters. St. Louis was fourth, but a bad fourth. Ishmael, Scobell, Limestone, and Bal Gal had nothing to do with the finish.

As a confirmation of public form, the St. Leger was, upon the whole, a satisfactory race. It is, of course, quite right that the winner of the Derby should win the St. Leger. The relative positions of Limestone and Geologist, when compared with their previous running, were rather unaccountable. It would seem that St. Louis cannot stay, otherwise his two-year-old running with Lucy Glitters and Geologist in the Middle Park Plate would be inconsistent with his position in the St. Leger. Geologist has not hitherto been a lucky horse. His race in the St. Leger was the fourth running in which he had been second. His form with Iroquois in the Prince of Wales's Stakes at Ascot was proved by the St. Leger to have been correct. At Ascot, Iroquois had given him 9 lbs. and had beaten him by half a length. In the St. Leger, at even weights, Iroquois had beaten him very easily by a length, with perhaps a few pounds in hand. There seemed to be some prospect of the relative merits of these two horses being still further analysed, as they were both entered for the Cesarewitch, Iroquois being handicapped to give 12 lbs. to Geologist.

The result of the St. Leger is a well-earned triumph for the Americans. It is only to be regretted that their representative was subjected to so many evil reports by the scum of the English betting ring. The success of Mr. Lorillard was highly popular, and received one of the loudest demonstrations of applause ever given to a St. Leger victory.

## REVIEWS.

### BREWER'S HISTORY OF GERMANY.\*

DR. BREWER opens his preface with the rather startling assertion that "no history can be compared in interest to that of Germany, and none is so suggestive or dramatic." Such extravagant enthusiasm as this inevitably excites a suspicion that the writer has not been very long familiar with his subject; and the suspicion is confirmed by a closer study of the volume. In one passage Dr. Brewer talks of "reading up" the lives of certain sovereigns "from State papers and other original sources"; but we have observed few traces of "original sources" in any part of his narrative. Its general character suggests that he must have contented himself with the study of a few authorities selected at random, and that his study even of these must have been hasty

and superficial. The history of Germany is very imperfectly understood by the majority of Englishmen, and a trustworthy account of it would be a useful addition to our literature. Dr. Brewer, unfortunately, teaches much that would have to be unlearned by readers who derived their first impressions from him; and he omits still more that is necessary to a thorough comprehension of the governing tendencies in the development of the German Constitution.

We naturally expect that an historian of Germany will begin with a full description of the condition of the country in primitive times. The statements and hints of Tacitus have been interpreted by Waitz with so much learning and insight that the task is now comparatively easy; but the only writer of this name of whom Dr. Brewer seems to have heard is Waitz the anthropologist, to whom, by the way, he attributes one of the works of the author of the *Deutsche Verfassungsgeschichte*. Even without reference to Waitz, a fairly conscientious writer might make the *Germania* the basis of a very instructive chapter. Dr. Brewer, however, has only managed to bring together a few meagre notices, some of which have not even the merit of being accurate. He asserts, for instance, that the ancient Germans at one time "believed in a single supreme Deity," and that they afterwards abandoned "this simplicity of religion" in consequence of the influence of "Celtic and Roman superstitions." A writer who could say this could say anything; and it prepares us for Dr. Brewer's statement that "from the time of Tiberius to that of Charlemagne the political history of the Germans is almost a blank," and that "during this period many petty States were formed." The truth, of course, is that from the third century onward there were far fewer "petty States" in Germany than there had been before. The Germans had learned that they could hope to maintain their independence only by union, and the tribes, each of which was a "petty State," gradually merged their separate rights in those of several important confederations. That "the political history of the Germans is almost a blank" from Tiberius to Charlemagne can only be said if we are prepared to leave out of account the history of the Franks; but it is difficult to understand how this can be done, since the Franks were simply a group of German tribes, and the whole of Germany was ultimately a part of the Frankish kingdom. Dr. Brewer, with the courage of his opinions, passes almost at once from "the Goths and Huns" to Charlemagne, merely filling in the intervening period with some dry remarks on the introduction of Christianity into Germany. The result is that no one who obtained his information from Dr. Brewer's narrative would have the faintest idea of the circumstances in which the kingdom of Germany originated. Although he is in so great a hurry to reach the most commanding figure of early mediæval history, he manifests very little knowledge of the true causes of Charlemagne's importance. Dr. Brewer is careful to tell us that Charlemagne "preferred roast meat to boiled," that "at his noonday meal his attendant brought him up his favourite roast on a spit, hot from the fire," and that "after dinner he took a little fruit, and then a nap for about two hours." We do not quarrel with Dr. Brewer for setting down these details, but they can hardly be said to compensate us for the absence of a precise record of the events of Charlemagne's reign. Nothing in the career of Charles is more striking or significant than his prolonged contest with the Saxons. For more than thirty years they troubled him, but he would not rest until they were finally conquered. He must have had some very strong reason for persisting in a struggle that cost him so many sacrifices, and the reason seems to have been that the predominance of the Franks in Germany was necessarily insecure so long as there was a wild, independent people on their north-eastern frontier. Dr. Brewer appears to regard the wars in Saxony as a sort of accident, and the few lines which he devotes to them are tame and cold. In describing the assumption of the Imperial crown by Charlemagne he has nothing to say as to the underlying causes which led to this great event; and he shows no grasp of the principles which marked the administrative system of Charlemagne and his far-reaching ecclesiastical policy.

In the time of the Saxon and Franconian dynasties the power of the sovereign was usually greater in Germany than in any other European country; but it was gradually undermined, until at last it existed only in name. One of the chief problems of German history is to explain this steady decay of the royal authority, and even in England, thanks mainly to Mr. Bryce, the true explanation is now pretty well known. It is to be found in the connexion of the German with the Imperial crown. Had the German Kings confined themselves to their own country, there is no reason to doubt that they would have been able to subdue the great feudal chiefs, and that Germany would have been united several centuries before the real union of France was achieved. Being Emperors as well as Kings, they came into violent collision with the Papacy; they could not avoid a deadly struggle with the Lombard cities; and they were tempted to waste their strength in Southern Italy. Thus the princes and nobles had innumerable opportunities of usurping royal rights, and the time came when it was too late to undo the mischief that had been accomplished. All this is occasionally referred to by Dr. Brewer, but he does not see that it ought to form the principal element in the mediæval history of Germany. When he reaches the thirteenth century, he is obliged to represent the nation as composed of a great many small principalities, virtually independent; but he gives his readers only a dim and confused impression of the process by which this state of things was brought about. He is not

\* *The Political, Social, and Literary History of Germany.* By the Rev. Dr. Colman Brewer. London: De La Rue & Co. 1881.

more successful in his treatment of the immediately succeeding period. He repeats the praises which used to be lavished on Rudolph I. by Austrian historians; but in reality Rudolph did very little for Germany; he discouraged the cities, the natural allies of the Crown, and was chiefly anxious to secure the prosperity of his own family. Dr. Brewer can hardly find epithets strong enough to express his dislike of Albert I., whom he describes as "big-nosed, loose-lipped, blind of one eye, rude in manners, grasping, selfish, and overbearing." Yet Albert was one of the few sovereigns who saw the importance of the cities, and he made sincere attempts to maintain the public peace. The death of Henry VII., we are informed, "was a great loss"; and he is said to have been, not only "brave and powerful," but "sagacious and just." His justice, however, would have been more readily acknowledged by the princes than by the great towns; and we may question his sagacity in endeavouring to revive the glories of the Empire. The reign of Lewis IV. was rendered memorable by the renewal of what Dr. Brewer calls "The old, old quarrel between Pope and Emperor." "The beginning of the end," he says, "had set in, and the thunders of the Vatican were passed by as the idle wind which no man regarded." This is true; but Dr. Brewer should have accounted for the fact that those Papal claims which had found so many supporters in former times were rejected by the entire German people in the fourteenth century.

Dr. Brewer allows himself ample space to say everything that is necessary for his purpose regarding the Reformation; but here also his knowledge is very inadequate. The Reformation was not, as he supposes, due exclusively to the worldliness of the clergy; many causes combined to produce it, such as the influence exerted by the Mystics on tender and sensitive minds, the devotion of the Humanists to classical study, and the rising spirit of nationality which was shared by all classes. Among the immediate effects of the Reformation were several political movements which might easily have resulted in consequences of the highest importance. The barons, who had always resented the tyranny of the princes, fancied that they might achieve independence; and they had scarcely been suppressed when Germany was convulsed by the Peasants' War. These agitations Dr. Brewer does not even mention, although they are in themselves full of interest, and reveal some of the deepest tendencies of the age. He is silent, too, as to the causes which induced Charles V. to side with the Catholic party. No sovereign after Charles V. had so good a chance of establishing a great and enduring empire; but there were elements, both in his personal character and in his official position, which rendered it impossible for him to take advantage of the opportunity; and Dr. Brewer would have been much better employed in indicating these elements than in retailing a quantity of absurd gossip about the Emperor's last days. When the Reformation seemed to have triumphed, the aspect of affairs in Germany, and, indeed, in the whole Western world, was changed by the Catholic reaction of which Ferdinand I. was the leading representative. Of the significance of this reaction Dr. Brewer has only the vaguest notion; and he does not make even an approach to the comprehension of Ferdinand's austere and fanatical character. He fails also to trace the influence of the Reformation on the relations of the princes to the Crown, to each other, and to the people; and he says hardly anything of the widespread desolation caused by the Thirty Years' War. His treatment of later periods is not quite so unsatisfactory, but it is in no respect worthy of the subject. The commanding element in the history of Germany since the Thirty Years' War is the growing power of Prussia. The general course of events can be made intelligible only if this is constantly borne in mind, and unfortunately it is often forgotten by Dr. Brewer.

The most daring historian might hesitate before deciding to include in his work an account of the development of German philosophy; but Dr. Brewer enters upon the task in a cheerful and confident spirit. He begins with the scholastic philosophy, his contempt for which, whether based on accurate study or not, is expressed in sufficiently emphatic terms. With a fine disregard of the consistency of figures, he denounces scholasticism as a "worthless battle of frogs and mice," an "everlasting disputation about goats' wool," a "theological minotaur," and a set of "cobwebs, to be swept away by the besom of common sense." Of Leibnitz we are informed that "he maintained that there are two kinds of monads or protoplasms, one spiritual and the other material," and that he considered pre-established harmony to be "the cause of the perfect sympathy and joint action of these two protoplasms." Kant's doctrine is summed up in the statement that, in his opinion, "phenomena are outward and sensible, noumena real but wholly ideal"; and Dr. Brewer disposes of Fichte's idealism by the remark that "the telegraph is not the telegram, nor does it make the telegram; it only conveys it or makes it known. So the human faculties do not create what they announce, but only convey the information to the brain, more or less correctly as it may be." The sections on literature are scarcely more luminous than those on philosophy. The works of Goethe and Schiller are described, but Dr. Brewer makes no attempt to investigate the conditions of national thought and life which prepared the way for these writers. Of the two, Schiller is the poet whom he admires the more strongly. He even maintains that Schiller is "the greatest poetical genius of modern times," and that "as a lyricist he is certainly equal if not superior to Goethe." Dr. Brewer has a right to his opinion, but in the

statement of facts it is as well to be accurate, and he is not accurate when he says that "before Schiller was twenty years old he brought out his play called *The Robbers*." He has formed a much less favourable judgment of Goethe, who, he contends, "is waning fast." He admits that *Faust* is "really a great poem, not without dramatic scenes"; but "what its object is," he adds, "it would be hard to say"; and he is convinced that the story of Gretchen (whom he calls Gretchin, and describes as "a soiled dove") "is certainly out of character." After this we are not surprised to be told that Heine's prose is "smart," but that it "has been buried in the limbo of forgetfulness"; and it seems hardly worth while to suggest to Dr. Brewer that in a sketch of German literature there ought to be some explanation of the rise and decay of the Romantic school.

#### FAIRY TALES FROM FINLAND.\*

WE often notice on the part of translators who take upon themselves to usher a foreign author for the first time before the English public a curious carelessness as to the reception which will be given to him. They think that if his name is mentioned on the title-page their duty to him is performed, and they do not care in the least about the impression which the particular work they have chosen may make upon the minds of readers curious to discover the secret of his reputation. The volumes before us form a flagrant instance of the carelessness in question. They introduce for the first time in an English dress the author who enjoys the greatest celebrity among living Swedish writers of the older generation; and it would seem natural to devote a prefatory page to informing English readers who Professor Topelius is, what he has done, and what position these fairy tales take in the body of his writings. But not one word of this is said. In very curious English the translator merely remarks:—"I now venture to submit to the English youth a selection of Zac. Topelii idylls. They have already found their way into the French, German, Danish, Finnish, and Russian tongues, which fact alone should guarantee that, like their kindred of H. C. Andersen and R. Gustafsson, they are endowed with delicate and everlasting beauty." To Mr. A. Alberg, who thinks that the Latin genitive is used in English writing, we might say in passing, Andersen we know and Topelius we know, but who is Gustafsson? This, however, is all the introduction he gives to his author, and even when, in the beginning of "Whisperings in the Wood," among the Swedish illustrations which are used, a portrait of the poet himself is introduced, no reference whatever is made to the fact. We therefore feel it due to the Swedish poet that in welcoming him for the first time on English ground, we should explain a little what manner of man he is.

Zachris Topelius was born in Finland, in 1818, nine years after that province was sundered from the Swedish realm, and by the Peace of Frederikshamn annexed to Russia as a Grand-Duchy. He has therefore been a Russian subject all his life, and cannot, as his great friend and master Runeberg could just do, remember the Swedish armies, under Döbeln and Kulneff, marching through the streets of Jakobstad. But notwithstanding this, he has retained through life a sort of pathetic echo of those great days of dismemberment and defeat, and his intellectual loyalty to Swedish is as deep and pronounced as his personal loyalty to Russia. Topelius is in many respects a typical Finlander; his books express the contentment and pacific sweetness of the Grand Duchy, which alone of all its dependencies has never given Russia any trouble, and which alone has never been tyrannized over or annoyed. The language of Finland is still Swedish in books and in business, in the Universities and in the courts of law. To the occasional suggestions of the Russian authorities that Russian ought to be cultivated, the Finns shrug their shoulders and answer that they have already two languages, Swedish and Finnish, and that life is too short for them to learn a third. A good-humoured appeal on the ground of laziness tickles a Russian tenderly, and it seems likely that Swedish will still be spoken in Helsingfors when Polish is no more heard in Warsaw or German in Riga. For Swedish literature this is a very beneficent providence, since, if we may judge the future by the past and the present, to prevent the Finns from writing Swedish would halve the productive power of the nation. From the earliest times Sweden has welcomed some of her most nervous and most original writers from the eastern side of the Gulf of Bothnia. Jacob Frese, almost the only genuine lyrical poet Sweden enjoyed in the seventeenth century, brought his characteristic Finnish melancholy with him from the extreme borders of Viborg; Kellgren, the most brilliant of Swedish satirists, was born at Åbo; the great lyricist Franzén, Fredrika Bremer, whose name is known throughout the educated world, Runeberg himself, the greatest name which adorns the annals of Swedish literature—all these and many more famous names would diminish seriously by their absence the lustre of their mother-country's history if Finland could have been annexed by Russia intellectually as easily as it was politically.

The writings of Topelius have always combined this Swedish tradition of style with a more secret and intimate tone of purely Finland feeling. He has been content to be a little provincial that he might be the more deeply patriotic; and he is, in fact, the

\* *Swedish Fairy Tales from Finland*, by Zachris Topelius. Translated by A. Alberg. London: George Allen & Unwin, 1881.

most characteristically Finnish poet that exists. His earliest labours were the oral collection of certain fragments of the *Kalevala*, which he was the first to observe, but with which his name has never been prominently identified, because he very early abandoned the whole theme to his friend, Dr. Elias Lönnrot, to whom the world owes the recovery and the publication of that extraordinary savage epic. In 1845 Topelius published his first volume of poems, called *Ljungblommor* ("Heather Blossoms"), songs and ballads of the woodland life of Finland—melancholy, tender, and sonorous verses, which exactly suited the temper of his countrymen, and which are constantly being reprinted. He has gone on writing lyrical poetry in the same key, but never with greater success than in this work of his youth. He has gradually become, as the chief writer of a small community so often tends to become, more or less encyclopædic; his writings embrace philosophy, science, fiction, and politics, all treated in a somewhat popular manner. He has written national plays for the stage at Helsingfors, and one at least of these, his tragedy of *Regina von Emmeritz*, has enjoyed a lasting success. But his most important contribution to literature, perhaps, has been his cycle of patriotic romances, entitled *Fältkärens Berättelser*, or "Tales of a Surgeon," which have found readers wherever the Swedish language is understood. Zachris Topelius is Professor of Latin at the University of Helsingfors, where, since the death of Runeberg in 1877, he is honoured as the principal writer of his native country. Late in life he has discovered a wonderful tact and charm in addressing children. A chatty volume about Finland, *Boken om vort land* ("The Book about our Country"), was so enthusiastically received that the poet determined to address himself entirely to the young, and with that intention composed the short "idyls," or fairy tales, of which two instalments are here presented to English children. They are written in the original in a style so simple and harmonious, and illuminated by so sweet and original a fancy, that the poet loses no dignity as a serious writer by acknowledging them. But to place them before us, as specimens of the works of Topelius, without any account of his career in general, is exactly like translating and publishing *The King of the Golden River* as giving an adequate idea of Mr. Ruskin's general scope and aim.

The manner of Topelius in approaching a childish imagination is far removed from that of Hans Andersen, with whom he has been very inconsiderately compared. To say the truth, the one is a cosmopolitan and the other a local writer. Andersen's wit and rapid ingenuities of plot appeal to the general instincts of mankind, and are as welcome to the small Hindoo as to a Danish or an American child. He is intelligible all the world over, and describes a life which, existing nowhere, might and should exist everywhere. To appreciate the charm of Topelius, on the other hand, it is desirable that we should know something of Finland, its desolate forests, its endless network of silver lakes, its gentle heathen population shrinking from sight of civilized things behind the mountains and in impenetrable morasses, its pathetic and yet glorious memories of the war of independence. These are all reflected in the stories of Topelius, and are taken for granted in such a way that a child ignorant of all these might receive the actual story with but a languid interest. Where they more particularly deal with nature, and give personal volition and intelligence to the inanimate world, they remind a reader strikingly of the best and earliest nature-stories of the late Mrs. Gatty—tales to the originality and beauty of which justice has scarcely been done. Topelius introduces us, in his fanciful way, to all parts of his great and melancholy province. Now we are with a herd of reindeer, rushing headlong across the vast frozen lake of Enare, far north of the Arctic Circle, while the dawn streams in crimson upon us from over the snow-white peaks of Mount Peldovi; scarcely one European can be found within fifty miles, and in the huge desolation the smoke of a little colony of Quaius is a rare feature in the landscape. Now we trudge, with a joyous company of children, from the little seaport town of Uleåborg up into the wide defiles where the cranberry grows, acre upon acre, with its pure waxy bell of rose colour in summer, and its rich purple berry in autumn. Now, in more thickly peopled regions, where the torrent has become a river, and lazily drags with it its wandering fleet of planks cut high up in the forest, we stand in the rainbow of the waterfall, where its cool spray mingles with the sharp smell of the saw-mill. Again, from some creek in the Gulf of Finland, under the shadow of the carefully guarded and tended cherry-tree, we watch the white sails flitting across the islands, and the gunboats going out to practise from some islet citadel—Sveaborg or Ruottelinni—which reminds us that Russia has sharp claws underneath the velvet paw she seems to lay so carelessly on the romantic Grand Duchy.

A characteristic story of the last class is "Gifts from the Deep." An old fisherman and his wife are the only inhabitants of a lump of red granite that stands far out to sea at the entrance of a frequented port. This islet, which is called Ahtola, is beautifully described. It contains the hut in which these people and their dog live, a few tufts of grass and sedge, one mountain ash, and four willow-bushes. The only things which grow upon it in a state of cultivation are a few leeks, which the old woman tends, in the shelter of a rock. The couple would be contented with their life if it were not that the old woman had long been secretly consumed by one mad and vain desire to possess a cow. One day a party of students come out to Ahtola in a boat and consume a great quantity of herrings, complaining bitterly that there is no other food to be had, not even milk. They further

explain that the name of the island shows that it is the stronghold of Ahti, who is king of the sea in the *Kalevala*, and they laughingly declare that the good wife should promise gifts to Ahti, and ask him for one of his cows. The students row home again; the old man laughs at their story, but his wife thinks of it over and over again. It is Sunday evening, and as they go out with their nets she murmurs an old incantation very busily, bringing in the name of Ahti. They return home and go to bed, but in the middle of the night they are waked up by a terrific storm; they hurry down to try to save their nets, but they see that it is quite impossible to go out in such a tempest, and presently, when the day dawns, they find their nets unbroken on the beach, bursting with silvery herrings. Behind the rock where the leeks grow, something is moving; the old woman can hardly believe her eyes—it is a cow, and as it complacently munches seaweed she is under no anxiety about its feed. From this day forward the old couple grow in wealth and happiness. Ahti sends full nets of fish every day, they build a house with the proceeds, more cows are washed ashore on stormy nights, and the heart of the fisherman's wife waxes prouder and prouder, till she determines to try and fill up the sea with stones, so as to form a bridge to the mainland. But the stones fall on the face of Ahti and wound him, so that in his anger he removes all his gifts, and she finds herself in her rags in the old hut, and her husband upbraids her with lying so long abed on a Monday morning; for it has all been a dream—cows and new house and fine dresses and all—even the anger of Ahti.

The translation of these stories is not conducted throughout in the same manner as the extract we have quoted from the preface; it is, on the contrary, careful and correct, although constantly betraying the fact that it is a translation. At its best it is, however, only fair to Professor Topelius to say that it gives no idea of his clear and limpid style.

#### MORE ABOUT THE FRENCH POLICE.\*

THE third volume of the *Mémoires de M. Claude*, which has just appeared, will in all probability greatly disappoint the readers of the first two. There are no astonishing revelations, no accounts of patriotic ladies who, while devoting themselves alternately to a conspirator and an emperor, sought to weave a net in which to entrap the latter; and no personage appears so striking as the beautiful and terrible Mme. X—, who in the latter half of the nineteenth century was able to act in real life the part of Lucrezia Borgia, and to inform a gentleman with whom she had breakfasted that he was poisoned, and that, like Mark Twain's duellist, he had better inquire for the nearest undertaker. Of Troppman's crime, the deep political significance of which was to be explained in the third volume, nothing is said, and the stories relating to people still living, which have been hinted at, are not forthcoming. Perhaps the revelations of the communicative policeman were too scandalous, and actions for libel were feared. Perhaps it was found that, with some expansion, there was matter enough for four volumes, and the editor has reserved the most remarkable narratives for the last. In any case, this third volume seems dull in comparison with its predecessors. There are some strange stories which would be worth attention if they could be believed; and there are some very disgusting pages which should never have been allowed to appear, and much information about murderers and thieves; but there is nothing like the wonderful statements respecting the doings and adventures of the rulers of an Empire which were contained in the first two volumes of M. Claude's edifying memoirs.

A good deal, however, can be found in this volume to gratify those who love to look at the criminal side of human nature; and some of the stories told, though not so remarkable as those which have come before, are certainly startling, if true. Unfortunately, it is impossible not to feel the gravest doubt as to their truth, and it seems likely that this volume will be little believed in and that it will shake to some extent belief in the two previous ones. It begins soberly enough, with a sketch of the organization of the French police under the Empire. From this it appears that, besides 800,000 francs contributed by the city of Paris, nearly 5,000,000 francs were allotted to the prefecture from the public revenue for police pay. These sums, however, though certainly not inconsiderable, formed in reality but a small part of the amounts spent on the police service. "Veut on connaître exactement le chiffre des fonds régies par Napoléon III.," says M. Claude; "ils étaient de 14,000,000 de francs." This seems a goodly sum for secret service money, expended on one section of the police only; but of course the question is, whether M. Claude's statement is true. As to this, readers of his narrative—or rather of what purports to be his narrative—must judge for themselves, as probably there are no means of verifying or disproving his figures. If the accounts of the police under the Empire have not been destroyed, it is very little likely that they will be published. After dealing shortly with this part of his subject, the writer proceeds to tell the story of a "nabab" who had five wives living in different countries; to describe the usages of *chevaliers d'industrie*, "picks-pockets," and murderous burglars; to give an account of a case of vitriol-throwing by a jealous wife, and of a vile crime committed with the aid of chloroform. Then come a very dull chapter about "les gens de théâtre et gens de lettres," and a very disgusting one, which

\* *Mémoires de M. Claude, Chef de la Police de Sécurité sous le Second Empire*, Paris: Jules Rouff.

should never have been published. The filthy and abominable story told in this is followed by a portion of the memoirs which ought to be interesting. It is headed "Une arrestation du citoyen Blanqui," and the reader naturally expects to find in it a clear and intelligible account of the manner in which this very famous conspirator was tracked down by the most dexterous of *policiers*; but, alas, he is doomed to disappointment, for M. Claude and his editor offer nothing of the kind. Either the narrative is altogether fictitious, or else the editor has not been able to understand M. Claude's account. The absurdity of the story told will be best proved by a brief analysis of it.

Blanqui, says the veracious historian, took advantage of the general amnesty which followed the rigours of the Espinasse Ministry to re-enter France, and the police were soon informed that he had come from London *via* Belgium, and had made his way to Paris. It was, however, one thing to know that Blanqui was in Paris, and quite another thing to lay hands on him there. He was, says M. Claude, "*passé maître dans l'art de dérouter toutes les pistes.*" As Blanqui passed much of his life in prison, his skill must frequently have deserted him; but nevertheless it may well be believed that he was not easily caught. On the occasion he altogether eluded the favourite Corsican spies of the Emperor, who were set on his trail; but two French detectives succeeded at last in discovering that he was stopping in a house near Montparnasse with his sister and a "*citoyenne Fremau*," who were devoted to him. Strange to say, in spite of Blanqui's well-known subtlety, no attempt was made to seize him on the day of the discovery. Early next morning some police officers went to the house indicated, but, as might have been expected, the bird had flown. Blanqui, "*qui sentait toujours de loin son mouchard*" had doubtless found out during the evening that the spies had been close to him, and had taken the very natural and obvious precaution of leaving the neighbourhood. In the house which had been occupied by him the police found, however, Blanqui's sister, Mme. Antoine, the "*citoyenne Fremau*," and an elderly workman, who, when they entered, was engaged in chasing some silver plate. From not one of these three could anything be extracted; but on searching the workman, a piece of paper bearing what M. Claude calls "*l'anagramme de Blanqui*" was found. It was, in fact, nothing but a series of words, the first letters of which formed the conspirator's name. They were arranged in a column, and were as follows—Bonheur, Loi, Amour, N'ont Qu'Un Instant. This, of course, was not an anagram, but we can forgive the chief of police for not knowing the true meaning of a word coined from the Greek. It is less easy to forgive him for trying to gull readers with a childish story. He asserts that from this paper he discovered what an American would call the location of the redoubtable Republican. Most singular, certainly, was the deduction he formed. The workman, after a time, was set at liberty; but, by M. Claude's orders, was carefully followed, and was seen to go to a house in the Rue des Trois-Bornes. When the *chef de la sûreté* was informed of this, everything became clear to his detective intellect. The "*anagram*" was explained. Blanqui begins with a B, so does Bornes. The conspirator was to be found in some street the name of which began with one of the letters of his surname. With this marvellous indication, discovered by the genius of the great detective, the spies were set to work; and certainly, if a slang expression may be pardoned, they had their work cut out for them, as they had to examine all the streets of which the names began with any one of seven letters. Perseverance and liberal expenditure brought about, however, the desired result. Blanqui was sought in vain under the letter B, under the letter L, under the letter A, but was discovered under the letter N. After a month's hunt he was found in a house in the Rue des Nonandières, and the great detective triumphed over the great conspirator. It is unnecessary to point out the absurdity of this ridiculous narrative. If true, it would mean that Blanqui's friend and co-conspirator was unable to remember his chief's name. He had to carry about with him a paper, which was certain to compromise him if he was seized, for fear he should forget that this chief was one Blanqui. At the same time, he had to remember, unless he kept a directory constantly at hand, all the streets in Paris the names of which began with any one of seven letters. Most readers will find it difficult to understand how such nonsense can have been deliberately published.

This remarkable story is followed by a variety of others, some of which may very possibly be true, and by a horrible account of the last days of M. Claude's friend and protector, the Sénateur de L. so often mentioned in the two preceding volumes. After this ghastly narrative comes a cheerful one, which seems at first sight to bear the stamp of truth, for in it the famed *chef de la sûreté* frankly tells how he himself was egregiously taken in by two arch swindlers at the Paris Exhibition of 1867. He was, he says, walking about the galleries of the huge building on the look-out for the knaves whom it was his duty to hunt down, when he was accosted by a large, red-bearded man who tranquilly announced himself as being Olarscovitch, *chef de police anglaise*, and said that he had been sent to look after the English "*picks-pockets*" who were infesting the Exhibition. M. Claude, unsuspecting for the moment, was easily led to believe the statement, and was delighted to meet the English detective who, he thought, would help him to lay hands on an English thief who had recently committed a serious robbery. An urbane conversation took place between the two guardians of society, and M. Olarscovitch insisted on M. Claude's breakfasting with him forth-

with. The Frenchman politely acceded, and went with his companion to the well-known English restaurant which was attached to the Exhibition, and there Olarscovitch pointed out the prettiest of the barmaids serving behind the counter, and said that she was a clever criminal, and was probably the person who had committed the theft. The girl, asked to join them, came, chatted pleasantly, and explained with agreeable frankness that she was no better than she should be, and that she had been in prison. M. Claude drank some champagne, and noticed that at one time the lovely but abandoned barmaid kept closer to him than was absolutely necessary. Leaving them after a time, and politely saying "Good evening, sir; bonsoir, monsieur"—which was a remarkable salutation, seeing that they had only just finished breakfast—she returned apparently to her work at the bar. Shortly afterwards the Englishman disappeared on a sudden pretext, and before quitting the restaurant M. Claude noticed that the fair barmaid also had gone. He remained, however, unsuspecting until he had occasion for his purse, and then he discovered that his pocket had been picked, and came, not very quickly, to the tolerably obvious conclusion that he, the great *chef de la sûreté*, had been the easy victim of two adroit thieves.

Now at first sight this story might seem to be substantially true—apart from the oddity of the remarkably un-English name—for, when a man describes his own defeat, he is usually speaking the truth. A little consideration, however, will show that it is no more worthy of belief than the tale about Blanqui's anagram. Every Frenchman who holds an office is more or less of a bureaucrat, and it is improbable in the extreme that the man at the head of the *police de sûreté* would at once accept the mere statement of an utter stranger that he was one of the chiefs of the English police, despatched to Paris by the English Government. A representative of the *préfecture de police*, accosted in this manner, would, we venture to say, inevitably have asked the other why he did not present himself in the regular manner, and would have demanded some official guarantee for the truth of his statement. He would have laughed at the production of a card. It is well known that swindlers are invariably ready with cards. Then the story alleges that one of the girls who served at the English restaurant of the Exhibition of 1867, was a notorious thief, and that she suddenly disappeared with her accomplice; and near the end of the volume M. Claude describes how, after they had committed a series of thefts together, this accomplice, who had already committed one murder, poisoned her. If such things had ever happened, they must have been known, and there can be small doubt that the tale of the robbery at the Exhibition and of the subsequent career of the two thieves, is entirely fictitious. Equally unworthy of belief are the statements repeatedly made in this volume, that thieves habitually keep articles of value, which they have stolen, in the safes of the "Safe Deposit Company." Certain of the stories told may be true, or may rest on a basis of truth, but the samples we have given show what nonsense has been inserted, and necessarily throw great doubt on the whole of the third volume. Possibly, as we have said, it is nothing but a result of the process known as bookmaking, and a narrative has been greatly expanded and added to, in order that a fourth volume may be produced. For this, perhaps, something that is really interesting and really trustworthy has been reserved.

#### BOULGER'S HISTORY OF CHINA.\*

THE history of China, like that of most Oriental States, begins in the cloudland of mythology, with Emperors possessing the attributes of gods and the physical features of monsters, who governed their subjects with superhuman wisdom, and lived to preternatural ages. When in after-times it introduces us to sovereigns of mortal mould it causes to pass before us a succession of monarchs, good, bad, and indifferent—their courts, their councillors, their imperial acts, their campaigns, their victories, sometimes their defeats, and their deaths. It is a spectacle of courts and camps. The actors on the stage are in full dress, and leave little room for the people, who for the most part are kept behind the scenes. The reigns and careers of the rulers are pictured in full detail, but the facts which govern their fates are considered unworthy to be brought into the category of living and interesting life-history. Thus there is necessarily lacking in the Chinese annals that living record of the nation which adds so much to the interest attaching to the modern history of European States.

As historical compilations, the Dynastic Annals of China are monuments of patient industry. Each dynasty as it has succeeded to power has published the records of the reigns during the preceding period, and to them have been added detailed accounts of the system of government, the ceremonies, punishments, sacrificial rites which prevailed—together with notices of the astronomical observations, the geography, the literature, the celebrated officials, the neighbouring States, &c., which belonged to the same time. By a careful comparison of these various parts a faithful picture might be pieced together of the history of the age; but no one who has ever dipped into the Dynastic Annals would be bold enough to dream of being able to make himself completely master of more than one or two out of the twenty-four in

\* *History of China.* By Demetrius Charles Boulger. Vol. I. London: W. H. Allen & Co., 1881.

the course of a long life, and therefore any one undertaking to write a history of China from Chinese sources must of necessity confine himself to the records of the reigns of the Emperors, even if he does not betake himself to Oh'u Hi's celebrated epitome of the history of China. This last was the text chosen by De Mailla upon which to found his *Histoire générale de la Chine*, which in its turn has served as a basis for Mr. Boulger's portly volume. We confess that we opened Mr. Boulger's work with some misgiving. The idea of having to wade through an epitome of De Mailla's translation was not encouraging, and we sat down to our task prepared for the worst. But, fortunately for us and for all other students of Mr. Boulger's History, the anticipated successions of dynasties, reigns of Emperors, and courtly acts are evidently in his eyes no mere dry bones of history, but are clothed in mortal form and are gifted with life. He has taken up the study with enthusiasm, and has imbued himself so thoroughly with the national instincts and proclivities that he has succeeded in infusing interest into that which in other hands would have been a monotonous record of facts, and has produced a work which is not only valuable as a book of reference for students, but which, by his manner of treatment and the lucidity of his style of writing, is likely to attract the attention of many to whom the history of China has been as little known as that of the Kings of Dahomey or the Khans of Bokhara.

But, from the nature of the source from which Mr. Boulger has gathered his information, he has been obliged to keep within the bounds set by the Chinese annalists. Like them, he begins with a semi-mythical account of the Emperors Fuh-hi, Shin-nung, and Hwang-ti, and he accepts the inferred belief that the Chinese were the aboriginal inhabitants of China. To this modern research takes exception. A number of ethnological and linguistic facts point to their having left a home in the south of the Caspian Sea, where they had been brought under the influence of Accadian culture. From this resting-place they moved eastward about the twenty-fifth century B.C., probably in consequence of the invasion of Susiana by some possibly Turanian tribe; and finally struck the northern bend of the Yellow River, the course of which they followed until they reached the fertile plains of Shensi. Such an emigration is not unusual in Asia. History tells us that the Ottoman Turks had their original home in Northern Mongolia, and we know that at the end of the last century a body of six hundred thousand Kalmucks migrated from Russia to the confines of China.

It is important also to bear in mind that the Chinese immigrants found the country in possession of a number of Taic tribes, such as the Kwei, Lung, Pung, and Li, all of whom possessed a certain amount of culture. With these tribes they contended for dominion, and by force of a superior civilization gained the mastery over them. The relations thus established produced effects which have left their mark on the history of the nation through all time. In the language at the present day, as well as in the traditions and customs now existing, are reflected traces of this intermingling of races more than four thousand years ago. The admixture of Taic blood was also of paramount importance to the Chinese, and the fact has been too much overlooked that the Chinese owe much of their endurance as a nation, and of their superiority in mental and bodily physique, to the constant introduction of new blood into the national life. During the first centuries of their residence in China they were surrounded, as we have seen, by Taic races, and later on at the close of the Chow dynasty there rose to power the Prince of Ts'in, who occupied the Empire with his subjects, in whose veins ran blood which owed its origin as much, or nearly as much, to the Altaic races which bordered on the modern province of Kansuh as to the original Chinese stock. Mr. Boulger's work affords evidence of the existence also at this time of a purely foreign element in the Empire which had assumed such importance that an edict was issued for its elimination. Fortunately, the edict was recalled before it became law, and the foreigners were amalgamated with the Chinese. In the same way Mr. Boulger tells us of repeated invasions of the Huns, the Yueti, the Sien-pi, and other northern tribes, who recognized no frontier between their own territories and those of China, but kept up a successive interchange of friendly and warlike relations with their southern neighbours. On the southern and western frontiers a like intercourse existed between the Chinese and the bordering aboriginal tribes, so that on all sides there was a constant influx of foreign blood into the Empire.

In the beginning of the tenth century of our era the K'itan Tatars possessed themselves of the northern portion of the Empire, and thus for the first time in Chinese history a confessedly foreign dynasty was established within the limits of China. After two centuries of sovereignty the K'itans had to submit, at the hands of the Nü-chen Tatars, to the same fate that they had inflicted on the subjects of the T'ang dynasty, and in like manner the Nü-chen were compelled to yield in the beginning of the thirteenth century to the overwhelming forces of Jenghiz Khan and his successors. At the fall of the Yuen dynasty (1368) the throne once again reverted to the original line, and for nearly three centuries a succession of Chinese sovereigns ruled over their ancient inheritance. But once again a foreign yoke was destined to be imposed on the patient necks of the "sons of Han," and in 1644 the Empire again fell into the hands of Manchoo conquerors, whose sway is still paramount from Siberia to Annam, and from the China Sea to the frontiers of India.

But through all these changes there runs an unbroken historical continuity, which, however, is not so much apparent in Mr. Boul-

ger's phase of Chinese history as in the life of the nation. In the work before us we hear nothing, for example, of the seal form of writing invented in the eighth century B.C. by She Chow, which exercised such a powerful influence in maintaining the connexion between the several States into which the country was divided during the Chow dynasty, and which contributed so largely to confine the effects of the transference of power from the Chows to the Ts'ins to a change of rulers; nor of that intermingling of races of which we have already spoken, which so effectually mitigated the violence of that and of all subsequent changes. And it is noticeable that not only was this intermingling of races beyond the frontier partly due to these changes, but the success which attended the later invasions of the Empire by the border tribes was directly traceable to them, since at the close of each revolutionary period the leaders of the defeated faction sought refuge from their victors either among the tents of the northern peoples or in the huts of their southern neighbours. The *élite* of the Empire were thus repeatedly driven into exile, from which their descendants returned to fight the battles of their fathers over again. In the same way we hear little of the influence exercised by the teachings of Confucius, Laou-tze, and Mencius on the destinies of the nation. All these subjects are beyond the scope of Mr. Boulger's work, in which we are required, by the necessities of the case, to look from a particular point of view on a particular branch of Chinese history.

But, as this branch of the history extends over a period of 2,500 years, and as Mr. Boulger has instinctively seized on the leading facts relating to it, his work naturally contains much which is pregnant with useful lessons for this and for all ages. One point which stands prominently out in the narrative is the indomitable perseverance with which the Chinese follow up any undertaking, whether of peace or of war, when once they have put their hands to the plough. Whether we turn our eyes to the Great Wall, which stretches alike over mountain-tops, and plains, and valleys, along the entire length of the northern frontier of the Empire; or whether we follow the fortunes of Oh'ang Keen and his companions, who, in the second century B.C., marched across Asia in search of the wandering Yueti; or of General Panchow, who, three centuries later, led an army to the shores of the Caspian Sea; or whether we follow in the track of the armies which at different times invaded Tibet, Corea, Annam, and Burmah, we are met at every turn by evidence of the same steady, plodding fixity of purpose which has been so conspicuously displayed in the recent campaigns against the Panthays in Yunnan and Yakub Khan in Kashgaria. The fact that such a characteristic is the birthright of a nation of three hundred millions suggests at once the possibility that it may become at some future period a lever by which China may move the world. But this can never happen as long as Chinese warriors wear petticoats, or as long as mandarins emulate the example of the Russian Admiral who cheated his Imperial master into the belief that the wooden turrets of the iron-clad *Peter the Great* were solid iron, by substituting gilded pieces of bamboo for the brass "sights" of their new Krupp guns.

Mr. Boulger's present volume takes us down to the close of the Yuen Dynasty, which was founded by the genius of Jenghiz Khan, and we are promised the second volume before the end of the year. His object, he tells us, in undertaking this task, was to popularize the little-understood history of China. In this object he deserves to succeed, for he has presented the long succession of reigns, the constant wars, and the repeated changes of dynasties in a more readable form than they have ever assumed before. Gützlaff's history approaches it nearest, but it falls short of it in general interest. The difference between a literary labour of love undertaken by a writer of imagination, and a work which appears to bear the marks of what the Chinese call "ploughing with the pen," represents the relative merits of these two works. We are by no means inclined to agree with Mr. Boulger's estimates of all the characters he describes, or with his opinion of the importance or non-importance of all the events he chronicles. But nevertheless he has fairly reflected in his pages an epitome of the Imperial annals of the Empire, and has succeeded in bringing dry records, full of difficult and unfamiliar names, into the realm of living history, and in making characters which from the strangeness of their surroundings are apt to be regarded as lay figures stand out from his canvas as real personages.

#### THE TREASURY OF MODERN ANECDOTE.\*

MR. DAVENPORT ADAMS is once more at his old trick of borrowing and blundering. He boasts as to his latest production that his "collection of anecdotes differs from its predecessors in several particulars. To begin with, it is strictly a treasury of modern anecdote. . . . For the most part the anecdotes in this collection are emphatically modern—modern in so far that they are drawn from modern sources. . . . We have drawn particularly," he says on another page, "upon such books as Gronow's *Reminiscences*, Greville's *Diary*, Crabb Robinson's *Diary*, and, to come further down, J. C. Young's *Diary*, and J. R. Planché's

\* *The Treasury of Modern Anecdotes; being a Selection from the Witty and Humorous Sayings of the last Hundred Years.* Edited, with Notes and Introduction, by W. Davenport Adams, Author of the "Dictionary of English Literature." &c. Edinburgh: The Edinburgh Publishing Company. London: Simpkin, Marshall, & Co. 1881.

Recollections." When we turn to the index we find such entries as the following:—"Rogers, Samuel, his *Table Talk*, quoted *passim*"; "Grondow, Captain, his *Diary*, quoted *passim*"; "Robinson, Crabb, his *Diary*, quoted *passim*."

The compiler, or appropriator, or conveyer, or—to give him the title which he gives to himself—the editor of these extracts believes that the public is tired of the old stories that generally do duty in such a collection, and is ready to welcome this Treasury. "It will be acknowledged," he says, "that for whiling away a dull afternoon or a spare half-hour, few things more suitable could be devised than a book of anecdotes. It would seem that a photograph album is sometimes made to do duty on such occasions; but the superiority of a book of anecdotes will readily be allowed." So far Mr. Adams is certainly modest enough. We will not argue the point, but will readily allow that there is at least one of his compilations which is less dull than a photograph album. But he goes further than this. A wholly new and good anecdote is, he assures us, "welcomed as a 'thing of beauty,' and mentally recorded as a 'joy for ever.'" Now, his anecdotes must be taken as both good and wholly new; for do they not, as he himself maintains, contain the cream of spoken wit and humour, and are they not "emphatically modern"? Let us turn, then, to an example of a "thing of beauty" and a "joy for ever":—

A story has been told (says Lord Wm. Lennox) of a noble lord, still flourishing (1876), who upon saying to a keeper, "I suppose you've scarcely ever met with a worse shot than I am?" "Oh yes, my lord," responded the other, "I've met with many a worse, for you misses them so cleanly."

Does the reader welcome this poor story as a "thing of beauty," and does he record it as a "joy for ever"?

But Mr. Adams's collection has, besides its newness, another great quality. What people want, he says, is, that anecdotes should be authentic. "That is the whole secret of the value and usefulness of anecdotes, that they should be, as far as possible, genuine and traceable. If they are not, they are useless. They may excite a careless or an ignorant laugh, but that is all. . . . It is on this principle that the present collection has been compiled, and it is hoped that it will, on this account, appeal powerfully to the taste and judgment of the true connoisseur of anecdote." Certainly Mr. Adams has traced to what he calls a genuine source the anecdote we have just quoted. We have no reason to doubt Lord William Lennox's statement that in 1876 the noble lord was still flourishing to whom the game-keeper thus responded. But for all that the anecdote seems almost as stupid as Mr. Adams's preface and introduction. His writings, as we have, we believe, pointed out before, certainly have one great advantage. For a time they amuse his readers by leading them to try to track him through all the windings of his blundering. Thus in the introduction we read that "the sayings of academic humorists have an obviously academic tinge; the epigrams of a Parr, a Porson, and a Davidson are the evident product of the scholarly life." Who is Davidson? we began to think. We could make nothing of him, nor did Mr. Adams's index help us at all; for though he boasts of its fulness, yet the name of this academic humorist is not given. At last, by a happy conjecture, we hit on an emendation of the evidently corrupt text that was not unworthy of Porson himself. For Davidson read Donaldson. Of that scholar more than one anecdote is recorded. Still more wonderful are the blunders into which Mr. Adams falls when he recounts two sayings of Sir John Maynard. They are given together, but, unfortunately for our compiler, one comes at the bottom of a page, and the other at the top of the next. On the first page he had given Maynard's name quite rightly, but in a footnote to the second anecdote he calls him "Sir John Maywood." To add to the confusion, in the index the old lawyer becomes Lord Chancellor Maynard. It is hard, by the way, to see why these two anecdotes are given in a collection whose boast it is that it is emphatically modern. One of them certainly is found in Burnet's *History of his own Times*, while Maynard was born in Queen Elizabeth's reign. But to pass on. Our readers may remember that Mr. Adams, in a late work, in which he ventured to speak with an air of authority of Swift, showed himself so ignorant as to confuse the Earl of Orford with the Earl of Oxford. We pointed out his blunder, but pointed it out in vain. In the book before us he again calls Horace Walpole, Earl of Oxford. At the same time, whether from mere carelessness or not, he sadly mangles one of Walpole's stories. He thus gives it:—

Grossatesta, the Modenese minister, a very low fellow, with all the jack-pudding-head of an Italian, asked, "Mais qui est ce qui représente mon maître?" Wall replied, "Mais, l'abbé, ne savez vous pas que ce n'est pas un opéra bouffon?"

Walpole, by the way, did not write "jackpudding-head," but "jackpuddinghood." That error, however, is of but small moment. It is in Wall's reply that Mr. Adams makes his real blunder. *Bouffon*—or *bouffon*, as it ought more properly to be written—has become in his version *bouffou*, and after the word *Mais* has been struck out, *Mon Dieu*. Mr. Adams, we remember, occasionally works for the Society for Promoting Christian Knowledge. He may have thought that *Mon Dieu* was too profane for quotation. In like manner in reporting Thurlow's famous answer to a deputation of Dissenters, he makes the Chancellor say to them, "If you can get your religion established, I'll be for that too." Every one knows the anecdote, and will at once notice the omission of the strong term which his Lordship applied to the petitioners' religion. This squeamishness on Mr. Adams's part is a little hard to under-

stand, as he reports the beginning of the answer correctly enough, and has no hesitation in making Thurlow say, "Gentlemen, I'm against you, by G—d. I am for the Established Church, d—mme." However, he does not treat Lord Thurlow worse than by weakening the force of his language. Other Lord Chancellors do not fare so well at his hands. Lord Eldon, for instance, he says, was born in 1781. Later on he mentions the well-known saying of Horne Tooke at the time of his trial for high treason. The Attorney-General, he says, was "Scott, Lord Eldon." He certainly should have said Scott, or Sir John Scott, afterwards Lord Eldon. But to pass this by. If Lord Eldon was born in 1781, he was but thirteen years old when he was Attorney-General. In that case the wonder is, not that he had so small a patrimony to leave to his children, but that he had any children to whom to leave anything at all. In another passage we find a story told of Lords Eldon and Leach. Lord Leach is no doubt Sir John Leach. On one page a note to Erskine's name tells us that he was "the orator and wit." On another page a second note tells us that he was Lord Chancellor. Kenyon is simply described as "the judge." Bishop Blomfield three times becomes Bishop Bloomfield, and Bishop Pretyman becomes Bishop Prettyman. The birth of Lord Oastleragh is placed in 1796, so that he was not yet six years old when he became President of the Board of Control. If his life is cut short at one end, Coleridge's is shortened at the other. His death is placed by Mr. Adams in 1824. Has he never read those fine lines of Wordsworth's:—

How fast has brother followed brother,  
From sunshine to the sunless land!

Does he not remember how the poet mourns over Crabbe, Scott, Coleridge, Lamb, and Mrs. Hemans, who had all died within a space of only a few months over three years? But what, after all, are errors in dates compared with the blunder into which he falls when he assigns the line, "Thou great first cause, least understood," to Milton? Author as he is of a Dictionary of English Literature, does he not know Pope's style, and has he never read his "Universal Prayer"? After this even his Latin and Greek, peculiar though they are, scarcely raise our astonishment. Yet we cannot pass them over in silence. He quotes Porson's doggerel lines which begin "Poetis nos letamur tribus." For *nos* he prints *non*. Two pages earlier we have the following specimen of his Latinity:—

Grates agimus (sic) fatis,  
Habnimus (sic) satias.

His Greek, as we might expect, is even worse. *Τί θύηκε Φίλιππος* he gives as the Greek for "Is Philip dead?" His French is scarcely better than his Greek. Thus we find *Comédie*, *Un Héro*, *Pitiè*, and *nous seriez*.

Perhaps the most ridiculous part of the book is to be found in two of the anecdotes which Mr. Adams quotes from Mr. Trevelyan's *Life of Lord Macaulay*. Every one will remember how Macaulay, when he was about four years old, was scalded by some hot coffee; and how, when asked how he felt, replied, "Thank you, madam, the agony is abated." This anecdote, interesting enough in its proper place, is given by Mr. Adams as an instance of either a witty or a humorous saying. By the way, in copying it down he manages again to fall into his old blunders and writes of the Oxford (sic) Collection at Strawberry Hill. On another occasion, Macaulay, in his childhood, said to his mother, "Yes, mamma, industry shall be my bread, and attention my butter." This surely is inserted here by mistake. It has got into its wrong pigeon-hole. It has nothing to do with wit or humour, but should appear in *The Collection of the Priggish Sayings of Great Men in their Childhood*. If Mr. Adams has not thought of this publication, we at once place the suggestion at his full disposal, so that he may not be tempted to any further acts of borrowing. It would make a most worthy addition to his already voluminous compilations.

#### BUSH LIFE IN QUEENSLAND.\*

THERE are two ways of giving to the world experiences gained in a strange and colonial life. One is for the pioneer of civilization to sit down and write an unvarnished account of the means he took to "squat" in Australia or to buy and stock a farm in Auckland; the other is to weave a good many real incidents into a story with fictitious names, a love plot or two, and the usual incidents of a modern novel. Mr. Grant has adopted the latter method, and introduces us to a hero, John West, the son of a struggling curate, who had been induced by the glowing descriptions of Mr. Cosgrove, an old schoolfellow, to embark his savings of 1,500*l.* in the purchase of a sheep and cattle farm in Queensland. John West sails for Sydney and then goes north or up-country to Mr. Cosgrove's station of Cambaranga. Here he goes through a variety of incidents; is cheated by his patron; starts a farm on his own account; is initiated into the mysteries of driving herds of half-wild cattle; rides buck-jumping horses; struggles against climate, losses, and adverse fortune; lights at last on a gold-mine; falls in love and finally marries Ruth, the stepdaughter of Mr. Cosgrove. There are one or two other love passages in these volumes. Mr. Stone marries Beattie Gray, and Mr. Fitzgerald is rejected by Ruth in favour of John

\* *Bush Life in Queensland; or, John West's Colonial Experiences.* By A. C. Grant. 2 vols. London and Edinburgh: Blackwood & Sons. 1881.

West, and finally marries Mrs. Stone's sister Phoebe. Inevitably, too, in a tale of life in the Bush, there must be a villain, appropriately named Cane, who thinks nothing of shooting half a dozen natives on a prospecting trip, and who, in endeavouring to rob an Englishman named McDuff, ends by shooting him in order to avoid detection. In the original plan of robbery he has for an accomplice Ralf Cosgrove, the half-brother of Ruth—a miserable, scampish, good-for-nothing colonial waif. In the end this worthy couple are not tracked by the police and tried by a judge and jury at Brisbane, but are killed by the aborigines—that is to say, the Myalls or natives spear Bill Cane the murderer of McDuff, and wound the wretched Ralf who dies of fright and exhaustion in the arms of John West. There is nothing in all this which proves any art in the construction of a plot or the delineation of character, though we concede to Mr. Grant no inconsiderable powers of description. But the pictures and episodes of Bush life are really striking and graphically told. There is very little, we should say, taken at second-hand. Some of the descriptions of scenery are admirable; the details of camping out, tracking errant cattle, running up log huts, searching for gold, evading or watching natives, washing sheep, crossing swamps and rivers, are lifelike and unlaboured, and the language is never stilted. We can scarcely doubt that most of the episodes can be vouched for or capped by settlers in the most tropical of our Australian colonies.

We remark that these volumes brist'le with almost as many odd terms as an Anglo-Indian Blue-book about *putni Tulooks* or *puttidari* tenures. And we have specimens of pigeon-English put into the mouths of black boys, which are hardly intelligible with the footnotes. We subjoin a few specimens, freely admitting that some expressions are beyond our power. A *Currobores* we have already heard of in other Australian publications. It is a meeting of the tribes to dance and sing to some air composed by a gifted creature who is suspected of magical art and is *en rapport* with the Spirit of evil. A Boodgerree is apparently the native term for a good fellow, and sounds suspiciously like a corruption of the Hindustani *bahut aacha*, or very good. By a *Cawbawn humpy* is signified a fine one-storied house, with an iron roof and a broad verandah, a residence not often met with in the diggings. A scrubber is not, as might be imagined, a servant of all work, receiving exorbitant wages, but a cow or bullock that has taken to the scrub or bush and has relapsed into savage nature. A calf is said to be "scruffed" when it is caught by the hand, the expression, we presume, being taken from the scruff of the neck. Tailoring cattle means to herd or look after them. *Yabber* is Queenslandish for talk, and *bail* for not, or no; *bong* means dead. A Jack Shay is a tin pot used for boiling water for tea, and so contrived as to hold within it another pot of about half its size. A "crush lane" can be guessed at from the context, which shows that it is a long passage, into which a single bullock or a single horse is admitted. But what are we to understand by the intimation that at the end of this "crush lane" there is "a bail for spaying"? As far as we can make out, it must be a sort of *impasse*, in which cruppers and saucingles and head-stalls are fastened on refractory colts. Similarly we can understand that a grey horse that moves stiffly, humps its back, holds its tail close to the body, and is believed by highly competent judges to be sure "to buck a docker," must be a singularly unpleasant animal to lead or mount. We can conceive none better fitted for the talent of the late Mr. Rarey. In one passage we notice what appears to us a curious error in the points of the compass. An exploring party leaves Brisbane to survey an unknown part of the interior. From some ridges they get to a salt-water creek, and, as we read the narrative, then run down the coast. Here they manage to see the "setting sun, amid a blaze of gold and purple, dipped beneath the waters of the Pacific." How this extraordinary sight could be witnessed from any part of Queensland or its coast can only be explained by the sun rising in the west and setting in the east, as any one may see by a glance at a map. It is curious that a very similar error is to be found in one of Scott's very best novels. The late Colonel Mure, in his *History of Greek Literature*, while explaining away the irreligious and Wolfian theory about the Iliad and Odyssey, showed that more remarkable discrepancies than any in Homer were to be found in writers of a more civilized age, who were provided with many more mechanical aids to correct composition—Dante, Virgil, and Scott—to say nothing of Shakespeare. Now, in *The Antiquary*, in the celebrated scene at the Ilknot Head, where Sir Arthur Wardour, his daughter, and Edie Ochiltree, are hemmed in by the tide, the setting sun is represented as showing his fiery disc above the waters of the German Ocean. Either, then, argued Colonel Mure, in Scott's cosmogony the sun sets in the east and rises somewhere else, or else that famous chapter is an interpolation by a different hand, as so many of Homer's episodes are said to be by some destructive critics.

This is an odd slip for a writer who, as we have said, has a keen eye for natural beauty. The picturesqueness of Queensland lies in its runs and ridges and upland pastures. The author does not write of the aborigines in the contemptuous terms not uncommon with settlers; but his picture of the blacks is not inviting. They emit an odour positively repulsive. Even the cattle dislike it, and sometimes "stampede" when they come across the recent track of a party of pungent aborigines. By sleeping under the skins of opossums and thick blankets, and by living in the close atmosphere of a hut of bark, these tribes lose hair and youth, and their dogs share the same fate and become blear-eyed and hairless. Besides the well-known boomerang, these savages use other weapons, *nul-lah-nul-lah*, paddy-melon sticks, and *heelimen* or shields. They consume

tobacco largely if they can beg or steal it, and live on 'wallabies' opossums, and kangaroos. They are also quick at discovering a "sugar bag" in the woods—in plain English, a comb of wild-honey. Game is, however, not one of the attractions of Queensland. The dingoes or wild-dogs are great nuisances, and prove most destructive to sheep. We are not surprised to hear that they are knocked on the head summarily, like the prowling fox in St. John's speech about Strafford or in Scott's poetry, and are destroyed by poison on a large scale, to which end every shepherd is furnished with a bottle of strychnine, and poisons the carcasses of the dead animals he finds in the Bush. Where population is scanty and the runs are large this practice may be necessary and not prejudicial to valuable life, but it has its obvious dangers. Some idea of a big sheep run may be found from the following figures. Sixty thousand sheep and a few hundred head of cattle, with plenty of horses, can be maintained on a tract of eleven hundred square miles. Of course we hear of difficulties with the "free selectors," who pick out any bit they fancy on the big run, steal the rich man's stock, compel him to buy them out, and behave very much as Irish tenants would do in similar circumstances. A couple of shepherds can look after eighteen hundred or two thousand sheep. They live in a hut with no neighbours nearer than ten or fifteen miles. Food is sent out to them once a week, and once a year they bring in their flocks to be washed and shorn, after which operation they receive their wages, and speedily consume them in drinking some horrible liquor at the first public-house on their road. There is an excellent description of the process of washing and shearing the sheep. The washers are hired for the time, and are known by the expressive appellation of "Knock-about men." They earn five shillings a day and their food. The shearers, as a rule, are of a higher class; some are young settlers anxious for a job. The sheep are dipped, rubbed, squeezed, and shorn, and the wool is then pressed and packed ready for exportation. Washers and shearers have their meals prepared by a cook who must be a man of strong build and resolution, capable at a crisis of quelling any unreasonable discontent at the quality of the tea, the damper or dough, and the boiled beef that make up the staple of Australian fare.

Equally characteristic is the capturing of stray cattle. The "scrubbers" or their descendants are bad neighbours to the tame herds. They induce desertion and often appear to belong to nobody. But they may occasionally command a price in the market, and, at any rate, their capture is desirable or imperative. As they persist in hiding in the scrub except at night, it is no easy matter to circumvent them. But with riders and horses thoroughly trained to their work, the wild herd is intercepted, and driven into the midst of a lot of "couchers" or domestic cattle, after which they seem to lose all spirit and submit to their fate. The "scrubbers" are also termed "clean skins" to distinguish them from the branded and tame animal; and the chapter on impressing, pounding, classifying, and marking the herds is one of the best in the book. Horses, like bullocks, take to the jungles occasionally, and we have an incidental notice of a certain yellow stallion that escaped, was recaptured, and got away again owing to the over-confidence of a stockman. This fine animal, like his prototype in Virgil, in *pastus armentaque tendit equarum*, and was afterwards seen by a forlorn shepherd "attended by a harem of mares as wild and untamable as himself."

The heat and dryness of Queensland are mitigated by something like a rainy season. John West, when sent to count the sheep in a distant station, gets lost in a swamp, spends the night shivering under a tree, and would never have been heard of again but for a friendly black, who catches and cooks an opossum, not to be despised when neither beef nor damper are available. A start for a new country, six hundred miles away in the interior, gives an opportunity for the display of many practical hints about driving herds. The march does not average more than nine miles a day. The cattle, accustomed on the old runs to feed at night, must now learn to feed on dry forage by day and to sleep during the darkness. Very often they are seized by unaccountable panics, and make a rush into space or back to their original run. Fires must then be kept up all night, and the horsemen have to watch in turns to corral and confine the herd within the ring of fire. This sort of thing lasts for days; pasture is deficient, water scarce; the explorers live on salted beef and damper, washed down with "pannikins of stanning tea." To add to their troubles, they are drenched by thunderstorms, and some of the cows provokingly calve. It is said to be told that the young calves have to be killed, as they cannot keep up with their mothers. Here an ingenious artifice is tried. The cows will not follow their companions, but go back to their dead offspring. To obviate this, the calf is skinned and stuffed, and each mother recognizes its particular hide, which is strapped on the saddle of some stockman during the day and put under a tree at night. This is a less painful incident than the attack by an aboriginal tribe on an outlying log hut during the absence of the master. The shepherds are slaughtered, and the young wife saves herself by barricading her house and using a revolver. The offending party is pursued by mounted police, composed of half-civilized blacks, who seem to take a positive delight in slaughtering their own countrymen. We are glad to learn that the retribution was not excessive, and that there is no ferocious joy over a hecatomb of creatures armed with boomerangs and spears against the unerring rifles of the escort.

A work of this kind would have been incomplete without some picture of the diggings. John West and a companion, as we have said, are lucky enough to find an "auriferous deposit" in a creek,

and this is afterwards doubled by heaps of quartz discovered under the nest of a bower-bird. Here they pursue their lucrative toil for some weeks, until they are disturbed by natives and by the intrusion of the murderer Oane, who is not equal to a personal encounter in the daylight with two determined and well-armed gold-seekers. But this is a very different scene from the settlement of a number of miners which has speedily assumed the proportions of a town. And here, of course, we have the huts hastily constructed of saplings and bark, with here and there a roof of zinc; the forges of blacksmiths and the butchers' shops, the general stores, the low taverns with high-sounding names, the profusion of articles that find the readiest sale, from blankets and shovels to potted meats and pickles, the drunkenness and the oaths, the industrious Chinaman, the fraudulent innkeeper, and the various specimens of the mining population racked with fever, soured by disappointment, surfeited with success. The lesson intended is that this venture is one where the prizes are few and the blanks are many. But this whole picture of colonial life may be read without skipping, and we are mistaken if it will not repay perusal much more than nine-tenths of the novels and stories poured out by a mob of authors who delude themselves into the belief that they are able to amuse and instruct society.

#### COLLEGE PLATE.\*

MR. CRIPPS has done good service to his country by his books on old silver. We see already signs of that improvement which he has so urgently and persistently advocated. True, the alleged grievances of the silversmiths have hardly been alleviated, but we no longer hear them put forward as excuses for poor designs and bad workmanship. The improvement is partly due to the progress of public taste, which will no longer tolerate the abominations of Bond Street in racing cups and rowing prizes. And this improvement in public taste is more owing to the efforts of Mr. Cripps than might at first sight have been imagined. His first work, published in 1878, was speedily made use of by compilers at second hand, and formed the basis of a large number of books on silver plate, marks, monograms, and patterns. Thus some knowledge of the subject was disseminated among buyers, and the manufacturer soon found that "cups" must, in order to please the public, have some merit beyond that of merely weighing so much. For many years the date marks had been literally a dead letter to all but an initiated minority. Mr. Cripps made them public property; and people who had pieces of old silver-work began to inquire into their history, and to set a value on them for their age. Mr. Cripps's book which contained the French marks was not so popularly written as his previous work, but it became even more of a prey to the compilers, with, of course, a similar result; and we have before us in the present volume a new proof of the general interest in the whole subject. The South Kensington authorities have laid in a stock of "reproductions" from celebrated English collections, and have engaged the services of Mr. Cripps to expound them. They have employed Messrs. Elkington to make casts of the most remarkable examples belonging to the various Colleges and Corporations of England and Ireland, and are thus "enabled to offer, for the instruction of the public, a remarkable series of facsimiles of the best remaining works of the gold and silversmiths of this country." The little book—it only extends to 155 pages—is full of very satisfactory illustrations, and will give great assistance, not only to the collector, but also to the designer and manufacturer; and it may, we trust, have a considerable influence on the silver-work of the immediate future.

Although the Goldsmiths' Company was incorporated by letters patent from Edward III. in 1327, there are but nine pieces of hall-marked plate known of an earlier date than 1500. The Wars of the Roses seem to have brought about the destruction of all earlier treasures made of silver and gold. The fifteenth-century devastations in England appear in some respects to have been as great as those of the sixteenth; but it is possible that the seventeenth wrought more harm to gold and silver work than either. The Regalia, for instance, must have contained many pieces of the highest antiquity before the time of Charles I. When the college plate was melted down or coined into money in the great Civil war, the oldest and most "gothique" pieces were probably selected for destruction first. College authorities have always been remarkable for their hatred of ancient art, and it is only in our own day that they have destroyed the oldest buildings at Cambridge. Mr. Cripps overstates his case, therefore, when he accounts for the rarity of fourteenth-century plate by the Wars of the Roses. There was probably little produced during those troublous times, though building went on prosperously, and some of the finest works of architecture in the kingdom were designed and carried out by Richard II. and Henry VI. It is incredible that vessels of gold and silver were not provided for the banquets of Westminster Hall, or the services of Eton or King's College Chapels. There are in all some fifteen or twenty pieces of plate of the fourteenth and fifteenth centuries preserved among the Colleges of Oxford and Cambridge and the civic guilds of London, "only two of them, and those about the least ancient, being marked in any way." Of the country corporations, one, that

of King's Lynn, in Norfolk, possesses what Mr. Cripps calls "the most ancient and most beautiful" of such treasures. It is an enamelled cup, said by tradition to have been presented by King John, but really dating about 1350. Whatever doubt there might be about the chasing of the silver is set at rest by the enamel, and Mr. Cripps finds in this cup another proof of the excellence of that branch of art in England in the fourteenth century. It has been usual to attribute many of the best examples to France; but even though the tomb of William de Valence at Westminster may be from Limoges, it is almost certain that equally good work was done as far back as the end of the thirteenth century in England. The Wassail Horn at Queen's College, Oxford, of which Mr. Cripps gives a beautiful cut, is partly of the time of Robert of Eglesfield, the founder in 1340, though the top, decorated with an eagle, is later. At New College the crosier or pastoral staff of William of Wykeham is still preserved, and dates from before 1404, when he died. Very little later is the "standing salt," borne on the head of a huntsman "or wild man," of silver gilt, which was, no doubt, part of the plate given to All Souls by Archbishop Chichele, who founded the college in 1437, and died in 1443. At the same college is a "mazer or bowl of maple wood, with a deep rim of silver gilt," which is probably part of the same bequest, and is undoubtedly English. A mazer at York Minster is of the early part of the fifteenth century, and others are at the Ironmongers' Hall in London, and at Pembroke College, Cambridge, the last-named being mounted on a silver foot of slightly later date. The Ironmongers' bowl is the earliest piece of plate among the treasures of the London Companies. The most ancient maces are probably those discovered in the tomb of James Kennedy, Bishop of St. Andrews, in the church of St. Salvator's College, which he had founded in 1456. One is supposed to be the original from which the others were made. It bears a Latin inscription in Gothic letters, recording its manufacture in Paris for Kennedy in 1461. Mr. Cripps describes a number of cups of cocoa-nut, some of which are preserved at New College, and some of ostrich eggs, but these, being more easily broken than cocoa-nut, are comparatively rare. The ostrich egg was supposed to be the eye of a griffin, and many examples are so enumerated in inventories. The Leigh cup, presented to the Mercers' Company about the end of the century, is the last example dating before 1500 which Mr. Cripps describes. It is still preserved in the hall of "the mystery" in Cheapside. It is of very elaborate workmanship, being sixteen inches high, and bearing evident traces of the Renaissance style, which soon after changed the fashion of all such objects—chalices and mazer bowls only excepted. They continued to be made in the old forms till a much later period. "In England Gothic ornamentation exclusively prevails up to the year 1500; and the line of demarcation is almost as marked as when one turning over the page opens unexpectedly upon a fresh chapter." In searching among the remains of English work of this period we do not find any pieces of the transition. This book contains two illustrations representing chalices—one belonging to Corpus Christi College, Oxford, dated 1507, and one to Trinity College, dated 1527, and both purely Gothic in form and decoration; but from the accession of Queen Elizabeth down to 1580, churchwardens' accounts are full of details of the exchange of such old-fashioned cups for new vessels of the shape required for the use of the laity. At visitations it was strictly asked whether the chalices had been melted up, and "decent communion cups" provided in their place.

The increasing wealth and luxury of the sixteenth century "told with especial effect upon the art and craft of the goldsmith." Five or six hundred, or even a thousand, pounds was the ordinary value, we are told, of the cupboard of plate to be found in the house of a knight or gentleman, or a wealthy merchant, about 1586. The guilds of goldsmiths were in full force, and the Assayer at Goldsmiths' Hall was constantly busy, and constantly, too, if we may believe contemporary accounts, was cordially hated for his zeal in condemning fraudulent work. In 1597 two London goldsmiths stood in the pillory at Westminster and at Cheapside, and lost their ears for offences of this kind. At Christ's College, Cambridge, are some of the earliest and most beautiful examples of the new style. One of these is described as a beaker, with cover, nine and a half inches high, of silver gilt, on a projecting base in the form of a Tudor rose, ornamented in *repoussé*, the top composed of six portcullises, with a finial formed of four Marguerites and a Tudor rose. Very beautiful also is the "Poison Cup" at Clare College, Cambridge. It belongs to the year 1570, or thereabouts, and is of glass covered with a network of filigree, set in bands of solid silver, and raised on three feet formed of cherubs' heads. The handle and cover, of silver, are beautifully chased. The cover is flat, set with a large pointed crystal.

The bulk of the book is, of course, taken up with much later and more ordinary works than these. The Ashmolean tankard dates from 1570, but looks as if it had been made in the eighteenth century, so strictly classical is it in design. The Founder's Cup at Emmanuel College, Cambridge, is usually attributed to Cellini; but, as Mr. Cripps remarks, it has been in England "from time immemorial," and looks "perhaps too late in style for the great master, who died in 1571." It is a model worthy of imitation, to judge by the very careful, but perhaps too small, illustration. The forms and workmanship exhibited by these examples continued in fashion through the succeeding centuries, and almost to our own time, and are found in countless cups, salt-cellars, tankards, and other vessels, the best specimens of which are enumerated and often figured by Mr. Cripps. Most of the family plate in use at the present day was made between the accession

\* *College and Corporation Plate.* By Wilfred Joseph Cripps, M.A., F.S.A. London: Chapman & Hall, for Science and Art Department. 288s.

of George III. and the end of the century, and "older plate is very scarce and rare, as the collector finds to his cost." Great punch-bowls seem to have been especially popular with colleges and corporations "in the reign of the late Queen Anna." Immense fountains for wine also occur of this period, such as those made for the great Duke of Marlborough, Lord Chesterfield, and others. One of Mr. Cripps's last illustrations shows the decay of art which set in a little later. It is a ewer, made for the Goldsmiths' Company in 1741, and to an eye educated by the lovely work of Elizabeth's time is simply hideous. Here is the description:—

On the lower part of the vase, a winged mermaid with two tails, accompanied by two boy tritons blowing conch shells. The foot is decorated with marine flowers, shells and reptiles; the upper part of the vase with festoons of flowers and the badges of the Company—namely, leopards' heads. The handle is a very bold half-length of a sea god, terminating in foliage.

Except that the mechanical part of the work is excellent, this ewer might have been made in Bond Street in the reign of Queen Victoria.

#### GALLOWAY'S SCIENTIFIC EDUCATION.\*

THIS book is an addition of not immaterial weight to the voices of protest already lifted up in considerable strength against the system of cram and shallow paper-work that has within the last twenty years been spread abroad in this country under the name of education. Mr. Galloway combines the qualifications of a man who has read and thought seriously about the principles of education in general with those of a specialist who can bear witness from his own knowledge to the effect of right and wrong methods of teaching in his own subject. The plan of the book, and the relation of the general to the special part, are thus explained by himself in the preface:—

In discussing scientific and technical education the author felt it impossible to avoid referring to the oldest branches of higher education, classics and mathematics. This was rendered necessary for two reasons; the first being that they are the subjects which have been longest taught in secondary schools and Universities. The Author conceived that, if he could show and prove that eminent authorities on these subjects considered that the modes of teaching them admitted of improvement, which he thinks he has done, it might very fairly be supposed that the teaching of the comparatively newer branches of learning, as those of the Inductive Sciences, might not be perfect. He has also shown, he thinks, from the opinions of the eminent authorities he has quoted, that some of the Inductive Sciences are very imperfectly taught; but he has had to depend upon his own opinion alone for the imperfect way he believes Chemistry is taught.

It will be observed that Mr. Galloway puts his own experience in a rather subordinate place, whereas it is to our mind the really important part of the book. His position, stated in the simplest terms, is this:—"My Lords of the Council, and other persons having authority in the training of youth in these kingdoms, I am credibly informed that your paper examinations and payment by results have more or less failed to give satisfaction all round; and I can tell you as a chemist, speaking from what I myself have seen and know, that they are a failure in chemistry." Manifestly that which Mr. Galloway testifies of his immediate knowledge must and ought to interest us more than what he has read in the treatises and essays of Dr. Whewell, or Sir John Herschel, or Mr. Herbert Spencer, or Mr. Latham, or Mr. Mark Pattison, or Mr. Todhunter. If he had possessed as much literary culture and tact as he does good sense and scientific competence, he would not have overloaded the earlier part of his work with a collection of extracts from almost every recent authority on education and examinations, not particularly well selected or arranged. A hasty reader, judging the book from these chapters, might be tempted to think it a mere compilation, which it is very far from being. Mr. Galloway is not a finished or artistic writer; but when he is speaking of what he knows at first hand he can express himself with clearness and point quite sufficient for his purpose. We cannot help regretting that he has not given more of his space to this, and less to the repetition of topics already familiar to everybody interested in education, and which he is not specially qualified to set forth. People who want to learn the elements of logic and psychology (to which a whole chapter is devoted) will scarcely choose to learn them here. On the other hand, Mr. Galloway's evidence as to what is the state of instruction in his own branch of science, and what it might be, has a peculiar and personal value. And when we say that he tells us what might be, we are understating the nature of his evidence. It is not matter of opinion merely, for he tells what he himself has actually done by a rational method of teaching, sometimes under circumstances that were sufficiently discouraging to begin with. In Dublin, starting from almost nothing, he has turned out students capable, not merely of repeating accounts of other people's work, but of doing original and useful work of their own.

In all these discussions about teaching and examinations there are two distinct branches of the question which are apt to be confounded. We have to consider whether competitive examinations are in themselves the best means, or good means, of promoting education. Then we have to consider, assuming that competition

is to be the rule, how examinations may be made as efficient as the nature of the process admits, and how the process is to be adapted to the different kinds of knowledge. And this is the point to which attention most needs to be directed just now. It may or may not be a good thing to hold severely competitive examinations in mathematics or scholarship. Mr. Galloway appears to side with many distinguished persons who find more harm than good in the practice, and we are not much disposed to quarrel with him on that score. But we need not go so far in order to be with him on the immediate and practical question. It cannot be a reasonable thing to conduct an examination in zoology or chemistry in precisely the same way as an examination in mathematics, and here agitation against a barren routine has a fair chance of being successful, though competition, as a general principle, seems for the present to be firmly established. The truth is that in the older subjects the art of examination has been carried by successive generations of examiners to a higher degree of perfection than has been, or perhaps can be, attained in any of the newer ones. In mathematics and scholarship, as Mr. Galloway truly says, pen and ink are for the most advanced specialist, as well as for the student, the tools of his trade. He is a worker in abstract reasoning and symbols, or in literature and language. Thus it is practicable to make students do on paper, in answer to printed questions, work of the same kind that advanced mathematicians and scholars actually do in original research or criticism; and the conditions, though they must be different from those of original work, are not too dissimilar for the examination to be a real test of power. For the same reasons there is no serious difficulty in excluding cram, in its grosser forms at all events. A University examiner in mathematics or classics who allowed himself to be imposed upon by the sort of thing which not only passes muster but may command prizes in London science examinations (as Mr. Galloway bears witness in one or two curious anecdotes) would simply not know his business. The art of solving mathematical problems may be and is cultivated, but no one can learn it without acquiring real command of the instruments and methods of mathematical reasoning. The art of translating Greek and Latin into English, and English into Greek and Latin, may be and is cultivated; but no one can turn a difficult passage of Greek or Latin into correct and idiomatic English, or produce a respectable Greek or Latin version of a passage from a good English author, without having acquired a real and well-grounded knowledge of the mechanism and structure of the languages. There have been, and there are, persons with a genius for teaching the subjects of classical examinations, like the late Mr. Shilleto, or with a genius for teaching those of mathematical examinations, like Mr. Routh. But such persons must be in the first rank of scholarship and mathematics, and their pupils must be seriously minded to learn. Their teaching is not cramming; its contents and character are determined by the prescribed scheme of the examinations, and exaggerated stress may be laid on this or that detail because it is important for examination purposes, but in the main the instruction given by them is genuine and thorough. Were it not so, it would have no chance. We say nothing here of the intrinsic value of the subjects examined in, and the relative weight that should be given to them; for our part, we believe that the Cambridge course has been vastly improved by the changes of the last few years; but that is not the matter in hand. Even under the old system a good place in the honour lists was an effectual warranty of real grasp and competence in the subjects which the examination professed to test. It is worth noting, however, that the University of Oxford has never relied on paper work alone. Oral examination always has been, and still is, a material part of the procedure of the Oxford schools.

If, then, the Cambridge system was to be extended to the natural sciences, the properly analogous method would have been to require the candidates to show themselves competent in the kind of work that is required of experts in the particular science. As the mathematical student is called on to solve a new problem, and the classical student to interpret a difficult passage, the learner in anatomy should be called on to demonstrate and dissect, the learner in chemistry to analyse and assay. But it is always the easier way, more especially when one is in haste to make a show of results, to copy the details and routine of a system without considering what are the reasons for them in its own circumstances, and whether they apply to the circumstances in which it is to be copied. Accordingly the system of paper work and adding up marks has been applied wholesale to all manner of subjects to which it is very ill adapted, until the climax of absurdity has been reached in the papers issued by the South Kensington Cookery School, which pretend, or a few years ago pretended, to discover the proficiency of young persons in the art of cookery by asking them to describe in writing how they would make an omelette. And so it has been in chemistry and the other sciences. Candidates are asked on paper how they would go to work to test the presence of a given poison in a substance put before them. Mr. Galloway points out that a man may have got up from text-books all about the tests for arsenic, so as to give in writing a fluent account of them which will command high marks, and yet may be perfectly helpless if he is set down in a laboratory to do the thing he has learnt to describe. The competitor in such an examination is under great temptation to neglect knowledge of the things themselves for a show of knowledge of the names of things, and it is to be feared that he often does. He loads himself with a "useless lumber," as Mr. Galloway names it, of facts learnt by rote, and imperfectly understood for want of converse with the facts

\* *Education, Scientific and Technical; or, how the Inductive Sciences are Taught and how they ought to be Taught.* By Robert Galloway, M.R.I.A., F.C.S., &c. London: Trübner & Co. 1881.

themselves. In short, our science teaching has put the cart before the horse. We ought to have adopted the best known methods of teaching, having regard to the nature of each subject, and arranged the system of examination accordingly. We have taken over bodily a system of examination devised for wholly different subjects, at the risk of starving all vitality out of the teaching to make it fit the examinations.

Even within the limits of what can be answered on paper there is great room for improvement. A common fault is to set questions requiring details which no expert thinks of carrying in his head in practice. Thus examinees, Mr. Galloway tells us, are asked to write down atomic weights of elements for which a working chemist would refer to a book. This is like expecting mathematical students to know the table of logarithms by heart, which, we need hardly say, is not the practice of mathematical examiners. It is possible, on the other hand, to imitate their practice by setting chemical questions in the nature of problems calling for a real exercise of thought. Mr. Galloway himself has introduced this with good effect. Again, chemistry cannot be taught by text-books alone; but the text-books may at least be composed on a rational plan. Some of them plunge into a detailed account of the properties of particular elements without giving any preliminary notion of the general properties of matter, of what an element is, or, in short, of the nature of the new field of knowledge the learner is supposed to be entering on. Mr. Galloway gives a specimen of this kind of thing at some length, and his criticism is no more than it deserves. Another of his aversions is the common type of popular science lectures. He finds that persons who have attended these are more troublesome as pupils than those who know nothing, and he regards it as a healthy sign of desire for real knowledge in the people of Manchester that so-called popular lectures are no longer in demand there. Finally, Mr. Galloway pleads strongly for the reconstitution of the Education Office as a substantive department of the Government independent of the Privy Council.

#### A MAN'S MISTAKE.\*

THERE are few men who have not many times in their life fretted over the weak decoction which over-careful hostesses are wont, with an apologetic air, to serve up under the name of tea. The pretence is always barefaced enough. Neither to the taste or smell, nor even to the eye, is it what it says it is. It is, as is known to every one, both to her who gives and to them who take, nothing but warm water slightly coloured and sweetened. It is fit for nothing but the slop-basin, and yet because it is called tea it has to be swallowed down as best it can. Perhaps a fairly good pot had been brewed at first, but the number of the guests had unexpectedly increased and their wants had been supplied solely from the kettle. In tea-making, by the way, this kind of meanness is still tolerated. A host would be scouted who replenished his half-empty beer jug or wine bottle with cold water, and then, giving it a shake and peeping into it, said that he feared the next glass would not be quite so strong as the last. But what he would never dare to do even secretly, his wife, with all the courage of her sex, will venture on with the most barefaced coolness. Perhaps, however—for this also does happen—the number of the guests had been known from the first, but the allowance of spoonfuls had been intentionally kept too low. A little tea had been served out to a big teapot, and a large measure of hot water. The virtue of prudence had been displayed, economy had been exercised, weak nerves had been considered, and the tea—what little there was—had been spoilt. In what way the novel before us—*A Man's Mistake*, as it is called—has been treated we do not know. It reminds us, however, of tea made either in one way or the other. It is, indeed, as weak and flavourless a decoction as we have been called upon to swallow for many a long day. The author, perhaps, began by writing her story in one volume, and then, to satisfy the requirements of her publisher or the circulating libraries, poured in enough harmless twaddle to swell it out to the proportions of three. Perhaps, on the other hand—for her experience as a novelist is by no means small—from the first she meant to make three volumes, but was either unwilling or unable to afford more material than would barely suffice for one. Be the explanation what it may, she has certainly produced a decoction that we have found almost impossible to gulp down. As we tried to swallow it, we were reminded of the miserable criminals who used to be made on the scaffold to take down a bucket or two of cold water by way of torture. Our lot, in one way, was harder than theirs, for by them stood the executioner, who would quickly free them from any chance of a repetition of the enormous dose; while we know only too well that, if our life is prolonged, many a bucketful still awaits us. We should have thought it impossible that such a story as the one before us could find a single reader, did we not call to mind the kind of conversation that goes on day after day in parlours and other places where ladies most do congregate. Men can no doubt in their way be quite as dull as women, but no man could get through even the opening chapters of this story, unless perchance it was some young curate who had been persuaded to read it aloud to a circle of the literary ladies of a village in the fen-country. Even he at last, driven to desperation, would, we are convinced, get a sore throat,

or an inward conviction that all novel-reading was sinful, long before he had reached the end of the book. We despair, indeed, of making our readers understand how tedious this novel is. No sample will show its dullness, any more than a sample could show the dreariness of a wide marsh or a dried-up desert. It must be gone through before it can be really known how vast and how uniform is its stupidity. Yet, for all that, it will have its readers, for, as we learn by the title-page, its author has already brought out so many stories that, while four are mentioned by name, it takes a double &c. to include the rest.

We were almost overwhelmed by the first chapter. In only twelve pages we had given us twenty-one names of the inhabitants of the village in which the man lived who made the mistake, while in the next twenty pages nine or ten more were added. We presently find out that some of these are merely names, for the bearers of them take no part in the story. Nevertheless we could not tell, as we came upon them, which were of importance, and therefore had to be remembered, and which might be safely forgotten. Our memory was needlessly fatigued, and our energies relaxed almost before the flood of twaddle burst upon us in all its fury. It was too much for us, and at first we sank beneath it. When at last we rose to the surface, we were just able to make out that, after all, there really was something besides words, and that there was a plot. It is hard to know who is the hero of the story—Mr. Aubury, who makes the mistake and gives the book its name, or Mr. Moriston, who marries the heroine. She, too, by the way, makes a very great mistake, and nearly marries the wrong man, who also makes a mistake. Her lover, moreover, makes quite as great a mistake as any one else, and so does a lady who loved Mr. Aubury and with whom he was in love. In fact, almost every one makes mistakes, which are only set right by a malarious fever which kills off one woman, and an able doctor who cures another just at the right time. Every one marries in the end who deserves to marry, and so no one is much the worse for all these mistakes but the unhappy reader. For, if they had not been made, it is pretty clear that the book would not have been written; for even our author must, we presume, have something to set her pen going. Mr. Aubury, whether the hero or not, at all events lived in a castle which had been attacked by "the Warwicks and Plantagenets" and battered by Cromwell's cannon in King Charles's time. He was a somewhat melancholy bachelor of middle age, to whom so much of a mystery attached as can be found in the fact that he had never married. To the reader this mystery is before long cleared up, for we learn that he had been secretly engaged to Miss Alvina Olerehart. She, after her engagement, had met with an accident and had become crippled. Though she had been confined to her couch for many years, yet the reader pricks up his ears when he hears that the village doctor said that it was quite possible that after all she could be cured. That, of course, means that, whatever mistake Mr. Aubury may make in the way of marrying, the faithful lady of the strange name will become his wife in the end. A mysterious widow, Mrs. Maria Plummeraleigh by name, happened to visit the doctor's wife. Though her figure was good, it had, we are told, a scarcity of tissue about it. Nevertheless, in spite of her mystery and this distressing scarcity of tissue, every one said that she was just the wife that Mr. Aubury ought to have. No one was more eager for this match than her friend Mrs. Polemont, in whose house she was staying. Many a conversation did these two ladies have over Mr. Aubury, and the style of dress which was most likely to win his eye. One specimen of their talk will perhaps satisfy our readers. Should, however, they find it to their taste, there is, we can assure them, plenty of it to be had:—

"Maria," she said, changing the conversation, "I am so glad I insisted upon your having the navy-blue bonnet. Of all things that put me out of temper, a brown bonnet and a black silk dress do it most effectually. Just come to the glass now and see what a difference I have made in you."

Maria came, little Mrs. Polemont prancing round about her, and giving the bonnet a tilt, now up, now down to see in which position it suited its wearer best.

"Well on your forehead, Maria, is the place for it, because it takes off from the length of your face. And now that people wear their hair down over their eyes so, one looks unfurnished with such a great place seen at the top. You wouldn't like to take to a fringe, would you, Maria? Or else it would become you very well, because of such a quantity of forehead."

Mrs. Plummeraleigh said she was afraid the fringe would be out of place.

"Well, yes, perhaps it would."

Mr. Aubury would have been proof against the navy-blue bonnet, had it not been for two mistakes into which he fell. In the first place, he and his Alvina managed to misunderstand each other. Each thought that the other was tired of the kind of engagement that still existed between them. This however, by itself would never have made him marry Mrs. Plummeraleigh. He had been told that he must engage a lady-companion for his half-sister Linnet, who was a wild young lady of seventeen or eighteen. Linnet and Alvina, by the way, are a queer pair of names for the two heroines of one novel. For all that we can see, Betty and Molly would have done equally well. So awkward was Mr. Aubury in asking the widow with the scarcity of tissue about her to fill this place that he managed to make her think that he was offering her his hand. He did not like to draw back, and so the mistake was made and they were married. He and his Alvina came, however, to an understanding. He told her what a blunder he had made, while "almost a glory"—whatever that may be—"flashed into her eyes for just one moment, and then died away." For the new Mrs. Aubury's life, though she was a young woman,

\* *A Man's Mistake*. By the Author of "St. Olave's," "Janita's Cross," "Annette," "Little Miss Primrose," &c. &c. 3 vols. London: Hurst & Blackett. 1881.

and, barring the tissue, in good health, the reader hereupon would not give a brass farthing. She is as certain to die as Alvisia is to recover. As there was a mystery about her, she might be proved to have a former husband still living, but for certain reasons this did not seem likely. Linnet meanwhile had fallen in love with a young Scotchman, as poor as he was heroic. He is made to believe that she has engaged herself to a wealthy lover, while she thinks that he has treated her with scorn. As an easy way out of the difficulty, she at once accepts the offer of a rich but middle-aged and most unheroic wooer; and then, as might be expected, begins to look wretchedly ill and to lose her complexion. Nevertheless, the bridemaids are appointed, the wedding dress ordered, and the day fixed. These things are all very good in themselves; but for poor Linnet there was no longer "any shining of Heaven's blue through thinning boughs, on which the golden glory of autumn lingered, any glamour of mystery, or hope, or wonder, in the way she had chosen for herself." Her situation seemed indeed desperate, and so did the young Scotch hero's. Our only hope was that the middle-aged lover would have a fit, or be pitched off his horse into a stone quarry. His life is spared, however, and yet the engagement is broken off. We must leave something to arouse the curiosity of our readers, and so we will not tell them how this happy result was brought about. The Auburys spend the winter in the North of Italy. The husband discovers his wife's secret, and learns that she had been guilty of the enormity of having once been a lady's-maid. There is nothing, therefore, left for her but to die penitent. This she quickly does by the help of "a malaria fever of a dangerous type." Alvisia soon after recovers from the accident which had so long crippled her, and marries her old lover, while Linnet is reconciled to her poor Scotchman. Even the rich middle-aged lover is provided with a wife, and every one is left happy except the reader, who is so broken in spirit long before he reaches the end that he has not any heart left to rejoice at the deliverance which has at length come upon him.

#### GERMAN LITERATURE.

**A** CALENDAR by Dr. Ditttrich of the letters and official documents emanating from, or addressed to, Cardinal Gasparo Contarini (1) is rather a work of reference than one for perusal, but may become the groundwork of one of the most important contributions to modern historical literature. Dr. Ditttrich appears to intend writing the life of Contarini, which will be nearly equivalent to the history of the most interesting phase of the Roman counter-Reformation. Luther, in homely but accurate phrase, had brought the Church of Rome to its senses. All men of insight agreed in the necessity of a reformation so far as discipline was concerned. But one party, represented by Loyola and Caraffa, wished to go no further, and to make up for the tacit admission that discipline needed amendment by the sternest severity towards dissentients in doctrine; while another, represented by Contarini, Pole, and Cervini, inclined, perhaps unconsciously, in the direction of Protestantism. Between the two stood the mass of conservative sentiment impersonated in Pope Paul III. himself, a fine gentleman of the old school, who in his heart would fain have perpetuated the traditions of his immediate predecessors, but had the wisdom to discern that this was not possible, and only hesitated between Caraffa and Contarini. The latter was removed by death in 1542, not without suspicions of poison; but the party of conciliation was still strong enough to place the moderate and humane Cervini in the Papal chair as late as 1555, and bigotry only triumphed with his successor, Caraffa. Even the comparatively dry bones of a calendar give a highly favourable impression of Contarini as a man of the purest motives and most amiable disposition, as well as of the most remarkable range of accomplishments. He appears as a classical and Biblical scholar, statesman, administrator, diplomatist; astronomers send him their unpublished works to correct; and he displays acquaintance with the most abstruse intricacies of scholastic logic. By far the larger share of the collection is devoted to the papers connected with his legation to Germany, shortly before his death, which are most valuable for the history of the Reformation in that country. There is, however, perhaps more personal interest in those of a somewhat earlier date, which include more correspondence on private matters characteristic of the writer and his friends, among whom Pole, Cervini, Sadoleto, and Bembo are particularly to be named. Apart from the religious controversies of the time, the tone of their correspondence is quite classical, reminding us of the circles of Cicero or Pliny. Other letters to or from less distinguished persons frequently give a curious insight into the manners and circumstances of the time. Among Contarini's most important correspondents on political business are Morone and Cardinal Farnese. The earliest letters of all relate chiefly to the affairs of the Venetian Republic, for, before his elevation to the Cardinalate in 1535, he was a Venetian senator. The calendar is followed by an appendix of documents of which the full text is given, almost all of great interest. Among the most curious is a report presented by Contarini to Pope Paul III., exhorting his Holiness to relinquish the lucrative extortions of the Roman datariate. Contarini says roundly that the Popes since Paul II. have all disgraced themselves, and adds, *Magnum certe negotium et infinitum, si quis voluerit*

*omnia gesta omnium Pontificum tuari*. Dr. Ditttrich's diligence as a compiler and lucidity as an abbreviator are equally admirable, and it is much to be wished that he may be enabled to fulfil his design of writing the complete biography of his interesting hero.

The life of another remarkable personage of the Reformation era has been ably written by Herr Hermann Dalton (2). Johannes a Lasco, or Laski, is peculiarly interesting to Englishmen from the influence he exerted in the cause of the English Reformation under Edward VI. His counsels are stated by contemporaries to have had much weight with the wavering Cranmer, and to have contributed to the evolution of that Calvinistic element in the Church of England, whose co-existence in her, side by side with antagonistic schools of thought, gives her a character of universality unknown to less comprehensive Churches. Lasco had come to England as a fugitive. The nephew of the Polish Primate, he had surrendered the most tempting ecclesiastical prospects from fidelity to conviction; and, after an eventful career in Friesland, found a refuge in England, where he enjoyed the friendship of all the leaders of the Reformation, and became superintendent of all foreign Protestant congregations. The accession of Mary drove him back to the Continent, and he eventually found his way to his own country, just then the most tolerant in Europe, where his talents and station procured him the undisputed leadership of the Protestant movement until his death. Had the Reformation triumphed in Poland, his name might have been hardly less celebrated than Melancthon's; but the disastrous victory of the Jesuits almost blotted it out until the republication of his works by Dr. Kuyper a few years ago. Herr Dalton, partly under Dr. Kuyper's guidance, has produced a valuable monograph, of which students of the English, no less than the Polish, Reformation will do well to take note.

Fritz Hommel's lecture on the Semitic race (3) may be designed as an indirect protest against the scandalous anti-Jewish agitation in Germany. He has formed a very high estimate of the capacity of the race, even in the fine arts and other departments where they have seldom or never attained supreme excellence, and he protests against Mahomedan polygamy and general depreciation of woman being regarded as inherent faults in the Arabic character. He also contends for the original monotheism of the Semites, maintaining that the polytheism which undoubtedly prevailed among them from an early date was borrowed from the Accadians. There is a useful summary of the peculiarities of Semitic grammar, and a map showing the diffusion of the various Semitic peoples and languages at various periods of history.

An especially Semitic topic is discussed by Dr. F. Delitzsch in his disquisition on the site of Eden (4) as illustrated by Assyrian documents. He rejects the theories which locate Paradise in India, Ethiopia, Armenia, or any country remote from that where the tradition originated, and identifies it simply with the neighbourhood of Babylon; the Pison and Gihon being in his view merely branches of the Euphrates. The resemblance of the story of the Fall to the Babylonian myth of the serpent Tiamat, and other similar analogies, are urged in further support of this theory. About half the volume is occupied by a series of elaborate excursions on Assyrian geography.

Professor Volkmar's "Jesus of Nazareth" (5) is designed as an exhibition of the life and teachings of Christ from the genuine Christian literature of the first century. Unfortunately the Professor's standard of authenticity is so exacting that he hardly leaves himself any materials for his edifice. He allows none of the Biblical writings to belong to the first century except the Gospel of Mark, the Apocalypse, and the greater epistles of St. Paul. There is abundance of acuteness and earnestness in his book, but, considering how generally his conclusions are disputed, a less dogmatic tone would not have been unbecoming. The book will nevertheless be of great value and interest, particularly as the author's views as to the late date of some of the canonical writings, and the consequent claim of semi-apocryphal works like *Hermas* to be discussed on an equal footing with them, render his work more of a review of the general body of early Christian literature than a mere addition to the innumerable "Lives of Christ."

F. Nietzsche's thoughts on prejudices in morals (6) are less searching and also less eccentric than might have been expected from some of the writer's earlier performances. Their character is aphoristic, but they are in general very deficient in the pith and terseness which the aphoristic style requires. Their polemic against received ideas is less vigorous than might have been anticipated, and their profession of originality greater than their performance. At the same time there are many acute remarks, such as the observation that, since Continental princes have generally received a military education, parasites have forsaken Court circles, and must now be looked for at the tables of eminent financiers.

The first volume of Dr. Schultze's work on the philosophy of natural science (7) is mainly historical, and evinces little originality until he comes to deal with modern developments of philosophy. His observations are then sometimes very much to the point, as when, in commenting upon the close approach of Leibnitz to the doctrine of evolution, he remarks that Leibnitz contemplated, as a series of distinct steps, what science now regards as one perpetual transition. He may perhaps be briefly characterized as a Darwinian naturalist whose philosophical sympathies are with Kant rather than with Hume, and who deems that the theory of evolution need not lead either to absolute scepticism or to dogmatic materialism.

Ever and anon in the wilderness of contemporary literature we encounter a book so fresh, so natural, and so pleasing, that it seems to have been transplanted from some other sphere rather than to have sprung up where it is found. Such is actually the case with the charming letters and memoirs of General and Madame von Riedesel (8), for the matter is more than a century old, and the original publication more than eighty; but they are so little known to the present generation as to constitute practically a new book. General von Riedesel, a Hessian by birth, was at the outbreak of the American War of Independence an officer in the service of the Duke of Brunswick-Wolfenbüttel, Lessing's princely master—a weak extravagant prince who paid his debts, or some of them, by selling his subjects to fight the battles of the English in America. Riedesel was despatched on this service at the beginning of 1776; his wife, with three young children, speedily followed him—an heroic undertaking in those days. From the unwillingness of her female companion to cross the Atlantic, Mme. von Riedesel was detained several months in England, and her memoirs contain several curious traits of English life at the time. Arrived in America, she shared her husband's hardships, including several campaigns, the disastrous capitulation of Saratoga, and a long captivity, much of which was spent in travelling under circumstances of great difficulty. Every page is full of interest, particularly the description of the bombardment of Saratoga—where Mme. Riedesel and her children were the inmates of a cellar—and the incidents of imprisonment. The American officers appear to have behaved with remarkable generosity; and the intense exasperation of the common people against everything British was rather shown by rudeness than cruelty. The charm of the book, however, consists chiefly in the unconscious portrayal of a perfect feminine character in the relations of wife and mother. With no apparent consciousness that she is relating anything remarkable, Mme. von Riedesel portrays a succession of such trials and troubles as have fallen to the lot of few, borne with ease, and even pleasure, under the impulse of the same strong affection which had brought her to America. Her husband's frequent sicknesses and other grievances touch her far more nearly than her own; and her account of them, although by no means highly coloured, affects the reader with her own emotion. Nothing is more effective than her scrupulous avoidance of all exaggeration; with no exercise or affectation of literary methods, her artless narrative is a model of simple pathos. General von Riedesel's share in the book is nearly confined to a military memoir on the capitulation of Saratoga. He returned safely to Europe with his wife, and survived to be once again sold into foreign service, this time to the Dutch. He died in 1800; Madame von Riedesel in 1808.

Mr. Becker (9), it appears, has resided in the United States for seventeen years, and made himself thoroughly acquainted with the seamy side of American life and institutions. It is no great breach of charity to surmise that he has not himself succeeded as an emigrant, otherwise he would have had less time and less inducement to disparage his adopted country. A book mainly on so rich a subject as the eccentricities of American professional politicians and the fascilities of "rings" and "lobbyists" cannot fail to be amusing, and might have been useful to the nation concerned, but for the writer's evident malevolence. A long indictment, dwelling ruthlessly upon every real or imaginary shortcoming and ignoring the other side of the question, produces the effect of a long libel, especially when many of the complaints are out of date or entirely frivolous. Mr. Becker, for instance, seems to think a riot in Arkansas, the Mayo of America, a blot upon the whole Union; and is horrified at the haberdashers' stores in the Western cities being served by shopmen, although he admits that the same custom prevails in Vienna—and in London too, he might have added. The most curious point about his book is the occasion of its republication, which seems to be merely the gratification of a grudge of the editor, F. von Hellwald, against the German press in America. Herr von Hellwald, it seems, some years ago took occasion to remark in a German magazine that the American German press was, as a rule, very ignorant, very miserable, and very ungrammatical. The injured journalists responded by a torrent of abuse, thereby establishing the soundness of Herr von Hellwald's criticisms; but he, instead of feeling complimented by this confirmation of his

veracity, republishes Mr. Becker's book and accompanies it with a long prefatory invective, proving no more, we fear, than that he cannot understand a joke. Among the enormous crimes gravely enumerated as calculated to call down the wrath of Heaven on Transatlantic journalists, German and English, are that one of them allows his subscribers to pay in potatoes, and that another compares earthly happiness to the tail of a scaped pig.

Another German traveller (10) testifies, on the contrary, that it is a most unusual thing to find a German denizen of the United States speaking otherwise than with enthusiasm of the country. It is true, he adds, that the German who has not succeeded has commonly perished in the attempt. The author of this observation is a very instructive and entertaining writer, who has made the tour of the world to inquire how the various European nations are acquitting themselves of their mission as colonists. The larger part of his first volume, and the most interesting to English readers, is occupied by a description of his visit to New South Wales and Victoria. We are happy to find his account highly favourable, not merely as regards the material development of the colonies, but as to their social characteristics and the general standard of culture. The physical conditions of Australia will, he thinks, ultimately produce a type of inhabitant resembling the Sicilian or Southern Italian. Some of the traveller's descriptions of Australian scenery, especially of the great cataract in the Blue Mountains, are very striking.

Herr Leopold Katscher (11) has not personally visited China, and his "Sketches from Chinese Life" are consequently a compilation. Their materials are derived to a great extent from Archdeacon Gray's work, the best Herr Katscher could have used, and, being manipulated with his accustomed literary skill, the result is a very satisfactory volume.

The last number of the *Russian Review* (12) contains an article of great interest to English readers, one on the communication between Europe and India through the Tokko-Tartar district, by General Annenkow. General Annenkow considers that the connexion of Russia and India by a railway through the Tekke oasis, Herat, and Candahar, may have a most important influence upon the commercial relations of Europe and the East; and he seems to hint, though he does not expressly say so, that it would supply Russia with a strong motive for keeping the peace in Central Asia and Afghanistan.

We have received a letter from a friend of Colonel Olcott, objecting to some strictures which we lately made upon that gentleman and Madame Blavatsky as founders of the so-called Theosophic Society of India. Our remarks were based upon the published accounts of their doings, which struck us as bearing a suspicious resemblance to those of the "spirit mediums" in Europe and America. We are quite willing to accept our Correspondent's statement that Colonel Olcott occupied an honourable position in his own country, and to believe that both he and Madame Blavatsky are credulous enthusiasts, and not unscrupulous adventurers. When, however, people promulgate pernicious theories, and adopt practices which, under another name, have been authoritatively pronounced illegal and mischievous, they must not be surprised if, in the absence of private information as to their biography, they lay themselves open to adverse criticism.

## DEATH OF PRESIDENT GARFIELD.

THE death of the President of the UNITED STATES causes deep and universal regret, though the shock of the first surprise has passed away. The fatal result was not unexpected. No physician or surgeon can with certain success counteract the effects of a dangerous wound, or the inevitable risks of an apparent convalescence extended over several weeks. The sanguine expectations of his early recovery which were for some time constantly expressed, as if for the purpose of inspiring a confidence which every man wished to borrow from his neighbour, were, it is believed, not shared by competent judges in England. Non-professional opinions are worth nothing in cases of disease; but laymen of mature experience have learnt not to be sanguine in cases so serious as that of Mr. GARFIELD. The death of the PRESIDENT will revive the indignation which was caused by the outrage when it was perpetrated; and there is fortunately no reason to believe that the delay which has intervened will have the effect of saving the life of the assassin. It is satisfactory to know that GUILTEAU has not attracted to himself any portion of the morbid sympathy or interest which sometimes attends the worst of criminals. His act has not been attributed to any motive more romantic than the resentment of a disappointed place-hunter, combined with a vulgar desire for notoriety. It would be a cause for regret if he escaped the punishment which more than any other represents the general horror of atrocious crime. It is the duty of those who administer and execute justice to maintain, as far as possible, the wholesome instinct which rejects all palliations of murder. Within a few weeks, while Mr. GARFIELD was struggling between life and death, public feeling has been less disposed to tolerate threats of similar crimes to be perpetrated in England by Irish ruffians. It is a grave error to believe that Nihilists and Fenians can openly defy the fundamental principles of right and wrong without a demoralizing effect on the society which tolerates their profligate paradoxes. The wretched GUILTEAU might probably never have ventured on his crime if he had not been corrupted by such examples as that of HARTMANN and by the teaching of ROSSA and his accomplices. The doctrine and practice of the Irish Land League may perhaps have had a share in familiarizing a weak and vicious mind with the thought of murder. That body at its recent Convention passed a vote of sympathy with the late PRESIDENT; but the speakers took the opportunity of excusing the not less atrocious murder of the Emperor of RUSSIA. It must be admitted that the doctrines of the League are entirely consistent with its practice.

By a natural and creditable impulse, Americans of all parties have during the PRESIDENT'S illness become more and more cordial in their appreciation of his considerable merits; and a large share of popular sympathy has been extended to Mrs. GARFIELD, who seems to deserve all the praise which her devotion to her husband has earned. Mr. GARFIELD, like some of his predecessors in the Presidency, and in common with many other eminent Americans, earned his livelihood in early youth by manual labour, and contrived to educate himself. In accordance with the same precedents, he became a teacher in a school, a lawyer, an active local politician. He must have already made himself known when he joined the Federal army at the age of thirty, for his merits and his popularity obtained

for him the rank of General before the end of the war. It may be doubted whether any non-professional officer displayed so much military aptitude. Within a few years he rose to be a principal leader of the Republican party in the House of Representatives, and he seems to have acquired a high reputation as an election manager, without compromising his public or private reputation for honesty. Immediately before his nomination for the Presidency he had been elected Senator for Ohio, but he never took his seat. At the Republican Convention of last year he was charged with the conduct of Mr. SHERMAN'S interests; and he was consequently the most conspicuous opponent of General GRANT and of Mr. CONKLING. The usual distaste of Conventions to the selection of the most conspicuous candidate rendered it necessary to provide another nominee in the place of Mr. SHERMAN, and the section of delegates which was irreconcilably opposed to General GRANT chose the most respectable of Mr. SHERMAN'S supporters as his substitute. It is the best proof of Mr. GARFIELD'S integrity that during the contest which ensued he was not accused by the opposite party of political or personal misconduct. He seems, indeed, to have possessed both remarkable ability and an unusually pure moral character. Both the Republicans and the Democrats were well represented in the Presidential contest, for Mr. GARFIELD'S political experience might be fairly set off against General HANCOCK'S military services. Even Mr. CONKLING, notwithstanding his disappointment, was induced to canvass for the Republican nominee. The dispute which ensued as to the stipulated price of Mr. CONKLING'S services has, through circumstances, since become obsolete. The only act during Mr. GARFIELD'S short tenure of office which attracted general notice was his appointment for party reasons to the lucrative post of Collector in New York of a local opponent of Mr. CONKLING. The nomination had probably no important significance, but in the result the factitious excitement which subsequently arose may possibly have stimulated the criminal propensities of the assassin.

The universal sympathy and veneration which has been shown to the PRESIDENT during his prolonged sufferings does honour to the feelings of his countrymen. Much official and general inconvenience must have arisen from the suspension of the executive functions for between two and three months. There would have been no difficulty in devising means for temporarily applying the place of the PRESIDENT; and probably might have become necessary, if the illness had lasted much longer, to recognize his present successor as his deputy; but the Cabinet, with the full approval of the country, determined to do nothing which might possibly throw impediments in the way of the PRESIDENT'S recovery. It was known that he continued to take an active interest in public business, and an invalid might probably have been depressed by the knowledge that it had been thought necessary to provide for a long suspension of his official activity. In the same spirit in which the spectators remained silent at the stations which he passed between Washington and Long Branch, the entire nation acquiesced in the expediency of postponing every other interest to the consideration of the means by which his recovery might be best promoted. The genuine sympathy which was manifested in foreign countries, and especially in England—and to which, with characteristic good feeling, the QUEEN has given expression by ordering a Court mourning—appears to have received due recog-

dition from a people which was thoroughly in earnest. It fortunately happened that during the forced retirement of the PRESIDENT, no political question of importance either at home or abroad required immediate attention. The PRESIDENT had the satisfaction of knowing that the country was in full enjoyment of unprecedented prosperity, and that, even if Congress had been sitting, there was no urgent need of legislation. No other great community has the good fortune to be equally independent of Governments and of representative assemblies.

Mr. ARTHUR, who now succeeds as President, has during the late interval of suspense judiciously withdrawn himself as much as possible from public notice. He belongs to the section of the Republican party which was personally opposed to Mr. GARFIELD; but it is not certain that the internal dissensions which prevailed at Chicago implied any conflict of political opinion. Mr. ARTHUR has not attained the same rank as his predecessor, and he has been associated with the less respectable section of the Republican party. But Mr. ARTHUR was by a customary compromise appointed Vice-President on the nomination of Mr. CONKLING, and he had earned the distinction by local activity and reputation for personal integrity and capacity in an important post. Now that he is President, it will be his interest as well as his duty to defend the legitimate prerogatives of the office against Senators and election managers. While he was engaged in organizing caucuses and conventions he probably relied, like other active politicians, on the disposal of official appointments as the natural motive power of American party politics. As President he may not improbably look rather to the public interest, and he may endeavour to promote official efficiency by a reform of the Civil Service. A natural, if not a logical, result of the late disaster will be a disposition to support the President for the time being in the due discharge of his functions. Mr. ARTHUR will be unwise if he fails to profit by a reaction against the Senatorial usurpations which began in the Presidency of Mr. ANDREW JOHNSON. His first duty naturally was to define his position to the Cabinet which had been appointed by Mr. GARFIELD. It was expected that Mr. BLAINE would be relieved of his post as Secretary of State, but it does not yet appear that any alteration has been made in the Cabinet.

#### THE NEW RUSSIAN UKASE.

SOME of the fruits of the Dantzic meeting have not been long in making their appearance, and they entirely justify the anticipation that the results of that interview would prove in no respect unfavourable to Austria, and that it was directed, at least in great measure, to the concoction of fresh attempts to remedy the internal disorders of the two Empires. Whether the telegram attributed to Baron HAYMERLE, in reference to the behaviour of Mr. DE GIERs and Prince BISMARCK, be genuine or not, no suspicion seems to rest upon the very cordial despatch of the Czar to the Emperor of AUSTRIA, and this would, of itself, be sufficient proof of that no umbrage to that potentate was intended. Indeed a probable interview between the two sovereigns has since been announced. The new Ukase published at St. Petersburg on Wednesday, and approved by the Czar a week previously (that is to say, just after the Dantzic Conference), has produced a variance of opinion between the evening and the morning organs of Radicalism in London; the *Daily News* putting the natural and historically correct construction upon it, the *Pall Mall Gazette* taking its contemporary to task for ignorance of foreign politics, and for mistaking a mere codification of previous enactments for the proclamation of a new reign of terror. This is not the first time that the *Daily News* has not been Russophile enough to satisfy the ardent devotion of the *Pall Mall* to the liberators of Bulgaria and the conquerors of Central Asia. The morning journal was severely taken to task not long ago by the evening one for its maladroit remonstrances with the Czar on his flagrant breach of the undertaking given to, or at least intimated by, Sir CHARLES DILKE. There is no need to attempt arbitration in this dispute; and it might be sufficient to say that the St. Petersburg stockbrokers appear to have been as ignorant of politics as the *Daily News*, inasmuch as the Bourse is reported to have been depressed in consequence of the Ukase. It is, however, unnecessary to

repeat the arguments of this kind. As a matter of fact, the new Ukase, if it in some respects only repeats parts of the numerous edicts having reference to the government of the interior which have been issued since SOLOVIEV's attempt on the late Czar, repeats them in a combined form, extends their application in some cases, and gives them the additional weight of a solemn enactment. It must be taken, and will be taken, by every one concerned, as a repetition of the refusal of the Czar to deal with the discontent in his Empire by any other means than repression of the most summary and high-handed kind, and as a new blow to the hopes which were entertained at his accession, and which were thought to be justified by documents known to have received, or all but received, his father's assent on the eve of RUSSAKOFF's crime.

It is not possible to anticipate with any certainty what will be the effect of this fresh start in the apparently hopeless crusade against Nihilism. To begin with, the most formidable Ukases are in Russia very often little more than so much ink and paper, owing to the tremendous resistance of inertia, if not of actual ill-will, which the huge machine of Russian bureaucracy interposes in the way of their working. Ordinances quite as stringent, if less regularly codified, and narrower in their application in some cases, were in force at the time of the later attempts on the life of ALEXANDER II.; yet, but for the audacity of the conspirators, and the treachery or human weakness of GOLDBERG, it is not probable that any but the immediate actors in either of them would have been caught. The Ukase, indeed, places or maintains under a modified state of siege a considerable portion of Russia, including most of the larger towns. The officials charged with its execution can arrest, search, forbid residence, transport suspected persons from one place to another; in fact, they can do pretty much what they please with the whole population of the districts under their charge. But the very width of these powers betrays a certain weakness in them. The cook has the most admirable *batterie de cuisine* for dealing with the hare when caught; but he is not furnished with any additional powers of tracking and catching her. Hitherto it has not been that the arms of Russian Governors have been shortened, but that their eyes have been blinded. Their detectives have either not known who were the dangerous persons, and where they were to be found, and what were their intentions, or, if they have known all this, they have kept it to themselves. And yet the Ukase, while thus very unlikely to be fruitful of good, is still capable of being fertile in evil. It is a fresh challenge to the Nihilists, a fresh admission that the Czar and an unknown portion of his subjects are at war, a fresh, unnatural bandage restraining the life of the nation. If it is very hard to catch Nihilists, it is very easy to suppress newspapers, to hunt peaceful merchants about Russia, to deport and intern and arrest and banish, to keep up a feeling of panic among the well-intentioned, and foster the flame of conspiracy in those whose intentions are evil. Whatever may be the effect of states of siege, they are not historically identified with peaceful progress, with the development of half-civilized nations into higher civilization, with financial convalescence, or even with abstinence from hazardous and aggressive foreign policy. It is sometimes argued that England ought to be rather grateful to the Nihilists, inasmuch as they give Russia plenty to do at home. England does not in any case want allies of this kind; but, as a matter of fact, the designs of Russia with which alone England has anything to do are much more likely to be pushed on more boldly than to be checked owing to this cause. To Russia and Austria the troubles of the Czar with his subjects may be a pledge of his good behaviour, but hardly to England.

It is a favourite habit with Radical friends of Russia to compare covertly or openly Ukases against the Nihilists with Coercion Acts in Ireland. The comparison goes about as far as this, that there are prisoners in both cases, and persons put into them. But it would be very difficult to find two forms of revolt against authority more different in themselves, and therefore requiring more difference of treatment, than Nihilism and Land-Leaguism. The Nihilist is frequently, if not always, an atrocious scoundrel; but his scoundrelism, notwithstanding its atrocity, is neither sordid nor self-seeking. His object is not to put somebody else's purse in his own pocket. It is, indeed, very difficult to say what his object in a material form is, and the fanatical intangibility of his creed makes him the very last person to deal with by simple repression.

The more alarmed he seems to be, in the words of the authorities, the more his imagination is roused; the more the force put in motion against him, the more readily does his insane energy of resistance become. Light and air might possibly kill the germs of his disease in those in whom it has not taken deep root; darkness and repression are likely, if not certain, to foster those germs. But the Land Leaguer, though he is very often an atrocious scoundrel too, is a very different sort of person. His objects are purely material. If he is, as his American friends say, a "boss," those objects are political eminence and authority; if he is of the rank and file, they are simply as much of his neighbour's goods as he can get. Such a person is perfectly easy to deal with if sufficient energy be used. Make the prospect of material discomfort and loss more probable than the prospect of material power and gain, and he will be a loyal enough subject, because it is his interest to be so. His motives and views are thoroughly sordid and low, and they must be met accordingly. Of course, it is not impossible that there may be a few visionaries to whom Home Rule, or an Irish Republic, or even (for the tricks of fanaticism are endless) some idealized form of tenant-right is what the vague idea of the annihilation of the social system is to the Russian anarchist. But such persons are certainly very few, and, as far as it is possible to discover, they have for the most part held aloof from Mr. PARNELL's gross and material crusade. The tactics, therefore, which are as well as just in Ireland (half-heartedly as they have been hitherto applied there), are not by any means necessarily wise—not to speak of their justice—in Russia, even if it were possible to carry them out there. Experience seems to show that it is not possible. Whether it be the case that the official class itself is really leavened with Nihilism, or that the ingrained and apparently indestructible corruption of Russian bureaucracy enables the conspirators to secure neutrality, if not help, from those whose duty it is to counterwork them, it is notorious that hitherto the most elaborate and unfettered despotism in the world has fought a constantly losing battle with its foe. The new Ukase is not any more than its predecessors directed in the very slightest degree to the extirpation of the causes of the evil. It does not even take account of the existence of such causes, nor does it amount to more (so much may be granted to the *Pall Mall Gazette*) than a refurbishing and rebrandishing of weapons which have been already tried and found blunt and useless. It is in the fact of this useless renewal, and not in any specific novelty in the attempt, that the unfortunate significance of the measure lies.

#### LAND LEAGUE DOCTRINES IN GREAT BRITAIN.

THE revolutionary action of the Land League Convention in Dublin might be expected to discourage the agitation against landed property in Great Britain; but combined cupidity and pedantry are still active in urging the application in a peaceable country of the doctrines which have produced the present anarchy in Ireland. On a Highland estate a body of small tenants has, in close conformity with Irish precedent, refused to pay any rent unless a reduction of 25 per cent. is conceded. The arbitrary composition offered for a lawful debt is apparently a substitute for the standard of GRIFFIN'S valuation which has been now shamelessly abandoned by the Land League. In Scotland there happens to be no such assessment; but the principle of robbery may be applied in many forms. It may be hoped that the plagiarists of spoliation will find that the law is still strong enough to enforce the performance of obligations, and to punish the outrages which may not improbably be contemplated. The English Farmers' Alliance, and the Aberdeenshire tenants who command the sympathy of Mr. J. HOWARD and his coadjutors, have not hitherto advanced to the same stage of lawlessness. They hope, indeed, to deprive landowners of a considerable part of their property in favour of claimants who have no moral or equitable pretext for their demands; but the Farmers' Alliance for the present looks rather to Mr. GLADSTONE than to any English imitator of Mr. PARNELL. Predatory legislation, if it can be obtained, will be safer and more respectable than agrarian rebellion; nor, indeed, are the English advocates of tenant-right to be placed on a level with the priests and demagogues who preach plunder and rebellion in Dublin. The proposed

reduction of rents and expropriation of landowners by legislative methods is still the furthest limit to which democratic injustice has reached in Great Britain. Mr. GLADSTONE has, after his ordinary fashion, encouraged agrarian agitation by promising a Land Bill of which the provisions are not defined. His own convictions on the subject have probably still to be formed.

Journalists who support the purely selfish pretensions of malcontent farmers frequently repeat the Jacobinical cant of invidious contrasts between owners who are supposed to be living in luxury and the hardworking cultivators of the soil. The same argument may be more plausibly used against the possessors of any other kind of property. If the acquisition and hereditary transmission of wealth is not to be tolerated, it is idle to denounce, as a special abuse, the least profitable mode of investment. It is as lawful to purchase the right of receiving rent as to become a national creditor, or a holder of shares or debentures in any commercial undertaking. It is conceivable, though not probable, that the Legislature might be justified in effecting a compulsory purchase of the rights of any kind of capitalists; but the Farmers' Alliance and the Aberdeenshire agitators propose to transfer, without compensation, to another class of the community, the property which is vested in the present owners of land. In the Lothians, and on some parts of the Border, there are tenant-farmers who have 10,000l., 20,000l., or, perhaps, 40,000l. invested in their business; and, in the exercise of their undoubted right, they live and educate their families in a style suited to their pecuniary condition. There must be many small landowners who are forced to live in a humbler manner, while the holders of great patrimonial estates of course enjoy the advantages of their position. The tenants have no more right to be further enriched at the expense of the landlords than the occupiers of houses in Westminster or Marylebone to claim an arbitrary reduction of their rents or an extension of their present terms. In Aberdeenshire there are more small farms than in the Lothians, but there are also many large occupiers. The custom of the country is to let farms on nineteen years' leases; and, until lately, the practice was held up to the envy of English tenants. The leaseholder at his first entrance on the farm is often a stranger who has acquired his interest in the open market, and he has not a shadow of claim to the continuance of its tenure at the expiration of his term. It is well known that both in Scotland and in England an agricultural lease is a one-sided contract, inasmuch as the landlord cannot practically insist on retaining a tenant who, finding that he has made a bad bargain, desires to surrender his farm. During the late depression hundreds of leaseholders have demanded and obtained reductions of rent, or entire release from their contracts, with almost as little obstruction as if they had been tenants from year to year. A reasonable claim on the liberality of the landlord has perhaps not arisen as frequently in Aberdeenshire as in the South. Since little wheat is grown in the county, American competition has only affected the farmers through the increased importation of cattle; and there has been no large or permanent depreciation in the value of stock. The bad seasons which have recurred in all parts of the country have been much less injurious to oats and turnips than to the products of arable districts in more genial climates.

The vicious principle of the Irish Land Bill is producing its natural effect in other parts of the country, as well as in Aberdeenshire and Bedfordshire. At a late meeting at Carmarthen, Mr. POWELL, member for the county, courted the favour of the farmers by announcing that they were justly entitled to fixity of tenure; and Mr. DUCKHAM, member for Herefordshire, himself a tenant-farmer, recommended the revival of the REBECCA riots, which involved, as perhaps Mr. DUCKHAM was not aware, one brutal murder. It is unnecessary after recent discussions to prove that fixity of tenure involves both the judicial assessment of rent and the right of selling the tenant's interest, with the result of ultimately raising the rent to the highest point. Mr. POWELL was perhaps scarcely conscious that he was recommending barefaced robbery. The term of confiscation is inapplicable, as it implies expropriation for the advantage of the national Treasury. Arbitrary transfer of property to a class which commands a majority of votes is a more shameful innovation. The Welsh farmers have been, on the whole, comparatively prosperous during the late depression, except in

some districts which have suffered from diseases of sheep. There is no reason to suppose that in such cases the landlords have been wanting in liberality; and, in fact, the tenants are perfectly contented; but probably their honesty may not be proof against the blandishments of a member who proposes to pay his constituents for their votes by handing over to them a portion of the property of their landlords. The Principality is indebted to Mr. GLADSTONE for another mischievous precedent in addition to the Irish Land Bill. The Welsh Sunday Closing Bill is in itself a measure of secondary importance, and it has probably effected its principal object in confirming the political devotion of the Welsh Dissenting preachers to the Minister. It may perhaps also have been designed as a preparation for separate Welsh legislation in matters of graver importance. Mr. POWELL's suggestion of plunder was nominally confined to Wales, though it would be neither more nor less unjust in England than in the Principality. Mr. GLADSTONE, himself a Welsh landowner, may probably have contemplated provincial disestablishment rather of incumbents than of landlords.

The Trade-Unions Congress, among its many political excursions into provinces remote from its proper functions, recommended the enactment of a Land Bill which the managers of the Congress judiciously abstained from defining. The assembled delegates probably disliked landowners as an aristocratic class; but it is also possible that they may have been deluded by the economic fallacies of numerous theorists. In one of their resolutions they expressed the opinion that it was desirable to produce the largest amount of food from the soil; and of course they forgot, in common with their literary instructors, to refer to the cost of production. No other country is so cheaply, and therefore so profitably, cultivated as England. If the soil were made to produce half as much again by the efforts of double the number of cultivators, the result would evidently be an economical loss. That the present occupiers would work to greater advantage under an altered law is in the highest degree improbable; and ambitious tenant-farmers may be well assured that they are not the objects of the sympathy of the Agricultural Labourers' Union, which induced the Congress to meddle with the land question. The artisans probably believe that they would in some indefinite manner derive advantage from the establishment of a peasant proprietary. A middle-class aristocracy of large farmers would greatly resemble the manufacturers for whom the Trade-Unions entertain but a qualified feeling of attachment. The elections in North Lincolnshire and Cambridgeshire probably represent the real opinions of intelligent tenant-farmers. They cannot but be aware that, though Mr. GLADSTONE rewarded them by the Ground Game Bill for their support at the general election, he is about to transfer their political influence to the labourers, who will in turn receive some electoral bribe, probably at the expense of their employers. It may also be hoped that reasonable farmers will scarcely demand a right to retain their occupations in perpetuity while they retain the privilege, which they frequently exercise, of throwing up their farms at pleasure.

#### THE FRENCH COMMERCIAL TREATY.

WHEN a foreign Government reaches a decision which is on the whole convenient, it is well not to criticize too minutely the steps by which it has arrived at that decision. The French Minister of Commerce appears to have spent his leisure hours, since the close of the elections, in studying the QUEEN'S Speech. He has, consequently, seen cause to change completely his estimate of the prospects of the commercial negotiations which came to so sudden an end not long ago. He and his colleagues have, it seems, been all along sincerely anxious to conclude a new treaty with England. Had they been left to themselves they would gladly have met the English demands half-way. It is not the will, but the ability, that has been wanting. As Ministers they must be guided by the decisions of their Parliamentary Assemblies; and by one of these decisions the Government were forbidden to prolong the treaty then in force, without an assurance that a new treaty would be concluded at an early date. When the negotiations came to an end in London M. TIRARD was unable to feel any such assurance, and he therefore had no choice but to decline the proposed prolongation. In the QUEEN'S Speech he found all that he wanted. The contingency contem-

plated by the French Legislature had been realized. The required assurance that a new treaty would be concluded at an early date was at length forthcoming, and the French Ministers were free to agree to the prolongation of the existing treaty. M. TIRARD'S statement is entirely correct. The French Government were bound by the decrees of their Parliamentary Assemblies, and the QUEEN'S Speech on proroguing Parliament proved that the English Government wished to conclude a fresh treaty, and therefore presumably would make no unnecessary delay in the negotiations. What M. TIRARD did not explain was why he had himself moved the Chambers to impose the restrictions which he afterwards pleaded as a justification for his refusal to prolong the treaty, and why he had ever allowed himself to doubt the genuineness of the English desire to bring the negotiations to a speedy close. It was not necessary, however, for him to go back upon questions which have now ceased to be interesting; and, if he was not compelled to make the retrospect, it was certainly prudent to omit it.

The negotiations which were opened on Monday in Paris certainly wear a more promising aspect than those which were lately carried on in London. The French Government has, to all appearance, suddenly become really desirous of concluding a new treaty. M. TIRARD proclaims the lively satisfaction felt by the Government of the Republic at receiving the English Commissioners, and his hope that the negotiations will be rendered more rapid and easy by the spirit of conciliation which animates all who take part in them. So far as the French Government are concerned, the uncertainty which has too long hung over the commercial relations of the two countries will soon be succeeded by a definitive system. M. TIRARD will not find any opposition to this result offered from the English side. The English Government have never made any secret of their attitude in the matter. They have from the first declared that they would not accept any treaty which is, on the whole, less favourable to English trade than the treaty of 1860. There are many points even in that treaty which might be modified to the advantage of this country; but the Government has never made the concession of these modifications an indispensable condition to the conclusion of a new treaty. All that they have insisted on is that the existing treaty should not be modified for the worse. Unless M. TIRARD is playing with the English Commissioners, which is scarcely probable, he would not have reopened the question merely to renew proposals equivalent to those which have already been rejected. It may be assumed, with some confidence, that England will not again be asked to accept worse terms than those which are conceded to her by the treaty still in force. What we got in 1860 we shall retain in 1881.

On the whole, this is a result with which we may fairly feel satisfied. Lord GREY has shown that there is much to be said in favour of a refusal to enter into any treaty which binds our hands as regards the imposition of duties on imports; and, if the Commercial Treaty were allowed to expire, it might be consoling to remember that England had, at all events, re-entered the narrow way of economical orthodoxy. It is not improbable that England would, in the end, have suffered less from the failure of the negotiations than France. The falling off in the exports of English goods consequent on the changes in the French tariff must have been followed by a corresponding falling off in the exports of French goods. A customer who will not take his payment in the ordinary trade way is so inconvenient a personage that nobody will buy of him when they can buy of any one else. Special articles, such as the finer Bordeaux wines, would have continued to find a market in this country, and the rise in price caused by the unusual methods of payment that must have been adopted in view of the scarcity of bills of exchange would have been too small to have much affected the sale. But as regards the great mass of goods, what the purchaser takes is largely determined by what the seller has to offer, and every substitute that could have been devised for French produce would have been pushed into the market, as giving the seller less trouble and larger profits. In this way some of the benefits which are claimed for "Fair Trade" would have been reaped by the English producer without the evils which would follow upon any concession to the Fair Trade agitation. English manufactures, which now have to fight a hard battle with French manufactures, would have found themselves favoured by the English middleman on grounds not of

patriotism but of convenience. Even the English consumer might have been the better for the impetus given by the partial closing of the French market to the discovery of new outlets for English enterprise, and in this way of new supplies for English use. It may be objected that, if this picture is true, the renewal of the negotiations ought to be a subject of regret rather than of satisfaction. The answer is that, though, when the bird in the hand has been lost by no fault of ours, it is wise to turn our thoughts to the bird in the bush, we may still feel glad when the bird in the hand has been unexpectedly recovered. The benefits which might possibly have followed upon the abolition of the conventional tariff with France belong to the class of blessings which come from adversity. Under the new stimulus Englishmen might have become more inventive and, in the end, more prosperous than they would have been without this stimulus. But we do not ordinarily throw away what we have gained on the plea that poverty will quicken our faculties; and, in the same way, we may fairly be glad to be spared a certain loss to some branches of English trade, though we have at the same time to forego possible gains to other branches.

Why M. TIRARD, after allowing the negotiations to drop, should afterwards have wished to renew them is not apparent. Nor would it be safe to assume that we have yet seen the last of Ministerial changes of purpose. It may be supposed that the French Government has seen reason to suppose that the nation is less decidedly Protectionist than they had imagined, and that the improved prospects of the treaty are due to this discovery. But the note published in the *Temps* on Wednesday shows that even now the French Ministers are not at all disposed to burn their boats. According to this statement, there has been no concession on either side. The English negotiators have not absolutely rejected the principle of specific duties; the French Government was always willing to prolong the existing treaty, provided that the negotiations for a new one were far enough advanced. It may be, therefore, that the French Cabinet is now of opinion that the nation is a shade more Protectionist than its members thought a week ago, though they still hold it to be a shade less Protectionist than they thought three weeks ago. As the position of this country in the matter is perfectly unmistakable, there is no need to be disturbed at these seeming variations of purpose on the part of the French Government. We wish to conclude a treaty which shall go further in the direction of Free-trade than the Treaty of 1860. We are willing to conclude a treaty which shall in the aggregate go as far in the direction of Free-trade as the Treaty of 1860. We are resolved not to conclude a treaty which shall from this point of view be inferior to the Treaty of 1860. Under the guide of competent experts it is hardly possible that a negotiation carried on upon these lines should go far wrong.

#### LORD JUSTICE BRAMWELL.

LORD JUSTICE BRAMWELL'S intention of retiring from the Bench had been known for some time; and yet his unabated vigour caused a kind of surprise when he actually resigned his office. It is much to be wished that other judges, and indeed all great public functionaries, would follow his example by anticipating the inevitable diminution of their efficiency. It has, indeed, sometimes happened that judges have continued to serve at an advanced age to the public advantage. Lord CAMPBELL acquired a great judicial reputation, though he had become Lord Chief Justice after seventy; and he became a competent Lord Chancellor at eighty. On the other hand, many instances might be quoted of judges who have lingered on the bench in the decline of their faculties to the great detriment of the administration of justice. It was said of one high legal dignitary, formerly an eminent lawyer, that his death, even if the vacancy had not been filled up, was equivalent to the appointment of an additional judge. The decay of the intellectual faculties seems to destroy the consciousness that they are impaired. Lord Justice BRAMWELL may possibly, like some of his predecessors, feel for a time the loss of a congenial employment, but it is much better that a certain amount of energy should be wasted than that a worn-out veteran should suggest a contrast between his former capacity and his senile sluggishness or garrulity.

Lord Justice BRAMWELL would doubtless have been for some years to come as competent as formerly to discharge his duties, but he has acted wisely in leaving the scene of his twenty-five years' labours before any question could arise as to the expediency of his making room for some younger successor.

Only professional critics fully appreciate either the importance of judicial ability or the qualities of different judges. It is not undesirable that there should be on the Bench varieties of faculty and acquirement. Men of the world, trained by long experience of ordinary litigation, are sometimes valuable judges, though they may have little pretension to the character of profound lawyers; but in all cases legal instinct and common sense are indispensable. It is sufficient that a few members of the Bench should provide for the whole body the necessary knowledge of the more recondite mysteries of the law; and the tendency of modern judicial practice is to diminish the importance both of accumulated cases and of remote legal inferences. The subtle process of deducing absurd logical conclusions from admitted principles has fallen into comparative disuse since the removal of a former generation of judges trained in the old system of special pleading. The fine analogies of law may still exercise the keenest intellect without superseding the primary duty of dispensing justice to the immediate litigants. Forty years ago the most successful practitioners were masters of the rules of a highly artificial science; and they addressed some judges who were too weak to detect their sophisms, and others who sympathized with the most elaborate display of far-fetched astuteness. The greatest judges were comparatively exempt from the failing of their colleagues, but the law which they administered was unduly technical and not sufficiently elastic. The legislative changes which have since been introduced have coincided with a growing anxiety on the part of the Bench to render substantial as well as formal justice. The inchoate fusion of Law and Equity has introduced into either system remedies which were not formerly attainable.

Lord Justice BRAMWELL was one of the most learned of lawyers. He was also a man of business and a man of the world, and he had an intellectual, as well as a moral, dislike of injustice. Even if he had been naturally eloquent, he would probably not have yielded to the temptation of courting popular admiration by oratorical exhibitions. He had no sympathy with the desire which he imputed to one of his former colleagues of having every day half a column of the *Times* to himself. His reputation for pointed, vigorous, and sometimes humorous remark scarcely extended beyond the Bar. During his long career in the rank of a puisne judge, he was regarded as one of the three or four most efficient members of the Bench; and on the constitution of the present Court of Appeal his promotion was received with the general approval of the profession. In his later office he has fully justified the expectations which were formed. It may be said, without disrespect to the surviving members of the Court, that it derived a great portion of its strength from the presence of Lord Justice JAMES and Lord Justice BRAMWELL. It is not certain that the constitution of the Court under the Judicature Act has yet reached its final shape. The stages of appeal have been unnecessarily and inconveniently multiplied; and many questions are submitted to the Lords Justices which ought to have been settled in the Court below. It has also become too frequent a practice to carry actions to the House of Lords, notwithstanding the high authority of the Court of Appeal; but the tribunal has disposed of a large mass of legislation, and it has incidentally added much to the body of law. Many theorists have objected to the judicial legislation which has for centuries been the principal element in the fabric of English law; but as long as precedents are held to be binding on coordinate and inferior Courts, it is impossible to discontinue the ancient practice. Even if Parliamentary legislation were more carefully conducted than it is, and were more systematic in its procedure, it is impossible to foresee all the legal issues which are raised and decided in daily practice. Next to the practical administration of justice, the virtual enactment of laws by the application of recognized principles to novel combinations of facts is the most important function of the judicial body, and especially of the Court of Appeal. It is believed that its decisions have been generally sound, and that they command the respect of the profession.

A controversy has for some time been pending as to the best constitution of a Court of Appeal. Several judges have taken part in the discussion on either side; and it would perhaps be unseemly to pronounce a positive opinion on the expediency of entrusting to the same persons original and appellate jurisdiction. Some writers of authority maintain that the ancient arrangement of appeals to the Exchequer Chamber was sound in principle. They consider that a judge relegated to a separate Court of Appeal loses touch of actual practice; and that sustained familiarity with litigants and with juries facilitates the application of general principles to disputed points. It would in any case be necessary to improve on the old system of the Exchequer Chamber, in which a majority of three might overrule two dissentients, in addition to four others of equal rank in the Court below; but the difficulty of framing a plausible scheme would not be insuperable; and the LORD CHANCELLOR, in the Bill which he lately introduced, contemplated the addition to the Court of Appeal of some ordinary judges. It may be true that the judge who hears a case in the first instance has a more difficult task than the appellate tribunal; and it seems to some members of the Bench a hardship that the higher rank should be combined with the discharge of the lighter duty. On the other hand, it must be remembered that most of the Lords Justices have had long experience on the Bench, and that the others have learned their business in active practice at the Bar. It probably seems to laymen that in the judicial division of labour greater skill in the establishment of legal principles is likely to be attained by judges who do nothing else. It will not be disputed that, if a separate Court of Appeal is to be maintained, the judicial qualities of its members are of the highest importance. Lord Justice JAMES has been replaced by one of the ablest judges on the Bench in the person of the MASTER of the ROLLS. The choice of a successor to Lord Justice BRAMWELL, who will almost necessarily be a Common lawyer, is not yet announced. It is not yet ascertained whether Law Officers are likely to seek compensation for the abolition of two high judicial posts by becoming candidates for places in the Court of Appeal. There is no reason to suppose that the ATTORNEY or SOLICITOR GENERAL will be a candidate on the present occasion.

#### FRANCE AND TUNIS.

IT is said that the Bey of TUNIS, believing that he was to be dethroned by the French, had determined to anticipate the affront by resigning. He has since been assured that there was no intention of appointing another member of his family in his place; and the declaration that the French Government is not about to assume the Regency has been voluntarily renewed. The BEY, who seems to have become an adept in the use of the phrases of European diplomacy, declared, in answer to the friendly communication of the French Consul, that he had never for a moment believed in the reports which were supposed to have disturbed his equanimity, and he added that he reposed the utmost confidence in his powerful ally. It is not certain whether the French propose, in conformity to an opinion attributed to General LOGEROT, the immediate occupation of the capital. Although the province is not formally annexed, the French Resident controls both foreign relations and domestic administration, and French garrisons hold all the strong places which they require for military purposes. As the English Government from the first wisely abstained from objecting to the French enterprise, it would be idle and officious to inquire too closely into the mode of establishing French power in Tunis. As violent changes are for the most part dangerous, it is perhaps desirable that the BEY should for the present retain his nominal dignity. The large portion of his subjects who may probably be inclined to side with the strongest will find in the ostensible continuance of their relation to their former ruler a sufficient excuse for acquiescing in the new French dominion. The doubtful loyalty of the Tunisian troops would perhaps scarcely be proof against a demand that they should transfer their allegiance to the foreigner. English experience in India has not uniformly shown the expediency of governing a conquered territory in the name of the native dynasty; but such fictions sometimes facilitate at the moment a transaction which might other-

wise involve a shock. When, half a century ago, the Government of CHARLES X. took possession of Algiers, no similar question arose. The defeated potentate had been the open enemy of the conqueror, and the expedition had been originally undertaken with the purpose of effecting his final overthrow. It was notorious that the provocation which he had given by piratical outrages was a mere pretext for the attempt to rehabilitate an unpopular Government by an appeal to national ambition.

The present French Ministry would perhaps scarcely have engaged in the undertaking if they had foreseen the cost and trouble which have been incurred. No effective resistance could be offered by the BEY; and the campaign against the Kroumirs was not seriously prosecuted. The agitation which has actually been caused among the native population from the sea to the edge of the desert was certainly not expected. There is no reason to suppose that the various bodies of insurgents are, in conventional language, actuated by fanaticism. The French in Algiers have never practised religious intolerance; and the Mahometans in Tunis have no reason to fear persecution of their faith. It is indeed probable that considerable animosity may have been provoked by the wanton desecration of one or two shrines or places of pilgrimage; and in Northern Africa an insurgent chief almost always combines with his warlike character some pretension to be a saint or a prophet. A graver cause of irritation is the imminent risk of subjection to an alien conqueror. The indigenous population of Algeria, though it has long since submitted to French supremacy, has never cultivated European civilization, and it probably sympathizes with the inhabitants of the neighbouring principalities, and with the independent tribes on the border of the desert. The nominal subjects of the Bey of TUNIS fully understand that he has been deprived of his sovereignty; and they are not disposed to submit without a struggle to a foreign conqueror. They probably understand little of the motives which prompted the enterprise. The desire of emerging from an inactivity continued for ten years, the profits to be acquired by speculators in Tunisian bonds or Tunisian land, the future acquisition of great naval stations, would not interest the Arab-Moors of the interior. Nothing is more natural than their resistance to the invader; but they are rapidly discovering their inability to oppose him.

The military operations excite a faint interest, almost entirely removed from curiosity. English politicians are not concerned to learn whether the despatch and recall of certain contingents was a political or administrative mistake. There can be no doubt that the French Government could, if it were necessary, easily provide 100,000 men for an African campaign without impairing their means of defence at home. It has been said, perhaps with some truth, that the shortcomings of the French military system resemble those which received abundant notice in England during the South African war; but Continental armies are maintained on too large a scale to find any difficulty in providing men for a petty war. Whether or not General FARRÉ is a competent War Minister, the necessary reinforcements will no doubt be forwarded to Tunis and Algiers as they may be required. The colder weather will from this time forward enable the generals in command to undertake any operations which they may deem expedient; and defects of commissariat or transport will be speedily remedied. In some instances anxiety has been felt for the safety of small bodies of troops which have been checked or surrounded by numerous enemies. At one time the aqueduct which supplies Tunis with water was cut; and the first attempts to restore it were unsuccessful. Not a single instance is mentioned in which an insurgent force has gained any considerable or permanent advantage. In two or three days the Arabs were driven from the line of the broken aqueduct, and the water at the date of the last accounts was flowing as usual. General SABATIER, whose communications were temporarily interrupted, has been reinforced by Colonel CORBÉAUD; and the reinforcements which are now every day disembarking will prevent the recurrence of unequal conflicts. If the bulletins may be trusted, the losses of the Arabs in every successive skirmish are twenty or thirty-fold greater than those of the French detachments. The statements are the less incredible because the insurgents have neither cannon nor small arms of precision. They are most formidable as irregular cavalry in their attacks on baggage trains and

convoys of cattle; but the increasing number of French troops will finally ensure their superiority.

It will probably be found expedient to ensure the success of the campaign by the employment of overwhelming force. English generals in the Colonies, and even in India, are generally compelled to rely on their advantages in armament and discipline against superior numbers; but there is no advantage in universal military service if such a Power as France has to contend with uncivilized tribes on approximately equal terms. The men are at the disposal of the Government, and the provision of carriage and stores involves only a question of expense. When the insurgents find that at every point of collision they are both outnumbered and outfought, they will probably see the inutility of prolonging their resistance. Some tribes have already tendered their submission; and the stationary population of the Regency has by this time ascertained the imprudence of displaying the sympathies which it may probably have entertained. The French will certainly be victorious in the end; and it depends on the vigour and wisdom of their counsels whether they bring the war to an early termination. When they have firmly established their power, they will have time to consider whether the enterprise was worth its cost. The finances are flourishing, and it would seem that a large expenditure is not unpopular in France. The opportunity of administering a lesson to hostile tribes may perhaps confirm the security of French dominion in Algeria; speculative capitalists will applaud the energy which has doubled the value of their investments; and patriotic vanity will be gratified by the rebuff which has been inflicted on Italy, and, in popular estimation, on England. On the whole, the result of the undertaking will probably afford little ground for the hope that it will be the last experiment of the kind. The revival of the French appetite for glory is a misfortune to the rest of Europe.

#### IRISH JURIES.

THE letter in which Mr. FORSTER declined to accede to the modest request of Mr. DICKSON and Mr. GIVAN, that he would turn the "suspects" loose upon Ireland, was printed in small type in most of the daily newspapers, and received but little comment. Yet it is a document of some value, and, taking it altogether, may be said to be the most satisfactory utterance of the Government since the beginning of troubles in Ireland. Mr. FORSTER points out to the importunate Ulster members that the persons incarcerated are incarcerated not as a punishment, however richly they may have deserved it, but as a measure of prevention and precaution. They are reasonably suspected of being centres of disturbance in the neighbourhoods in which they respectively live, and they are held in custody partly as hostages and partly to prevent their acting as firebrands. To demand an amnesty for them, therefore, is simply silly, and amounts, not to asking pardon for a murderer after his crime, but to asking that, having been arrested in the midst thereof, he shall be replaced at the throat of his victim with knife and all apparatus appertaining to his trade. Of course Mr. FORSTER does not put the matter quite so straightforwardly as this, but he says the same thing in conciliatory language. If Ireland wants the suspects out of prison, she has only got to behave herself. Each district, by refraining from outrage, submitting to the law, paying its debts, and abandoning the conjugation of the verb to Boycott, can have its own hostages back again, on the condition, of course, of re-arrest if disturbances recommence. But so long as outrages, and Boycotting, and resistance to the law continue in any given district, so long will certain representatives of that district continue to inhabit Kilmainham. There can be nothing fairer than this; and the only thing to be hoped is that the Government will persevere in this course, in spite of the ignorance or sophistry of those of their followers who clamour for an amnesty. Sir MICHAEL HICKS-BEACH was quite justified in complaining that the sweep of the Coercion Act has been far too narrow; but it would be worse still if the fish actually within it were let slip.

Conciliatory as was his language, Mr. FORSTER was obliged to admit that the improvement which it seems he discovered is only partial. It may perhaps be said that impartial lookers-on find a great difficulty in discovering any improvement at all of the kind which would

justify the letting loose of the agitators. What improvement there is is due chiefly to the better organization of the law-abiding inhabitants, and partly to the unsparing use at last, and after the loss of much precious time, of military force. As the winter approaches, outrages again increase. Boycotting, if not individually so oppressive owing to the organization just mentioned, is more widespread than ever, and the defeat of Justice in her own courts is still constant. The Blue-book recently issued on the Irish Jury Laws, containing the Report of a Select Committee of the House of Lords and the evidence taken before it, exhibits this latter evil in its fullest proportions. The evidence is even of more importance than the Report, though this latter cannot be poohpoohed even by the staunchest decriers of the House of Lords as the result of a partisan inquiry. Notwithstanding the Conservative majority in the House, the Committee comprised an actually preponderant number of Liberals (unless Lord DERRY is to be counted as a Tory); and two of the Conservative members—the Duke of MANTHOROUGH and Lord INCHQUIN—were not present on the final question of adopting the Report. This division, too, concerned only a proposal for temporary suspension of trial by jury, for which there voted, not merely the Marquess of WATERFORD, Lord DONOUGHMORE, Lord LONGFORD, and Lord ARDILAWN (who may be supposed to have had political reasons for their votes), but the Marquess of LANSDOWNE, Lord DERRY, and Lord PENZANCE. The body of the Report, setting forth the unsatisfactory state of things as a matter of fact, seems to have expressed the unanimous opinion of the whole Committee. Nor, indeed, would it have been possible for any assembly, unless possessed of the courage of an Irish jury itself, to come to any other decision in face of the evidence. Judges, sheriffs, clerks of the Crown, Crown solicitors, solicitors and barristers unconnected with the Government, stipendiary magistrates, and unpaid magistrates were unanimous in declaring that the present jury list furnishes a class of persons too ignorant to be even safe arbiters of ordinary causes, but utterly and radically untrustworthy in respect of "clean" crimes—that is, outrage and even murder, committed from agrarian, religious, or political causes. The most striking evidence of all was that of Serjeant O'HAGAN, who has since been selected as Judicial Commissioner under the Land Act, and who is loudly claimed by the Leaguers as a sympathizer. Serjeant O'HAGAN, while manifestly disinclined to speak hardly of his countrymen, and while unwilling to recommend a return to the older and more exclusive plan of summoning juries from the higher classes, admits that in a large experience he found it necessary, even in ordinary cases and ordinary times, to guard most carefully against the uneducated and excitable jurors being induced to neglect the evidence, while he frankly admitted that in times like the present convictions in disturbed districts were impossible. This, the weakest evidence in actual expression, is thus really the strongest, and it would very nearly settle the matter even without the enormous and practically overwhelming mass of testimony by which it is accompanied.

The Committee recommend various palliatives, such as the merging of the Grand Jury and Special Jury list in that of the Common Jury, the insistence on a certain proportion of the former element in each case, and the limitation of the present preposterous right of challenging which is avowedly used (we have still Serjeant O'HAGAN as a witness) to "emasculate the panel" by rejecting all men of station and intellgence. But in the contentious portion of the Report before referred to they admit with reluctance that such measures, as well as that of freely changing the venue, though not unlikely to succeed in quieter times, would be useless at present. A considerable enlargement of the summary jurisdiction of magistrates, and, in extreme cases and for limited periods, the suspension of trial by jury altogether, is what they recommend. In this recommendation, let it be remembered, Lord PENZANCE, a decided Liberal, and a lawyer of hardly surpassed experience, and Lord DERRY, whose repugnance to unusual and heroic measures of any kind is perhaps the most striking feature of his character, both agree. Nor is it easy to conceive it possible for any one to read this collection of evidence carefully and impartially without coming to the same conclusion. Trial by jury, after all, is nothing more than a means to an end, and that end is the doing of justice. From the moment when it is proved that it is incom-

petent to bring this about—that, on the contrary, it is simply a convenient instrument for defeating justice—its value and its sacredness are gone at once. This point has been reached in Ireland. There are two main causes which produce the untrustworthiness of Irish juries, one of which is more or less under the control of Government, while the other is almost wholly beyond it. The first is terrorism, the other is ignorance and prejudice. By a great increase of vigour in administration it might be possible to terrorize the terrorists; but the ignorance and the prejudice which, as one of the witnesses before the Committee tells us, make Irishmen of the class from which petty jurors are mostly drawn divide crimes into “clean” and “dirty” are unattackable save by time. As matters stand, the setting of an average Irish jurymen to try an average Irish criminal is a kind of practical fallacy of ambiguity. The law which the jurymen chooses to acknowledge and the law which he is set to administer are two entirely different things. The case is not parallel, as is sometimes argued, with the cases where, owing to a revolution in public opinion, a heavier penalty is imposed by the law than seems generally just, and where juries acquit in consequence. The Irish jury which acquits a man of murder does so not because it thinks imprisonment or fine more suitable to the case than hanging, but because it thinks the murder no murder at all, but a highly virtuous and laudable act. This being the case, it is obviously useless to play at cross purposes. If agrarian, political, and religious motives are to be a good defence to a criminal charge, let them be made so by law; if not, let not the law permit a farce, every repetition of which encourages to lawlessness. The evidence which lies before us shows that a considerable portion of the Irish people are incapable of exercising certain rights. In the interest of those of their countrymen who have reached a higher state of civilization, those rights should be withdrawn from them.

#### INDIAN RAILWAYS.

THE Report upon the Indian Railways for 1880-81 is principally interesting as being the first to contain the newly-devised distinction between “Productive” and “Protective” works. The special discussions connected with Indian famines have already made us acquainted with these terms, but the Railway Report for the past year shows them reduced to ordinary use. “Productive” works, as is explained in the Report, are works paid for out of borrowed money, and calculated to yield within a prescribed time such a clear annual revenue as will cover the interest on the capital expended. Before a railway can be classed among “productive” works, there must be a reasonable prospect that within five years of the line being opened for traffic the earnings will yield interest at 4 per cent. upon the whole capital outlay, including arrears of interest incurred up to that date, the capitalized value of the land revenue, and sundry other charges. In the case of irrigation works, the rate of profit to be ultimately realized is also fixed at 4 per cent., but ten years instead of five are fixed as the period within which this rate must be realized. For the present the Government of India will not borrow for productive works more than 2,500,000*l.* a year, the larger part of which is spent on railways, while the rest is divided between canals and miscellaneous works. Besides works which answer to this definition of production, there are others which will sooner or later yield a revenue out of which interest may be paid on the capital expended, but which are likely to do so later rather than sooner. “It would be difficult in India,” says the Report, “to find a district “where a railway would not be the means of developing “trade and stimulating agricultural produce, and thus “obtain a traffic which would become remunerative.” But to lock up capital in the construction of works which are not immediately remunerative is one of the commonest and surest methods of bringing about depression of trade and general financial distress. A Government which can only just pay its way would be greatly to blame if it started on a wildgoose chase after profits which are only likely to be realized in the next generation. If private investors like to put their own money where it can yield them nothing for half a lifetime, they will be the only sufferers; but a Government which acted in this way would be preparing an inevitable weight of taxation for

the unfortunate subjects whose money it had chosen to mispend.

India, however, is to some extent an exception to this rule; or, to put it more accurately, an immediate profit of a particular kind arises out of works which in other countries would be unproductive. The railway which would be many years before it paid 4 per cent. on the capital invested in it may pay a percentage of incalculable value the very year in which it is opened if it enables food to be brought from a district in which it is abundant to a district stricken with famine. The increase of production traceable to irrigation works may not in ordinary years be sufficiently great to make any conspicuous improvement either in revenue or in trade. But, if it furnishes the people of the district with enough food to support life during a scarcity, and so prevents scarcity from developing into famine, it will have yielded an abundant return on the cost of construction. It has been determined to spend on “protective” works in each year, when there is no famine, half the sum set apart for a Famine Insurance Fund. If this limit is adhered to, and the expenditure is restricted to 750,000*l.*, “a long “time must elapse before a complete scheme of protection “can be finished.” But, if the finances of India go on improving, it may be possible, and certainly would be expedient, to devote a larger sum to this particular class of works. Possibly there are reductions and adjustments of taxation which ought to be made even before any more money is spent on any other object whatever. But the extension of protection against famine may at least claim the second place in the list of objects demanding the attention of the Government. The cost of a preventable famine is very great, both as regards the amount spent and the revenue lost, and any outlay which has the effect of warding off a famine, if it is not extravagant in amount, is really a saving of public money. It may be hoped, too, that the expenditure on productive works will incidentally provide additional security against famine. Thus the Ganges Canal, which was undertaken nearly forty years ago as what would now be called a “protective” work is in a very high degree a productive work also. It not only irrigates considerably more than a million acres, and so is an instrument of inestimable importance, as Lord HARTINGTON has said in a recent despatch, “in securing harvests, in improving “the agriculture, and in promoting the prosperity of “the provinces through which it runs,” but it returned for the year 1878-79 nearly 7½ per cent. on the original cost. At this rate the revenue of the canal will be large enough to pay off all the interest which had accumulated before the canal paid its expenses, and to return 4½ per cent. on the capital. There may be other canals only waiting to be made of which an equally good account may be hereafter given. It is quite right that a limit should be placed even on works which, as in this case, are at once protective and productive; but, by giving the preference to those productive works which are protective at the same time, the construction of protective works may go on very much faster than would be possible if only the allotted 750,000*l.* were yearly spent on them. In future, the Report on Indian Railways will deal with canals and irrigation works as well. They are certainly matters of equal public importance, and information relating to them ought to be equally accessible.

Still, even if the money is laid out in the most prudent fashion possible, a capital expenditure of 2,500,000*l.* a year must leave many very pressing wants unprovided for. The limit is a wise one, but it is not the less a limit; whereas the demand for railways and canals in India is almost without limit. It becomes, therefore, a question of very great interest whether there are any means of promoting the investment of English capital in Indian undertakings which the State may prudently employ. Hitherto the only inducement that has proved strong enough has been a State guarantee; and, where private enterprise will not be content without a State guarantee, the State may as well do the work itself. When Major BARING became Finance Member of Council he was instructed by the SECRETARY of STATE to encourage in every way the raising of capital through private agency, “on “the exclusive security of the success of the under- “taking.” If this proves impossible, Lord HARTINGTON is willing to entertain the consideration whether a modified guarantee might not be given, meaning by this

a guarantee "so restricted in respect to time and to the rate of interest guaranteed as to give the subscribers a real interest in the efficient and economical administration of the railway." Major Baring dwelt at some length upon this point in his Budget statement. He is not very sanguine as to the possibility of developing the resources of India rapidly through private as distinguished from State enterprise, but he thinks the experiment is worth a trial. The gain to the State would be great, and the conditions under which the attempt would be made differ in some important respects from those which were formerly held to make success impossible. Railways in India pay better than they did, and there is at once more capital seeking investment and less opportunity of investing it profitably. The first private Railway Company has been already formed, under the title of the Bengal Central Railway Company, and it has been started with the countenance of Messrs. ROTHSCHILD. If names have any influence, this Company ought to be popular. Major Baring suggests several ways in which Government encouragement might be given to private capitalists short of an actual guarantee of interest. Government officers, he says, may make the surveys and estimates which are required before the public can prudently decide whether to invest money in any particular scheme; the land taken for the line may be given free of cost; and grants of waste land in the vicinity of the line may sometimes be made to the Company. In this way the shareholders would derive profit not merely from the traffic created by their line, but also the increased prosperity of the district through which it passes. Diminution of preliminary cost and enlargement of the dividend-producing area may go far to make Indian investments popular with a generation which is perplexed to know what to do with its money.

#### MANCHESTER SMOKE.

THE Manchester Correspondent of the *Times* has started a controversy of some interest—Ought a wholly new departure to be taken with reference to the prevention of smoke? As the law stands, manufacturers are ordered to consume their own smoke; but the persons at whose instance the prosecutions for breach of the law have to be instituted are themselves very often the most conspicuous offenders against the law. In two recent cases at Salford the heads of the convicted firms had both been Mayors of Manchester, and it is a not uncommon complaint in the district that the "owners of offending chimneys are always to be found in high places." The prosecutions are instituted by a local Nuisance Committee, which naturally represents with substantial accuracy the opinions of the manufacturers whom it is its business to keep in order. What these opinions are may be gathered from some of the reported utterances at a late meeting of the Manchester City Council. It was brought before the notice of the Council that, of 578 trees planted in three years by the authorities, 203, or considerably more than one-third, were dead. This fact might have suggested the moral that what is so fatal to vegetation can hardly be very beneficial to human life or health. This was not, however, the light in which the Manchester City Council looked at the question. They preferred to say with cheerful humility that they could not make Manchester a second Paris, whatever they did. Another speaker compared the opposite evils of smoky and smokeless chimneys, and congratulated the Nuisance Committee upon their wisdom in declining to push their purifying efforts to an inconvenient extreme. This same gentleman declared that the healthiness or unhealthiness of Manchester was merely a matter of acclimatization. There was nothing much the matter with the atmosphere of the city when once you had got used to it. With local opinion in this condition, it is not to be expected that much local energy will be shown in dealing with the smoke nuisance. It is true that the Nuisance Committee has called attention during the year to 4,500 smoky chimneys, and that nearly 700 have been imposed in fines. But the only real test of the adequacy of a system of punishment is the continuance or cessation of the evil complained of. If the Nuisance Committee is so lynx-eyed in the detection of smoke, why is it that so much smoke is still to be seen? It does not appear that in this respect Manchester is any better off than it was before the Act for preventing smoke came into operation.

The remedy suggested for this state of things is the substitution of central for local supervision. The reason why the law is broken is that it is cheaper in the first instance to break it than to keep it. There are ways of consuming smoke which would require large alterations in the construction of furnaces, and there are ways which would require fewer alterations in the furnaces, but would necessitate the employment of a better class of firemen. Both these methods imply an immediate outlay to obtain a distant return. Manchester manufacturers do not as a rule dislike the sight of smoke. It is true that most of them live away from their factories, but the distance is not so great but what some of the smoke follows them home. As they do not dislike it, the only motive other than that of fear of prosecution to which they are amenable is the prospect that, if they make their furnaces smoke-consuming, they will burn less coal or give out more heat. It is probable that in the end this result would be obtained, but the outlay would have to be incurred at once, whereas the interest on the outlay would come in slowly. The consequence is that the manufacturer, ordinarily speaking, is under no effective inducement to make the necessary alterations in his furnaces. Why should he make them? Not to clear the atmosphere of the city, for he is very well contented with it as it is. Not to escape legal penalties, for, with the uncertainty that they will ever be inflicted and the certainty that if inflicted they will not be large, it is as cheap to risk them as to avoid them. Not to save coal, for in order to get more heat out of his furnaces he would have to put more money into them. In the absence of an adequate motive to do anything, the most natural thing is to do nothing, and this pretty well describes the action of the Manchester manufacturers as regards the consumption of smoke.

All this, it is argued, would be completely changed if the prosecution of offenders against the Smoke Prevention Acts were vested in a representative of the central authority. "A Government Inspector and a stipendiary magistrate would make a speedy end of the nuisance." Small as the penalties are in themselves, they would become large by frequent repetition, and, in the end, when convictions followed one another almost daily, the sinners would find it cheaper to make the necessary alterations than to pay the accumulated fines. Without a Government Inspector to undertake prosecutions, a stipendiary magistrate can do very little. The local Committee by whom prosecutions are now instituted can pick and choose between the cases which call for notice, and in the end only a fraction of those which ought to come before the magistrate ever do come before him. It cannot be otherwise so long as the authority which decides when to prosecute and when to abstain represents the average opinion of the city. Manchester is so far improved that there are some cases which there is no desire to screen. They are considered to outstep the limits beyond which disregard of the law ought not to go. A case mentioned by the *Times* Correspondent, in which "dense smoke was emitted for an aggregate of twenty-seven minutes in one hour," probably belonged to this class. Local opinion does not uphold a man in breaking the law for twenty-seven minutes out of sixty. If dense smoke had been emitted, say for ten minutes out of sixty, it is probable that a different view would have been taken. Yet, if a number of neighbouring chimneys are each sending out black smoke for ten minutes in the hour, the ultimate effect upon the atmosphere may be quite sufficiently mischievous. The more energetic the stipendiary magistrate is, and the more determined to put down the smoke nuisance, the more necessary the Committee feel it to deal tenderly with offenders. One manufacturer must not be proceeded against because he has had great difficulties to struggle against; another escapes because his furnaces are old-fashioned and times have not been good enough to allow of their being replaced; a third is really not a worse offender than the two former, and it would be invidious to single him out for punishment. It is easy to imagine the various excuses which an easy-going Committee—wishing perhaps to steer a middle course between over-severity and undue lenity, but thinking the former very much the worst extreme of the two—would accept as, on the whole, sufficient to excuse a prosecution. If the duty were committed to a Government Inspector, there would be none of this desire to screen breakers of the law. He would have a specific work to do,

and he would be stationed in Manchester for the sole purpose of doing it.

There is no question as to the adequacy of the remedy that would thus be set to work. Given a Government inspector prosecuting every case in which the law was broken, and a stipendiary magistrate convicting every defendant against whom a breach of the law had been made out, and Manchester manufacturers would soon find that it was less troublesome to reconstruct their furnaces than to stand exposed to the constant shower of small fines. But when this has been conceded we have not got very far. It is plain that a law of this kind, if it is carried out by the central authority at all, must be carried out impartially. Where would be the impartiality of keeping an inspector and a stipendiary magistrate at Manchester for the express purpose of compelling manufacturers to adopt proper smoke-consuming appliances, and allowing the manufacturers of a score of equally smoky towns to go on polluting the air at their pleasure? If the application of the law is regarded as a disadvantage to the producers of smoke, why should one sort of producers be more hardly dealt with than another? If it is regarded as a benefit to those who have to breathe the smoky air, why should the inhabitants of Manchester be picked out from the rest of Lancashire and Yorkshire for the reception of this special favour? Consequently, the only way of carrying out the law by the central authority in Manchester would be to impose upon the central authority the duty of carrying it out in all specially smoky districts. In other words, a new and very much more stringent statute would have to be passed. In order to carry a measure of this kind through Parliament, there must exist a strong public opinion out of doors, and in the present case where is this strong public opinion to be looked for? Not in Manchester itself; so much is clear from the fact that the ground on which it is proposed to supersede the Nuisance Committee is that the Committee represents local opinion, and therefore is very tender to smoky chimneys. If the Manchester rate-payers were in earnest upon the smoke question, they would take care that an energetic Nuisance Committee was appointed, and then there would be no need of a Government Inspector. Nor is it to be looked for in the country generally; for the obvious reason that people can hardly be expected to feel very keenly for annoyances to which they are not exposed, and which those who are exposed to them do not seem to mind. If the citizens of Manchester had not the power of compelling manufacturers to consume their own smoke, there would be no difficulty in passing a law which should give them that power; but when it comes to appointing special officers to enforce the law on their behalf, it is not wonderful that the country at large should feel that it is not bound to help those who show no disposition to help themselves. No doubt there is a minority in Manchester which would like to enforce the law, but they must not hope to escape from the universal principle that before a minority can give effect to its wishes it must make itself the majority.

#### THE DAMASCUS OF TO-DAY.

ON a moderate computation a horde of some five hundred travellers out of the crowds who annually visit Egypt pass on to visit the capital of Syria. Out of this number we may dread that two or three will enrich the world with new books. We know by experience that nine out of ten will return to their homes in the proud conviction of having become authorities on all things Eastern. The bases of their confidence may be rather shaky; but in the same way that a man who can ask for a glass of water in French can obtain credit for a mastery of the language amongst those who know nothing of it, so a tourist who has enjoyed the foretaste of Paradise which the Prophet denied himself, by violent self-assertion may manage to pass for a wise man of the East amongst his acquaintances who have never gone further than Italy. Because things seen are mightier than things heard, these *illuminati* trade on their week of actual sight to pronounce deliciously sweeping opinions, recking little of possible antecedent theories or thrice-proved truths and caring less for the information gained by stay-at-home friends who read. Talk not to them of books; did they not brave the dangers of the Damascus road in the diligence, raising themselves with enthusiasm at the bidding of their dragoman as the team of six dashed over the Barada, turned the last corner past the Salahiyyeh, and came trotting past the Merj into the oldest city of the world? Who ought to know more about Damascus than the tourist who passes a day or two there under the personal conduct of Cook? What

better judge of Damascus houses than he who is installed in Dimitri's *salon de lecture* with its two raised daises, its central fountain and painted walls? Who is more at home in her bazaars than the man who has strolled through them with his dragoman and bought a pair of red Bedouin boots or a chocolate-coloured kefia? As for the mosques, he paid his fee and saw them all, but did not think very much of them. He admires the irony of the ancients who called their big street "Straight," and is sceptical about St. Paul's window, but thinks there is no harm in the story. Altogether he was never impressed with any peculiar sense of being an actor in one of Scheherzadeh's tales, and was not sorry to leave for Haalbec, for he considers that, however interesting Damascus may once have been, it is not the gayest of resting-places now for a man who goes abroad to amuse himself. So he does not understand the raptures of some writers on the subject, and much prefers Cairo, which has at least a decent carriage road or two and an opera-house.

Have we not heard this verdict often enough to answer for its reputation as that of the majority? Damascus—alas! that we should have to say it—is dying in a feeble old age. Perhaps, therefore, her decadence is rightly judged as being of attraction inferior to the new life elsewhere, especially to the gay butterflies who pass in a day. They see nothing of the reality of Damascene life; and no wonder that the Mosque of St. John, with glimpses of leafy gardens and very dirty streets, seems scarcely an adequate reward for the pains of travel. Yet these are the impressions with which most visitors have to be satisfied; and it is difficult to show them the pleasing side of the picture, which it takes months to learn, in a page of print. It is an incontrovertible fact, even to her greatest admirers, that Damascus of to-day is not the Damascus of the past, nor even of thirty years ago. For most reasons this is a cause for regret; for some it is rather a matter for congratulation. The most unhappy feature in the change is the substitution of copper for gold, actually and figuratively; and the most creditable is the reduction of an outrageous fanaticism within somewhat moderate bounds. Damascus has always been, and probably will continue as long as she exists to be, the most orthodox centre of Muhammadanism with which Christianity has been brought in contact. This contact has been softened down elsewhere long since, but is still rough in Syria. Still, things are much improved, and the favourite myth that no European lady could go beyond her house unattended has been exploded by experiment and practice. Indeed, as a matter of personal observation, it is worth knowing that the bazaars of Damascus are the only ones in the East where a stranger, lady or gentleman, is suffered to enjoy the sweetness, long drawn-out, of a thorough bargain without impertinence from bystanders or officious interference from Jews and brokers. There is always real business being done in coin of the realm and in barter of interior produce against the wares of the storekeepers. Though all are interesting, the most attractive section to a stranger will probably be the Bitt Bazaar, where all manner of stuffs are exposed, and where the din of the auction is to be heard every day. There is no representative of the Stamboul Bezestân, or of the Charshi of Cairo, for the sale of antiquities of native work and articles of *vertu*. Trade in these is limited, and mostly confined to a couple of months of the year, and to the operations of the well-known Abou Antika, whose fortune enables him to ask unheard-of prices in utter indifference as to their acceptance or rejection.

All old work has disappeared, and anything really good in brass, steel, or silk is as rare as it is valuable. The manufacture of the peculiar heavy silks of shot colours has now died out, not being able to survive the competition of third-rate goods from European looms. The Damascus sword-blade has passed into the category of things we often read about, but seldom see, and the brass-workers seem to have lost their cunning. Their present productions are rude in the extreme, and of no artistic merit whatever. At first it may be a matter of surprise that more relics of past excellence should not come into the market, but this must be accounted for by the supposition that there are foreign agents always on the watch to buy for the Cairene trade. In no other way can we explain the notorious fact that, while a year or two of residence in Damascus will not be likely to produce a respectable purchase in brass or silk, beautiful specimens of both these branches of extinct arts are always on view in Egypt, and are replaced as soon as sold. The silversmiths are also poor workers, and their bazaar is disappointing, containing little that is tempting, except perhaps some Bedouin girl's massive silver necklace, which, in spite of its resemblance to a dog-collar, we have seen worn by an Englishwoman with good effect. As a rule, however, barbaric ornaments do not become Europeans, since they show only to full advantage on their rightful owners. For a bright kefia we want an Arab's face and eye, and every one knows how different a clumsy silver bracelet looks on a white arm compared to the same on a fellah's brown skin.

The saddlery shops, which form a long street whose wealth of colour is almost blinding, are well worth a visit. The weight of trappings, fringes, tassels, and bells that a well-conditioned man's horse has to carry in Syria alone could keep alive such an industry. In England and elsewhere the most salient points of a horse are scarcely his feet and his tail, but if *carre-blanc* be given to a Damascus caparisoner he will leave little else of the animal visible. From the frontlet depend heavy fringes to cover his face, and a large breast-band is hung with bells and tassels of unequal lengths, often reaching down to the knees. With all this there yet remains the saddle-cloth on which the greatest efforts are

lavished, till it is braided and broidered and studded with shells into sufficient splendour. The time to see the horses and horsemen of Damascus in their glory is about sunset on the Merj and the neighbouring road, where they are regularly exercised. If the master does not ride a groom is sent out, and the young foals gambol loose by their dam's side till they are old enough to be ridden, which is at an early age. Their education begins often with learning the *rahwân* pace, which is much esteemed. It is generally taught by tying the feet on the right and left side together each to each—the right front to the right hind, and so with the left. An animal who excels in this kind of amble is worth a large sum, be he ever so ill-bred or poor in appearance. The value of the accomplishment lies in its comfort to rider and ridden, for so smooth is the pace that a brimming cup of water may be held at full speed without spilling, and so easy is it for the horse that a well-trained one is supposed to cover the distance between Damascus and Beyrout in eight or nine hours. When we consider that the actual length of road is seventy-two miles, twice ascending and descending several thousand feet in crossing the ranges of Lebanon and Anti-Lebanon, the performance is certainly creditable.

All the beauty and half of the enjoyment of Damascus depends on the river Barada. The justice of the remark of him who was bidden to wash in Jordan must strike any one who has seen the two streams. The Abana is certainly a better river than any in Palestine; and the Damascenes, in their primitive manner, have taken advantage of it to the full, so that it has become part and parcel of their lives. It filters through their Liwans, breaks out into fountains in every court, is a free and lawful drink at every step, is music to the ear and delight to the eye. A maghileh, a cup of coffee, and the Barada comprise the elements of a perfect *kief*. To those who do not know what *kief* is we can only answer that it is hard to be defined, and must be practised to be understood. It is a rest that does not presuppose labour, a relief that scarcely implies previous care, a mental exaltation by mental effort only, and a dream that fulfils itself. It does not exist in the West, for things move too fast there; but it is a treasured possession of the Oriental, which neither armies, treaties, nor fleets can take from him.

Damascus, however, is declining, and one of the outward visible signs is the want of social entertainment. Not twenty years ago scarcely a night passed without a Barmecide feast in some of the cool marble courts, hung with a hundred lamps, and ringing to the tambour, either, and belled ankles of the *Awalim*. Such evenings are rare now, and most of the finest houses are shut or part let at almost nominal rents. Not long ago yearly occupation of a many-roomed mansion with terraced roof, tessellated pavements, sculptured walls, and frescoed ceilings was offered for the not extravagant sum of six pounds. When we think of what such a house would fetch at home, we can realize in some degree the straits of the Damascenes.

Between the failure of the Government to meet the fatal Sirghiz bonds—to take up which men sold the clothes from their backs—the late war, and the opening of the Suez Canal, which has diverted the route of two-thirds of the Hadj, Damascus has been half ruined. The combined result is a quick decay and a paralysis of commerce from which it is doubtful if the community will escape. A helping cause is the limited knowledge of capitalists, who have no idea of other channels for their enterprise beyond those down which their neighbour's money and their own has run away. Because speculation is dangerous for the time being in Ottoman bonds and lands, they rather permit their capital to be idle than invest it in Europe. As money only can breed money this readiness to pinch and even to conceal any that may be in hand leads to an increasing scarcity which presses hardly on all, and most on men of fixed incomes and professions. By fixed incomes we mean those which are fixed on paper at a sum which is rarely received in its entirety. The class who enjoy this imaginary rental are Government functionaries and pensioners, and the new forced capitation loan may be expected to extinguish finally many of their struggling existences. For the few professional men, especially Europeans in Damascus, the case is more painful still. At this moment doctors receive fees in medjidehs for difficult operations, for which twice the number of sovereigns would elsewhere be considered very moderate. We believe the most flourishing medical practitioner to be a native who keeps a pharmacy and dispenses advice and drugs six or seven hours a day at a uniform charge of five francs.

The question which naturally rises is—Can no remedy be found for such a situation? Several present themselves, but their application is easier on paper than in reality. The first necessary step is a rigorous application high and low of that reform for which the whole Empire is crying out—reform in the codes, reform in the courts, reform in taxation, and reform in land tenure. After this we should see with pleasure some free and cheap communication by road or rail with the interior and with the outer world. The isolation of Damascus is wasting her away, and the growing activity of the coast towns proves that even Turkish misrule cannot crush the commercial capabilities of Syria. Let Damascus share some of their ordinary advantages and her own natural ones will do the rest for her. But first we must thoroughly purge the tribunals from underpaid officials whose hands are always open for the bribe, from false witnesses who are bought for piastres, and from all the concomitants of Turkish justice so well known to us by Consular reports and by newspaper correspondence. Although the divergence of the main body of the Hadj is of serious import, we do not think

that this alone could suffice to destroy the city which has existed since the days of the Book of Genesis. The other causes are temporary, and if due encouragement were held out to the Damascenes, and their eyes opened to their own advantage, we are inclined to believe that the crisis might be tided over. We have only to look at the strides made by Cairo in the last two years to learn the effects of improved administration. Add to this cheap and easy communication with the rest of mankind, and we could still prophesy some good days to come for Damascus.

#### THE INCONVENIENCES OF ABDUCTION.

IT has been held by pious journalists that Providence always supplies some subject of public or private interest for discussion in the month of September. The Peage murder, the accident to the steamer *Princess Alice*, the unexpected disasters at Candahar last year, are notable as instances of the forethought of the sweet little cherub who sits up aloft and looks after Newspaper Jack. This year a greater matter has just prevented, and may possibly turn out not to have prevented, the Rev. H. B. Kennard from being the chosen instrument of Providence in discharging this particular part of its functions. It is true Mr. Kennard's mishap was not what the composers of placards love to call a Tragedy. But, if it was not a tragedy, it could fairly come under the other word most beloved of them—it was a Mystery. A great determination of Special Correspondents to Woodford and to 41 Hunter Street took place, and the intelligent reporter seems to have interviewed everybody that possibly could be interviewed. The frankness and communicative disposition of the reverend gentleman principally concerned seems to have saved these inquirers a good deal of trouble. Indeed the graphic nature of Mr. Kennard's "statement," and its abundance of small details, must have made some of his interviewers—though we are wrong here, for he has "left for a further destination, kept secret," and cannot have been personally interrogated—envy and admire him. How he was sitting in his private sitting-room, like the hero or heroine of more than one old ballad, when men of evil intent came to summon him; how he postponed his dinner (always a very unwise thing to do, and only excusable on the score of the natural "flustration" of mind in a man just going to be married); how he went through a painful process of alternately shouting for assistance and being throttled and gagged—the latter not literally, it would appear—all these things appear in his statement, and have been published in the book of the chronicles of daily journalism over and over again. That the inmates of his involuntary lodgings should have thought it quite simple that a mad gentleman should be lodged among them is nothing novel, though it is disquieting to weak nerves. There is a proposition which is too stale for the satirist, but which is solid matter for the social and moral historian of the British people, and that is that a person drowning in two feet of water, a wife in process of jellification at the hands of her husband, and an alleged lunatic under any treatment whatever, are *topus*, and not to be interfered with by any profane outsider. The incidents of the reverend gentleman's incarceration are not very novel either. The heroines of the last century, who were invariably abducted once, if not oftener, in the course of each novel, had special reasons for being shy of the food offered them, which was always of the most costly character. Mr. Kennard, on the other hand, seems to have taken his food freely and to have been fairly well satisfied with it. Bread and cheese and beer seem a meagre compensation to a man defrauded of his dinner; but there might be worse breakfasts than "a nicely cooked mutton chop." Next to the great food question the chief object of anxiety with all abductees (if the word be legitimate) is to try whether their gaolers are corruptible. Fortunately for Mr. Kennard he was—as, indeed, a man usually is on the eve of his wedding tour—well provided with portable property, and he used it with skill and discretion. Five-pound notes judiciously administered are excellent pick-locks; and one of the malefactors, the author of the remark that "money was always a consideration," was either a philosopher or a close student of Dickens, who would have been delighted with him. As a clergyman of the Church of England, Mr. Kennard doubtless had the Danae history in his mind, and applied its lessons exactly as Jupiter would have done if his object had been to get out of the tower and not to obtain admission to it. Classical culture never goes wrong, and the five-pound notes prevailed.

All this being derived from Mr. Kennard's own statement to the police is, of course, legitimate public property. But "Our Own Reporter" would have felt himself disgraced if he had neglected the task of adding private and personal scholia to the text. His energetic inquiries at Woodford and at Hunter Street have resulted in the public being informed of particulars of which it is difficult to exaggerate the interest and impossible to deny the value. One of the Hunter Street revelations is so delightfully characteristic of the average landlady that we can half forgive its publication. "Everything," said the injured woman in question, "that had been asked for in the way of refreshments was supplied." It will be observed that this is corroborated by Mr. Kennard himself, who even pays a handsome compliment to the chops—and it is not every chop which deserves such a compliment; but if you have every refreshment supplied which you ask for, what more can you want? At least such appears to be the argument of this involuntary keeper of a private Bastille, who is, let

us hasten to repeat, a decidedly injured person, and who would probably be very glad if the enterprising kidnappers who have made her house notorious were soundly punished. But there are plenty of other details with which we must confess that we are old-fashioned enough to think that the public has absolutely nothing to do. Mr. Kennard, we are told, has a brother-in-law at Woodford of good position, Manager of Truman, Hanbury, and Buxton's brewery. It is not understood that there is any charge against this brother-in-law, and what business, therefore, we should like to know, have newspaper readers with his occupation and position, and so forth? In order to take part in the wedding, Canon Duckworth slept at the Castle Hotel on Tuesday night. It is really remarkable that we are not told what the Canon had for dinner and breakfast. "The most complete arrangements had been made for the occasion" at the bride's house, and "a large marquee had been erected in the grounds for the wedding breakfast." Clearly the importance of this marquee in furthering the ends of justice is something phenomenal, almost equalling the celebrated chops and tomato-sauce. When Mr. Kennard explained his adventures to the Rector of Woodford, the Rector "deeply sympathized" with him, which speaks well for the Rector's heart (always supposing that he was not quoting the Walrus, in a famous and beautiful ballad), but does not appear to be of great importance to the public. That "the further destination of the bride and bridegroom has been kept secret" must be a blow to the gentlemen of the press, and we should not be surprised to hear that some energetic and devoted man had followed their cab, taken a ticket in the same train, and is now keeping his guardian eye and his observant notebook open in respect of their doings. Meanwhile his brethren have fallen back on Mr. Kennard's past. That he is a well-known breeder of cattle is of course again legitimate enough information, because it is *publica materia* already. But we really do not want to know that Mr. Kennard was married thirty years ago (name of lady given), or that he had seven or eight children (this is a vagueness unworthy of the reporter—we ought to have had exact names and ages). Still less do we see the necessity of informing the world that he was engaged to a young lady two years ago, but that the young lady (name and residence given) was drowned while skating. It is just possible—people are such fools—that this young lady has relations who may not exactly like their dead sister's name to be dragged into a penny-dreadful mystery, and whose sorrow—for the fools just referred to do actually sometimes grieve for their friends even at the enormous interval of two years—may be somewhat rudely renewed. But the reporter is quite impartial. Dead or living, it is all the same to him. It is asserted, he tells us, that certain relatives "desired to prevent the marriage on account of disparity of age between the parties, the bride being represented as a mere girl." But this, says he in his omniscient fashion, is evidently erroneous; Miss So-and-so is not a mere girl; he knows her age to a few years; she is from thirty-seven to forty—which is also a fact of great public interest. The reporter thinks it still "uncertain whether legal proceedings will be taken, the prevalent impression being [that is, the reporter thinking in his own miserable soul] that some family secret, which it is desirable should not be made public, is at the bottom of this remarkable affair." Thus far the reporter—probably under the influence of ill-temper at not being allowed to accompany Mr. and Mrs. Kennard on their wedding tour.

We need hardly say that we know nothing and care nothing about Mr. Kennard and his circumstances. The matter having been communicated to the police because, of course, so far public property, and, if it ever comes into a court of law, it will become public property still further. But it would become so, and has become so, only as far as matters authoritatively and officially divulged extend; and all this backstairs tittle-tattle about the age of the present Mrs. Kennard, and the fate of Mr. Kennard's previous betrothed, and the marquee in the grounds, and the deep sympathy of the Rector, and Canon Duckworth's bed at the Castle, and all the rest of it, is simply a fresh instance of the degradation of public taste and the public press. As for the reporter's precious "prevalent impression," and his insinuation that there is some unsavoury family secret, that goes a little further still. If Mr. Kennard is a man of reading, he might repeat the words of a delightful brother of his cloth to a certain Mr. Favesdrop whose spiritual son our reporter is—"Sir, you have dished me up like a savoury omelette to gratify the appetite of the reading rabble for gossip." The reply would probably be that the reading rabble and the reporter himself would have much preferred that the omelette should be unsavoury, and, indeed, the cook has, as we have seen, done his best to convey a flavour of this kind, if only in hypothetical fashion. But, savoury or unsavoury, the whole thing is simply gossip. There are points of public importance involved, of course. The case is an additional illustration of the terrible ease with which the Lunacy Laws can still be made to cover the worst designs, and if Mr. Kennard's statements about the policemen to whom he appealed in vain be confirmed, there is certainly something for Sir Edmund Henderson to do in the intervals of drilling his men and teaching them how to fill up Reports. But both these things can be investigated and remedied without inquiring into the history, ages, and fates of all the young ladies whom Mr. Kennard ever loved, and the arrangements of the wedding breakfast, and the occupation of the victim's brothers-in-law, still more without announcing "prevalent impressions" as to a skeleton in the cup-

board. The fact of the outrage, and the best means of making such outrages more difficult in future, are the matters, and the only matters, of public interest. All the rest is simply a vulgar incursion into the region of private life, deriving its sole interest from the fact that it is such an incursion. That there will always be a demand for rubbish and garbage of this sort is indeed certain; but respectable newspapers, at least, are not bound to comply with the demand. Perhaps the worst effect of the notorious excesses in this direction which have disgraced journalism in England for the last decade is that competition urges the more respectable papers to follow, if only timidly and at a distance, on the trail of the "Society" nuisances.

#### FREEMASONRY.

**A**SIAM sometimes acquires a sort of prescriptive respectability which makes it almost criminal to attempt to throw any light upon its real origin, or to expose its unfounded pretensions. Freemasonry, though not exactly a sham in the full sense of the word, is regarded by the uninitiated as a most ancient and mysterious institution, preserving the traditions of the illuminati from unknown antiquity, the members of which are able to recognize each other by signs never yet divulged to the outer world, and are strong to punish any traitorous brother who should dare to reveal one jot or tittle of the mysteries. These pretensions are sedulously cultivated by Freemasons themselves, and we find persons in all ranks of life, who in other matters are most punctilious with regard to the truth, solemnly countenancing and perpetuating what appears to the investigator from the outside a gigantic and somewhat puerile sham. Almost every Mason, when asked whether the works published upon the subject purporting to give an account of the secrets are correct in their descriptions of the system, will unhesitatingly answer that they are not, but that Freemasonry contains far deeper, and, indeed, ineffable mysteries. Yet, if any one would take the trouble to look over the catalogue of any large library, he would be surprised at the immense list of books which claim to contain full and complete revelations of the mystery of Freemasonry, to say nothing of the authorized text-books for the use of officers and novices which are published by the Masonic Societies themselves. These last are, it is true, rendered unintelligible by the occurrence of frequent blanks, dashes, and asterisks; but the less legitimate publications supply the omissions in what, it must be confessed, is a very consistent and unanimous manner. According to these treatises, the whole mystery consists in teaching the candidate certain signs and passwords by which he may recognize a brother Mason, and telling him a story (really a clumsy fable, based on the Biblical narrative of the building of Solomon's Temple) to account for them. This story is practically illustrated on the person of the candidate, who at one stage of the ceremony is blindfolded and suddenly thrown upon his back in an undignified manner, and, on being restored to the light, is confronted with skull and crossbones and other emblems of mortality. The red-hot poker of popular fancy is not, so far as we know, used in the initiatory ceremony; but the indignities to which the candidate has apparently to submit seem scarcely less foolish and unpleasant than a mild application of the actual cautery would be. It is not our intention to give in detail all these signs, passwords, and wonderful histories, since any one who is curious upon the subject may take up the *Text-Book of Freemasonry*, *Carlile's Manual*, or any other similar book and learn them for himself. Such fables and ceremonies are harmless enough in themselves, but it is really to be regretted that the members of the order have allowed such false notions to prevail with regard to their genuineness and antiquity. These claims are, however, at once demolished when the light of history and common sense is thrown upon them.

A favourite legend with the craft is that Masonic emblems are found on ancient monuments, and that Masonic signs are in use amongst Oriental and savage peoples. The first statement is so far true that the inventors of the ritual have borrowed a few ancient emblems, such as the Pentalpha or Solomon's Seal; but they have employed them without the least reference to their primitive signification. The second proposition may be disposed of by stating that certain natural signs of courtesy and recognition in common use in the East are employed or imitated in quite a different sense by Freemasonry. For instance, the respectful raising of the hand to the breast, lips, and head, in token of complete devotion, with which an Arab greets a superior, might easily be confounded by a casual observer with the gestures by which a Mason alludes to the terms of the preposterous oaths which have been administered to him, and whereby he consents to have his throat cut and many other disgusting operations performed upon him should he ever reveal the "secrets" entrusted to his care.

Another popular error respecting the craft is that its "secrets" and ceremonial are somehow connected with the ancient mysteries of Egypt and Greece. There is not the slightest foundation for such a supposition; for although all secret societies are so far alike that they have their forms of initiation, degrees, signs, and password, there can be no possible point of contact between the secretly taught science and religion of the ancient world and the essentially modern cock-and-bull story about Solomon's Temple which forms the motive for the Masonic ritual. The claims which have been advanced for it, that it was in some way connected through the Crusades with the Knights Templars and other secret

orders, are also without any foundation, the known history of the craft being totally opposed to any such idea. The Knights Templars were undoubtedly connected with the Assassins, and through them with some of the older secret orders of the East; but their story, though most interesting, and one which deserves careful re-writing, has no more to do with the constitution of Freemasonry than it has with that of the "Good Templars" of Temperance notoriety. Enthusiastic Masons love also to dilate upon the various legends which point to the widely-spread existence and influence of the order. One very favourite anecdote to this purpose is that of a French officer during the War of Independence in America, who, having been captured by Indians, was tied to a stake and about to suffer the usual horrible tortures. In his despair he raised his hands to make the Masonic sign of distress, and called upon "the widow's son," when to his delight and astonishment a young Indian chief stepped forward, responded to the sign, and set the prisoner free. It is only fair to say that the story has been proved to be circumstantially true; but, as the investigation of its authenticity also brought to light the fact that the Indian chief had, during a previous visit to Europe, been initiated in a London lodge, the incident does not go far to prove the antiquity of Freemasonry. In fact, it may as well be understood, once for all, that no Masonic fraternity or Society whatever exists, or ever has existed, in any part of the globe, which does not owe its immediate origin to a European lodge.

The secret of Freemasonry is a *secret de Polichinelle*, and is to be read in fifty different treatises, any one of which will enable a reader to make his way into a lodge quite as well as though he had submitted to the inane ceremonies of probation and initiation. If this is not the case, the Society should authoritatively deny its truth, or it will continue to be under the imputation of having for a great number of years made a great fuss about nothing at all. But in the matter of the antiquity of the order no disclaimers which they could make would be of any avail. The story of Hiram Abiff, and of the mysterious pillars Jachin and Boaz which stood at the Temple entrance, as told by Masonic ritual, bear the unmistakable "Brummagem" brand, and will not for a moment bear the test of criticism, either from an archaeological or Oriental point of view. The real origin of the order as we have it now appears to date from about the beginning of the eighteenth century, while an extinct organization which furnished the motive for Freemasonry, though having no immediate connexion with it, is some three or four centuries older. It has been indisputably proved that the institution of Freemasons took its rise in the guild of operative masons which, under the name of the "Fraternity of Masons," was formed by the architect and workmen employed from the thirteenth to the fourteenth century in the building of Strasburg Cathedral. The flower and pick of the profession were engaged upon this masterly edifice, and they were naturally desirous of perpetuating the secret of such good work, just as the *Comédie Française* preserve the traditions of the art of perfect acting. Their example was followed by other groups of masons throughout Germany, and all these different lodges were, some twenty years after the completion of the tower of Strasburg, merged into one association. Their Act of Uniformity was drawn up in 1459, and ratified by the Emperor Maximilian thirty years later by an Imperial diploma. They adopted the instruments of the craft—the square, level, and compasses—as their emblems, and had a secret password, "Liberty," which in itself gives a clue to the ulterior aims of the Society. The Fraternity of Masons lasted until 1707, when it was authoritatively abolished by the Imperial Diet.

These are the simple facts about the origin of the Society, or rather of the Society whose constitution served as a model for the more recent and spurious association which has taken its name. It is not necessary to enter into the question of the so-called higher degrees in Masonry, such as the Knights Templars, Rosicrucians, and the like. Their rituals are even more impudent pretences than those of the craft itself, and exhibit a mixture of arrant nonsense, child's-play, and profanity which is rather shocking than ridiculous. Amongst the edifying ceremonies which accompany the initiation of the "Knights" are parodies of the Holy Sacrament and other solemn services of the Church. Craft Masonry is at least free from the charge of blasphemy, however much it sins in the way of foolish and unwarranted assumption. Some visionary scheme for the formation of a Universal Brotherhood of Mankind, which should emancipate the world from the tyranny of priestcraft and despotism, was no doubt the idea which actuated the founders of the Masonic order, and which made the organization of the then existing guild of operative masons a ready instrument to their hands. The possible political importance, too, of such an institution as offering a ready vehicle for international conspiracies had much to do with the original success of the movement. But the more widely spread the order has become, the more harmless have been its aims, and the denunciations of popes and kings have only had the effect of giving to a number of benevolent gentlemen the fearful joy of half persuading themselves that they are conspirators of a very formidable kind. As a matter of fact, Freemasonry is an excellent Friendly Society, established for charitable and convivial purposes, and possessing a widely-extended and excellent organization, while its so-called ritual, if spurious, is at any rate irreproachable on the score of morality. If the members of the craft choose to meet together in groups from time to time for the performance of a solemn farce, or delight to deck themselves out in fantastic gear, we have no

more right to find fault with them than we have to grudge the Foresters their processions, scarves, bandit-hats, and other paraphernalia at a Crystal Palace fête. The two orders are exactly on a par, with the exception that the Masonic one is the older of the two. It would be more dignified, no doubt, to give up the nonsense and rely upon the intrinsic merits and real objects of the order, but mystery, even when it is such an open secret as Masonry, has its attractions, and probably does conduce towards holding the Society together. When, however, Freemasons lay claim to an antiquity and an Oriental origin which are absolutely delusive, and when they deliberately seek to impose the sham upon the credulity of the public, it becomes a duty to expose the real nature of their pretensions. Masonry is, as we have said, a very excellent Friendly Society, and very widely spread over Europe, and, indeed, wherever Europeans have settled; but it is essentially a European institution, has no claim to a remote antiquity, and has not the slightest immediate connexion with the East or the least pretensions to antiquity.

#### THE ELECTRICAL EXHIBITION AT PARIS.

ALTHOUGH some few late exhibits are still arriving, yet the Exhibition may now be said to be practically complete. As might be expected, the greatest display is made by the modern apparatus for the practical application of electricity to commercial purposes—above all, by the different systems of electric light. Whilst fully acknowledging the fact that this Exhibition is one of the most interesting and successful that have ever been held, we cannot help observing that the supposed power of the French nation for organization and classification has failed signally in this instance; for the exhibits are so scattered, so imperfectly attended, and so catalogued that few people except those intimately connected with electrical matters, and having the advantage of personal acquaintances amongst the commissioners and exhibitors, could hope to get much information from the Exhibition. No doubt some of the fault lies with the exhibitors themselves and with the foreign Commissioners; but the French Government is to blame, and it alone, for allowing the Exhibition to be so badly catalogued, and, above all, for granting the concession for printing and selling the catalogue to a private speculator, who has added to it under the cover of the title "*Catalogue général officiel*" and the heading of the title-page, "*Ministère des Postes et des Télégraphes*," some most shameless pulls of some of the exhibits, one in particular being repeated several times under different forms. Imagine an official catalogue, published under the authority of a Minister of State, containing such a statement as this, a statement made before the jury have even been appointed:—"L'Exposition d'Edison est certainement la plus importante, la plus nombreuse, et la plus variée de tout le Palais de l'Industrie"; and again, in the face of the widespread knowledge of the true history of incandescent lighting, this official Ministerial catalogue going on to say:—"Edison est le premier qui ait fait usage, et ses brevets en font foi, d'un filament de charbon incandescent continu, avec une résistance supérieure à dix ohms, dans un vide maintenu par un globe de verre continu, dans lequel on scelle les conducteurs métalliques."

Another point on which both the scientific and the commercial world have good cause to blame the French Government is the delay in appointing the members of the jury. The Exhibition has been open since the early part of August, and yet it will probably be some days before the jury are able to begin their work, although the Exhibition is to close (according to the official notice) on November 15. Now in the important class of electric lights, if the award of the jury is to be worth anything, the most careful and accurate measurements will have to be made. Take any one system—in order to judge of the light, after considering its steadiness and photometric value, the resistance of the lamp when burning, and the current required to work it, ought also to be measured. And in the case of the dynamo or magneto machines employed to generate the currents for the lamps, it is necessary to measure the horse-power absorbed by each machine, and also its electromotive force, together with the current which it produces, in order to test their relative economy. Now all these measurements will take time; the more so as the methods of making them, with the enormous currents and high electro-motive forces of most of the lighting machines, are by no means thoroughly worked out, and have not yet passed into mechanical routine, as have the measurements of ordinary telegraphic currents. It is to be feared that, pressed for time, the jury may content themselves with taking the light and dynamo together, and merely measuring in each system the horse-power required to obtain a given candle power—a test which will no doubt give valuable information for commercial purposes, but which will do nothing to help on invention, as the more thorough and scientific method might have done. Another difficulty stares them in the face. In judging the three forms of purely incandescent lamps shown in this Exhibition—Swan's, Maxim's, Leno Fox's, and Edison's—the length of time that the lamps last is a most important element. Now we believe that some of Mr. Swan's lamps have lasted for several months; so either the jury must leave out the question of the life of the burners, or they must induce the competitors to go to the expense of keeping their lamps going until they break down, perhaps for months after the closing of the Exhibition, and delay

their award in this class until the question which lamp will last the longest is settled. Though this method would be very satisfactory to the public, we fear that it is far too costly and cumbersome to have any chance of being adopted. As against these shortcomings, we must set the excellent plan of having lectures given at intervals by eminent electricians on certain classes of exhibits, which are pointed out to the audience by the lecturer, who goes round the Exhibition with them after the lecture for that purpose.

For the Congress in connexion with the Exhibition, we certainly owe a debt of gratitude to the French Government. The work is now practically finished, although the meetings arranged for Tuesday were given up as a mark of respect to the memory of the late President Garfield. The most important question before the Congress, that of settling the international standards for electrical measurement, has been disposed of, with the result that the British Association units, or "B.A. units," have been adopted; the party desiring to adopt the centimetre gram second, or C.G.S. units, of electromotive force and current having given way, whilst a useful concession has been made to the German party, who supported the Siemens unit of resistance, by defining the length and section of a column of mercury which at a given temperature will have the resistance of one ohm—the British Association unit of resistance.

In the Exhibition itself the sight by night is most wonderful. The whole area of the main hall of the Palais de l'Industrie being lighted by enormous numbers of brilliant arc lights, the entire space is flooded with dazzling white light, the crowd moving through it hardly casting any shadow since the rays cross each other in every conceivable direction. Of course, no measurements having been taken, it is impossible to form any guess at the economy of the different systems of arc light as compared one with another; we can only judge of their brilliancy and steadiness. As to brilliancy there is but little to choose between the different systems; but for steadiness the Siemens, Brush, and Crompton systems are quite the best, with, perhaps, a slight superiority in Mr. Crompton's lamp. In fact, we believe that all that mechanism can do to produce steadiness in the electric arc has been done, though no doubt the machinery employed will be simplified, and that the question of getting a perfectly steady arc light is now one entirely for the manufacturers of the carbon-rods. In the upstairs galleries are some few arc lights, one of the best being that of the système Collin, which is fitted up with glass globes, the upper parts of which are built up of prisms, after the manner of a light-house lens.

In the Belgian section, Jaspar of Liège shows a very good arc light, which is mounted after the principle first used by the Siemens, the light being hidden from the eye and caused to illuminate a white canvas disc several feet in diameter, which thus becomes the source of light for the room. The effect is very agreeable, but the arrangement shown appears to be extravagant in cost, on account of the great loss of light. M. Jamin's system must be classed amongst the arc lights. His lamp consists of two parallel rods of carbon placed between the arms of a long horseshoe magnet, which repels the voltaic arc, and thus keeps it always at the end of the carbons. The idea is ingenious, but the performance of the lamp is far from good, the light being one of the least steady exhibited. Amongst the semi-incandescent lights—that is to say, lamps in which the light is given partly by the voltaic arc and partly by the glow of some body heated by the arc—the Jablockhoff system quite holds its own for brilliancy, although it is surpassed in steadiness by the Lampe Soleil, which consists of two rods of carbon, which press by their own weight on a block of hard marble. This system gives a very soft but bright light, and is quite steady. The inventor asserts that the marble block will last about forty hours, and that the carbons only consume at the rate of one centimetre per hour. The Joel light, which is well known in England, is another semi-incandescent light, but it does not contrast well with the other lamps of the same type, for, though steady, it gives but little light, whilst the Werdermann system, though brilliant, is quite as unsteady as the worst arc light to be seen in the Exhibition. Coming now to the pure incandescent lights, we find but little to choose between them as far as effect goes. We have not had an opportunity of seeing the Maxim light, which we have already mentioned; and Swan's, Edison's, and Lane Fox's lamps are almost identical as far as the light-producing part is concerned. Mr. Edison does not appear to make his lamps quite so hot, and, therefore, so luminous, as Mr. Swan does; and Mr. Lane Fox is almost as cautious. But, on the whole, we must say that the incandescent systems are amongst the most interesting in the Exhibition, and we believe that if the financial managers of the Lighting Companies are only energetic, and also moderate in their prices, no very long time will elapse before all large dwelling-houses and hotels will be able to use this beautiful form of lighting. No one, we think, who could afford to light his house with candles or lamps would hesitate to adopt one of these systems, if he were to see the beautiful effect of the hundreds of Swan lamps which are arranged in festoons round the walls of the Salle des Conférences, in which the Electrical Congress holds its meetings. These lamps are worked by an alternating current Siemens machine, which, by its low resistance, is almost self-regulating, the lamps being arranged in parallel arc in series of about ten in each derived circuit. Mr. Lane Fox's lamps are supplied by a Brush machine, for which a very ingenious current regulator is exhibited, consisting of a resistance formed

of loose plates of carbon, inserted as a shunt in the circuit of the field magnets; these carbon plates can be pressed together by the armature of an electro-magnet, the coils of which form part of the line circuit, the result being that if the current through the lamps grows too strong, the magnet attracts the armature more strongly, thus pressing the carbon plates closer together. This lowers their resistance, and causes them to cut out more of the current which excites the field-magnets, and so reduce their inducing power, and diminish the line current. Mr. Swan exhibits some of his lamps worked by the Faure battery; these are used to light the exhibit of the English Post Office. This is interesting scientifically, but is of no commercial importance at present, the prices charged for elements of the Faure battery by the Société de Force et Lumière, the owners of the patent, being practically prohibitory.

#### ANCIENT EGYPTIAN PEDIGREES.

IN a well-known passage Herodotus speaks of the importance of pedigrees among the Egyptians of his time. He visited Egypt in the very last days of its independence. The last dynasty of native Pharaohs was about to expire. The Persians and the Greeks were hovering on the horizon. The old kingdom had often been attacked, often preyed upon; now it was to be slain and devoured bodily. In a period of decrepitude old glories are fondly remembered. The priests of Thebes who boasted to him of their ancient descent had soon little else to boast of, and when three centuries more had elapsed—a short period compared with the millenniums that had gone before—Lathyrus destroyed the very temple itself over their heads. Herodotus is more than usually quaint in this anecdote. He prefaces it by a statement as to the priests of Hephæstus—that is, of course, Ptah, the god of Memphis. According to them, he says, three hundred and forty-one generations had elapsed from the time of the first king to the time of the priest of Ptah of that date, an equal number both of kings and of priests having held office. He goes on to argue that three hundred generations requiring 10,000 years, and forty-one generations 1340 years, this assertion went to prove that no god had been born during all that time, but only men. He next speaks of the priests of Thebes, and of what they told Hecateus the chronicler. For Hecateus, apparently, Herodotus did not feel any very great reverence. "He talked of his own pedigree, and traced his lineage to a god, sixteen generations back." This was not to the priests of Memphis, but to those of Thebes, most probably in the temple of Karnac. Herodotus also visited Thebes, and conversed on this subject with its priests, "but I did not talk of my own pedigree," he explains. The priests of "Zeus," or Amen Ra, went a little beyond those of Memphis, for they boasted of three hundred and forty-five generations, consisting each of a Piromis, the son of a Piromis. This name, he goes on to explain, answered to the Greek *καλὸς κἀγαθὸς*—in short, gentleman. To each a huge wooden colossus had been erected in the temple. "Thus, then," he adds, "they showed that all these men who had statues were of this sort, that is to say, men, and something very different from gods." There had been gods ruling in Egypt, but it was long before; and the last of them was Horus, the son of Osiris, whom the Greeks called Apollo.

It is curious to observe of this passage that modern research enables us to correct or to supersede it. Assuming that Hecateus and Herodotus were really told such tales by the priests of Ptah at Mennofer, and the priests of Noom at Tape, we must charge them with very unscrupulous practice on the credulity of strangers. But the repetition and interpretation of the word "Piromis" betrays the fact that their dragoman was either himself as ignorant and as confident as the majority of dragomans are to this day, or else that he very much and purposely exaggerated the statements of the priests. "Rome," or a word very like it, meant in the "Gypt" language "man"; "Po Rome" is "the man," as contradistinguished from "Po Neter," "the God." If he lied about Piromis he may not have scrupled to lie also about the three hundred and forty-five generations. The fact remains that the priests of Thebes kept their genealogies, and, had we nothing else to go upon but this anecdote of Herodotus, it would be sufficient evidence as to the point. We have fortunately much more definite and detailed information, and that, too, about a period several centuries before the visit of Herodotus. Under Psamthik I., whom the Greeks called Psammotichus, a certain Ra-uh-het, surnamed "the beloved of Ptah," or *Ptah-mi*, was priest of Ptah at Memphis. Mr. Lieblein, a learned Norwegian, has been at the pains of tracing his descent from a priest whose name he gives as A-aa; but it may be perhaps better transliterated Ya. Mr. Lieblein founds important chronological arguments upon this and similar pedigrees; but we are not now concerned with them. Ya was priest of Ptah in the reign of Rameses II., and sixteen generations later his descendant, Ra-uh-het, occupied the same dignified position. It is clear that if the priesthood was not exactly hereditary, it yet had a tendency to remain in a single family, and so far Herodotus is right, although Sir Gardiner Wilkinson and others have been mistaken in speaking of a priestly or any other caste. There were no castes in the Indian sense in ancient Egypt at any period. The sixteen generations of the family of Ptah-mi at the computation of Herodotus would require nearly five centuries, a short time, indeed, in Egyptian history, but which takes the

family back almost to the beginning of the then subsisting order of things. *Rameses I.*, the grandfather of *Rameses II.*, had established a new monarchy, and from him to *Psamthik* there is no break in the continuity of the history. Five hundred years would take us back in the England of to-day as far as the end of the reign of *Richard II.* Few grand functionaries of State hold now the offices their ancestors held then. *Mr. Lieblein* has made another pedigree which comprises no fewer than twenty-two generations of royal architects, extending from the accession of the twenty-second dynasty to the year *B.C.* 500.

An interesting example of the importance of pedigrees to the historian is afforded in the paper by *M. Maspero*, read at the recent Oriental Congress. It relates to the wonderful discovery made by *Herr Brugsch* in the Theban mountain. We described a few weeks ago the main features of this discovery, and need here only advert to the family relationships detailed by *M. Maspero*. They are those of the priests of Thebes, at a time not comparatively so very remote from that of the visit of *Herodotus*. *Shishak*, a thousand years or so *B.C.*, overthrew a dynasty of "priest kings" who had reigned for a few generations in the Thebaid. To this dynasty is attributed the assemblage of the mummies of its regal ancestors in the hiding-place now at length opened; and the records so preserved enable *M. Maspero* to form a table of six generations, from *Hier-Hor*, the priest who first ascended the throne as king, to *Pi-notem III.* The body of *Pi-notem* has not been found, though it is probably owing to his pious care that this royal sepulchre was prepared. He may have died in exile, or perished obscurely amid the troubles which befel his kingdom.

If we go back a little further in Egyptian history to the time of the twelfth dynasty, the family of *Amenemhat* and *Osirtasen*, the so-called middle period, we find genealogies very carefully kept. The twelfth dynasty was succeeded by a period of utter anarchy and the domination of the Hyksos. It was preceded by a similar period and the domination of another foreign race. It is a period of great interest; for, though we cannot date it or give it a place in history with respect to contemporary events elsewhere, its relative position in the long Egyptian succession is fully ascertained. Moreover it was, almost without doubt, under the first king of this family that the oldest building not a tomb of which any fragments have come down to us, the temple of *Heliopolis*, or *On*, was built. It was during the subsequent domination of the Hyksos that *Joseph* came to *On*, and, according to *Dr. Brugsch*, enjoyed the favour of *King Noob*. The settled times of the twelfth dynasty afford more than one example of a detailed genealogy; but the most curious is perhaps that in the celebrated ptolees of *Beni Hassan*. Here are no fewer than thirty-six excavated tombs in the face of a single cliff. The first to the northward is a mere square opening—the grave, perhaps, of the patriarch of the race. His name is unknown; but his successor, *Ameny*, made the second tomb—one of the most beautiful and satisfactory pieces of work of the kind that the world holds. Fifteen hundred or more years later the Greeks discovered independently the merits of the style which *Ameny* had used, and the columns of *Beni Hassan* have sometimes, by a French perversion of nomenclature, been called *proto-Doric*, though, to use another inflated French phrase, *Ameny* looks down through twenty centuries upon *Phidias*. *Ameny* was Governor of *Sah*, and dwelt at *Shoofoo-Menat*, a place which has been usually identified with *Minich*, but which more probably answers to the extensive mounds of *Ashment*, a village not noticed in ordinary books or maps, and much nearer *Beni Hassan*. From *Ameny* as an ancestor was descended a long line of royal architects, Governors of *Sah*. Some eight or nine of the six-and-thirty tombs still preserve their inscriptions, and in each case the family pedigree is traced to *Bakt*, the daughter and heiress of *Ameny*. A somewhat similar pedigree, but not so circumstantially stated, may be found in a series of tombs at *Elkab*, the ancient *Nekheh*, the City of the Sacred Sow.

The descent of the family of the monarchs of *Ashment* from the lady *Bakt* betrays a resemblance, one of many which may be detected, between the usages of this middle period and those of the infinitely more remote and undateable monarchy of the pyramid-builders. Almost everything, except the unchangeable country and its great river, had changed—religion, language, laws, perhaps even race—and there is, as might be expected, a difference as great between the Egypt of *Shoofoo* and that of *Amenemhat* as between the Rome of *Augustus* and that of *Rienzi*. But the remoteness of both the twelfth dynasty and the fourth from our own time is illustrated by the importance given under each to female succession. Under the pyramid-builders there are several examples, some of them of such a nature as to make *M. de Rougé* inquire if the succession of the throne did not go solely by women. It would be very interesting if the question thus suggested could be distinctly answered. We are so far almost in the dark. Remains of a funeral character in plenty have come down to us, and we have long pedigrees of private persons; but few data have yet been discovered which reveal the laws which regulated the descent of the crown. There were two kings in the sixth dynasty whose father is known to have been king before them. Until then the fathers of no kings are named on the monuments; and it would not be safe to argue from the end of the sixth dynasty as to the usages of the third or the fourth. In *Manetho*, however, there is a curious point, hitherto, we believe, unnoticed. He says of the first dynasty, that *Athothes*, the second king, was son of *Menes*, the first, that *Kenkenes* was son of *Athothes*, and so on down to the end of the dynasty. There are, so far, no

means of checking the accuracy of this assertion. But it may be observed, on an attentive examination of the fragments of *Manetho* which survive, that he does not say that any king of the second dynasty was the son of his predecessor; and that he does say of *Binothris*, the third king of this second dynasty, that in his time it was settled by law that women might wield the royal power. This may be a mere coincidence, but it may also throw some light on the question of female succession as put by *M. de Rougé*, and be further, as the most ancient example of the kind in the world, worthy of the attention of the disciples of the lamented *John McLennan*. It is, in fact, remarkable in how many cases, down to very late times, a person places his mother's name on a monument to the exclusion of his father's. Possibly in the early period daughters and mothers enjoyed rights in this respect very different from those which prevail among us. *Seneferoo* was not succeeded by a son. *Shoofoo* was not father to *Chafra*. But there is reason to suppose that *Mertitafa* was wife to both *Seneferoo*, the last king of the third dynasty, and to *Shoofoo*, his successor, the builder of the great pyramid. She survived her two husbands. Is it possible that from her either or both of them derived a claim to the throne? And when, after *Shoofoo's* long reign, *Chafra* succeeded him, was it because he was related to her—because, perhaps, he had married her daughter? It is more than likely, yet the probability does not amount to proof, and we only know that on her tomb she records her friendship for this king also. Such are the materials for a romance of the dawn of history. The name of *Seneferoo* reminds us of the fact that even then a "royal descent" was matter of pride, just as in the days of *Sir Bernard Burke* and *Mr. Joseph Foster*. *Seneferoochaf* accounts for his long name, and records his illustrious ancestry, in an epitaph which may be thus paraphrased or translated:—"The Royal Architect, chief of the house of *Apis*, privy councillor, decorated with the collar, *Seneferoochaf*, the son of *Nefermat*, the son of the illustrious princess *Nesertkano*, daughter of *Seneferoo*, King of Upper and Lower Egypt. Titles, decorations, royal descents, sinecure offices, all seem to have existed in full blow at a period which some historians do not hesitate to place considerably before the Creation of the world according to the common reckoning."

#### IMPROVEMENTS ON SCOTT.

THE world has to lament over a great loss in literature, and to rejoice over a great gain. Six months of *Miss Braddon's* invaluable life have passed without her writing a novel; and an addition to the intellectual wealth of England which under ordinary circumstances might have been looked upon as absolutely certain, is not forthcoming. This is very sad. It is most painful to reflect that the stock of *Braddon* novels must of necessity be less by one than it might have been; but happily there is much to alleviate the shock which may be caused by this painful news. *Miss Braddon* has not been idle—far from it. If she has allowed six months to go by without adding to those original works of genius, of which, happily, there is already such a very large number, it is because she has been busy improving the books of one *Walter Scott* for the million. A considerable portion of this writer's novels are, it seems, unfit for publication—that is, for publication in penny numbers intended for the working classes—so *Miss Braddon* has set to work to remove what is objectionable. For some time past advertisements have appeared respecting this issue of the *Waverley Novels*; but *Miss Braddon* would apparently have been well content to pursue her work in silence, and would not have appeared in public to explain her object in mutilating *Scott's* books, had it not been for the rude and ungentlemanlike observations of a writer in the *Pall Mall Gazette*. This pedantic and unmanly person spoke contemptuously of "*Scott in Pennyworths*," and, after saying some unpleasant things, implied that the publication was a catchpenny enterprise, which in one sense it certainly is. This aroused *Miss Braddon's* wrath, and she turned fiercely on her critic, and vindicated herself in a letter which is likely to afford delectation to many. As was to be expected in the production of a great writer, the conclusion was the most striking part of it. Defending herself indignantly against the charge of seeking to make money by pleasantly arranging *Scott*, *Miss Braddon* said:—"In conclusion, I can only say that, so far from the production of these little books being a catchpenny enterprise, it is a work which never will and never can remunerate me for the labour I have given to it. I have devoted just six months of my life to the preparation of these thirteen stories—exactly the time it took me to write my novel *Flores*; and if my critic had any familiarity with the book trade he would understand the loss involved in this fact." Now this is a very touching and very beautiful passage, and possibly it will survive everything else that *Miss Braddon* has written. Let it be observed, in the first place, how, with the modesty becoming a woman, but at the same time with a recognition of the merit of her own works which is permissible to a great writer, she suggests without definitely stating the immense pecuniary value of one of her books. The ignorant and supercilious critic does not know, she implies, what it is for six months to pass without *Miss Braddon* writing a novel; or what she foregoes and the trade suffers when, at the end of half a year, no masterpiece is ready. Possibly vulgar curiosity may cause a few inquisitive people to regret that *Miss*

Braddon should not have been more definite, and should not have given some idea of how much she and the trade have lost by her abandoning the pen for the scissors; but the regret, though natural, would be a mistaken one. She has rightly abstained from condescending to particulars, and, with the skill of an accomplished author, has left something to the imagination. Those who are not sufficiently imaginative, and who love positive information, must find out a friend who possesses "familiarity with the book trade," and ask what happens when Miss Braddon has not a novel ripe at the end of the usual period, and what is the enormous loss "involved in this fact."

The end of the letter in which this heavy sacrifice is so feelingly referred to is, as we have said, the most remarkable part of it; but the other portions are well worth attention, and are only inferior in interest to the sentence we have quoted. Miss Braddon begins by explaining what it was that first inspired her with the idea of abridging Scott. This was due, it seems, to no less a person than the Archbishop of Canterbury, who, in a speech which was published, deprecated the quality of the literature of amusement provided for the people. What possible connexion there could be between the very just observations of Dr. Tait and the abridgment of Scott by Miss Braddon is not at first sight easy to see; but, so far as we can understand, the process of reasoning which she went through was as follows:—The people have had literature provided for them; they ought to have good literature; Scott's writings are good, but they might be cleverly abridged, so as to enormous them down to penny numbers; for the task of abridging them, no one can be more competent than she, who is flooded with dazzlingly good literature, and pointed to it as proof of her competence. Of course, it is impossible to form a just opinion of his plays as proof of his competence. "Sir, if I was not already acquainted with your works, the high opinion which my father has of them would induce me at once to accept your offer." In like manner the author of *Vivien* has a very high opinion of the works of Miss Braddon, and considers that gifted lady eminently qualified to re-edit Scott. Now Scott was to be re-edited we are carefully informed. After reading the passage in the Archbishop's speech, it immediately occurred to Miss Braddon "that the *Waverley Novels*—for half a century the delight of the educated classes—might be so condensed and simplified as to give equal pleasure to that vast multitude of readers who have neither enough leisure nor enough culture to enjoy the works of a novelist who dearly loved to expatiate into the domain of the antiquarian and the word-painter, and whose style in all its scholarly exuberance is assuredly far above the heads of the million." We fear that Miss Braddon's style, in its exuberance, whether scholarly or not, will fail to be appreciated by most people. Why a writer of historical novels should not make use of his antiquarian knowledge, or, to use Miss Braddon's phrase, should not "expatiate into the domain of the antiquarian," it is passing hard to see. Without antiquarian knowledge an historical novel cannot be properly written; and Miss Braddon might as well talk of the astronomer "expatiating into the domain" of the mathematician. What the domain of the word-painter may be, as apart from that of the novelist, and how far the latter trespasses when he enters the former's territory, are questions concerning which we must admit the most humiliating ignorance. We presume, however, that what Miss Braddon means is that Scott's descriptions might be cut out or shortened, and that those portions of his romances which show antiquarian knowledge might also be struck out to fit his works for "the million." Now the *Waverley Novels* would suffer if the descriptions were omitted, it is not necessary to point out; but perhaps they are sometimes skipped by very idle readers. With regard to the antiquarian portions of Scott's books her proposition seems truly wonderful. No feature, perhaps, in his works commands greater admiration than the marvellous skill with which he made use of his wide antiquarian knowledge, and to shorten his works by suppressing those parts would be like improving Marryat by leaving out every passage which shows a knowledge of seamanship. Miss Braddon expresses a fond hope that those who make their first acquaintance with Scott in what she calls "this simplified form" will afterwards learn to appreciate him "in all his amplitude of thought and detail." We should think certainly that, if anything could give a distaste for Scott's works, it would be the desiccated Scott which she desires to offer. It is only fair to her to say, however, that she puts forward a reason for her singular view. "Many and many a time," she says, "has she heard readers, not without education, avow that they had tried to read Scott, and could not. His opening descriptions were so long, his dialogue was so Scotch. Like Dr. Johnson, the general reader wants to tear the heart out of a book." We fear that in this case it is not the general reader, but the editor who wants to tear the heart out of a book. What Miss Braddon says about her friends' views is doubtless quite correct. Probably, like most of us, she knows a number of people who, though not without education, are extremely silly. If she takes the trouble to inquire, she will probably find out that amongst her acquaintance there are not a few who find Shakespeare and Pope, and even Byron, too much for them. Would this constitute a valid reason for manipulating these writers, so as to reduce them to the level of the meanest capacity? What kind of literary food the working-man may desire we do not pretend to know, but assuredly he is not so poor in these days as to be unable to buy any book which costs more than a penny, and we venture to say that mauling great works in

order to please him is hardly the way to create a healthy taste. It is, however, a waste of time to argue the question seriously.

How Miss Braddon has executed the abridgments which she undertook *de cœur léger*, and with so profound a belief in her own competence for the work, how the novels have fared which she has re-edited at the rate of about one in a fortnight, we shall not attempt now to consider, though we propose to treat the subject at a future time. We view the task with considerable apprehension, and, indeed, Miss Braddon's proceeding is altogether calculated to strike dismay. Our estimate of her powers might not quite accord with her own; but we freely admit that she is as well able to re-edit a classic as an ordinary manager or actor. Now managers or actors have always thought themselves both entitled and qualified to alter and "arrange" Shakespeare as seemed good to them, and few things are more painful in the literary history of this country than the tolerance with which the treatment of the great master has been received by the public and the critics. Is the bad example of the stage to be followed in literature? Are the works of our foremost writers to be mauled and spoilt in order to adapt them to a supposed popular taste, of which the only ascertainable feature is its intense vulgarity? We hope not; but it is impossible not to see that Miss Braddon's example may have its effect, and that where she has so boldly rushed in many may be found to follow. Most sincerely, then, do we trust that she will desist from self-sacrifice. Why should she inflict great pecuniary loss on herself and demerit the book trade by unwonted silence? Under ordinary circumstances we should not, we confess, pray for a continuance of her masterpieces; but, as things are, we devoutly hope that she may soon return to constructive work. Satisfied with having in six months rendered thirteen of the *Waverley Novels* fit for the working-man, let her, for Heaven's sake, resume her place as an original writer and leave Scott in peace.

#### MOUNTED INFANTRY.

THERE is something very terrible in the regularity with which one military question relieves another. Abolition of purchase, short service, army reserve, linked battalions, brigade depôts, exchanges, mobilization, and autumn manoeuvres have all in turn appeared and been disposed of for better or worse. But the cry is, still they come; for, while we have immediately before us Mr. Childers's grand reorganization scheme, behind us, like Black Care, is seated the mounted infantry man. It is certainly suggestive, and possibly appropriate, that the commencement of the silly season should have been selected for the introduction of this nondescript warrior. Not that this is his first appearance; on the contrary, he has already started up in a casual and fitful manner on more than one occasion, but has always been dismissed and pigeonholed owing to the pressure of weightier military matters. His resuscitation has lately taken place in a long letter to the *Times* of the 8th inst., headed "Mounted Infantry." There were doubtless many who perused the above heading with a feeling approaching to relief at finding that we had any infantry to mount; but their delight must have been quickly dispelled by another letter immediately following, signed by a "Field-Officer of over thirty years' standing," which informed us that, in fact, we had none. The writer of the first letter, Mr. Edward Maxwell (Grant), does not, however, urge that we should in reality mount any of our infantry, which, considering their limited numbers, is perhaps fortunate. He flies at higher game, and his letter, when summed up, is nothing more nor less than a proposal that we should disestablish a portion of our field artillery, and turn the greater part of our cavalry into mounted infantry. Mr. Grant opens his letter by stating that—

Having seen three wars fought out by regular troops, I may consistently claim a practical acquaintance with the subject. As I have served with cavalry regiments, I am not open to the charge of want of practical experience with this branch of the service or of being prejudiced against it. The ideas herein set forth may possibly appear rather sweeping to some conservative minds, but they are based upon years of actual experience in warfare, wherein I had special facilities for making impartial observations and conclusions.

It would possibly have strengthened Mr. Grant's case had he informed us what the particular wars were which he had seen fought out, and in what capacity he attended them. Was he a soldier, an officer, a special correspondent, or an attaché? Nevertheless he certainly manages, as we shall see, to deal one or two awkward thrusts at the cavalry and artillery of the present day, and his letter contains matter for serious reflection. He commences by condemning both lance and sabre, the former as being "utterly obsolete," the latter as being "of so little practical use that there are many close and careful students of modern warfare who strongly advocate its banishment from future armaments." The utter uselessness of both in presence of the modern breechloading rifle is pointed out, and the following four propositions are laid down for consideration:—

1. Shall we preserve the existing proportions between the different arms of the service, modifying those corps which may require improvement in drill and armament, and then add a new grand division of mounted infantry?
2. Shall we maintain the existing cavalry and artillery proportions, and teach part of the infantry to ride and fight on horseback if required?
3. Shall we maintain the infantry and cavalry as they stand to-day, and teach and arm the cavalry so that they shall be competent to discharge the duties of mounted infantry?

4. Shall we make a general redistribution of the proportion between the arms of the services, and diminish the corps which the improved weapons have robbed of a portion of their usefulness, and increase proportionately the corps which have proved the most effectual in modern conditions of warfare?

Of the above alternatives, No. 1 is dismissed on the ground that the present cavalry organization is inadequate to the requirements of the present day, and also because no country could furnish the largely increased number of horses that would be required to create a force of mounted infantry. No. 2 is also put out of court, on account of the difficulty attendant on the selection of properly qualified men from among the infantry. A much more valid ground of objection, which does not appear to have occurred to Mr. Grant, would be found in the fact that in these days of short service the infantry have barely time to become proficient in the numerous subjects which now form part of the infantry soldier's training, nor have we any men to spare from our present attenuated establishments. The third proposition, according to Mr. Grant, furnishes the key to the solution of the whole question. He lays stress on the fact that the lance and sabre are both obsolete, and, as evidence on this head, points to the last Russo-Turkish war, in which he says that neither was used more than once or twice. Accordingly he suggests a careful examination of the weapons used by the cavalry of the present day, and, as a natural result, the substitution of the rifle for cold steel. He also points out that, if we turn our cavalry into mounted infantry, we shall start with the advantage that all the men are already trained to ride. Having arrived at this point, Mr. Grant proceeds to give the various duties of cavalry on service under numerous headings, which arrangement we think we can simplify. Some years ago a German writer on tactics, Von Clausewitz, summed up the value of cavalry in modern war in the following terse sentence—"useless on the battle-field, but invaluable off it." Mr. Grant takes much the same view, and maintains that against the other two arms modern cavalry are simply powerless. The statement is somewhat sweeping, but still there are certain grounds for making it. The wars of 1866, 1870, and 1877 are remarkable for not having produced a single decisive blow struck by the arm during a battle, nor a single effectual pursuit of a beaten army after a victory. On the other hand, it might be urged that these wars were also remarkable for not having produced a single cavalry leader of repute, and that it is a well-known and admitted fact that no arm of the service is so dependent for success on the presence of a good leader. To this Mr. Grant would probably reply that the occasion never fails to produce the man, and that, as the occasion has gone for ever, we shall never again see a cavalry leader of the old school like Seydlitz or Murat. Let us pass on to the second sentence of Von Clausewitz's opinion—namely, that cavalry are invaluable off the battle-field. To this Mr. Grant fully assents, and shows that the numerous duties of foraging, scouting, reconnoitring, screening, pursuing, covering retreats, protecting convoys, and making raids, could be far more efficiently performed by men armed with rifles—in fact, mounted infantry. This concludes Mr. Grant's case against the cavalry, and he has certainly given us matter for reflection. Hitherto the establishment of mounted infantry has been advocated by numerous writers as auxiliary and supplementary to cavalry proper, to be used merely as a means of rapidly conveying men armed with rifles to some vital or important point, there to become infantry, and fight as such. But Mr. Grant would have no compromise of this kind. To quote his own words:—

The natural conclusion of the preceding discussion is manifest; the speediest, cheapest, and best plan for providing the mounted infantry of the future will be to change the armament and drill of the existing cavalry regiments into a homogeneous mounted force, which will combine all the useful features of the old cavalry organization with the new duties of the force universally admitted to be a necessity for the armies of the present and future.

Let us now pass on to the artillery. The authority we have already quoted, Von Clausewitz, described this arm as "worse than useless off the battle-field, but invaluable on it." Mr. Grant here differs, and condemns the arm all round:—

The military attacks and war correspondents who watched the operations in the Turkish Empire during the late war are almost unanimous in their opinion that a very large majority of the shots fired by the artillery on both sides were of no use whatever; in fact, with the single exception of the capture of Telieh, on the Sula road, the Russians might just as well have left their artillery at home. . . . The bombardment of Plevna by five hundred Russian and nearly one hundred Roumanian guns made no impression on the Turks. The Turks had Krupp guns, and, although Russian and Turkish ammunition was not of the best quality, this defect was largely made up by their knowing every range to a foot. Making all allowances for inferior guns and ammunition, the late war in Turkey showed conclusively that breech-loading rifles have necessitated very great improvements in artillery, if that branch of the service is to maintain its present standing.

This is a heavy bill of indictment against the arm. Its uselessness, and worse, off the battle-field is notorious and apparent. It is bulky, cumbersome, and complicated. It consumes immense supplies, occupies great space on the line of march, and requires a constant escort from one of the other arms. These defects have as yet been condoned on account of the great services which it has hitherto been supposed to render on the battle-field. Mr. Grant, however, openly and boldly attacks this theory, and denounces the efficacy of the arm in action. He weakens his case by quoting instances in illustration in which he himself admits that the material employed was faulty. Perhaps we can strengthen it. According to the well-known writer on tactics, the late Major

Home, R.E., the percentage of Prussian losses at the battle of Gravelotte was thus divided among the three arms:—By infantry fire, 94 per cent.; by artillery fire, 5 per cent.; by sword, lance, and bayonet, 1 per cent.; and these figures are fairly representative for the whole war. Five per cent. of the total casualties is surely a very small proportion for so costly an arm as the artillery. Nor is there much probability that this proportion will increase, inasmuch as the newly-established field-firing at long ranges by the infantry will cause the artillery to remain further off than ever. Artillery officers would doubtless reply that the function of the arm is rather to batter down and destroy walls, houses, intrenchments, and material obstacles than to kill men—in fact, it prepares the way for the infantry. Mr. Grant denies that it does this, and we should like to quote some opinions on the other side. In conclusion we will quote Mr. Grant's combined attack on the cavalry and artillery, which commends itself to economists at any rate:—

In fact, the assertion was made more than once during that (1877) campaign, that, unless there was a great increase of efficiency in both artillery and cavalry; if two armies were placed face to face with equally good positions and commanders, and all the artillery, with three-fourths of the cavalry, were withdrawn from one army, and their places filled up with all the infantry that could be organized and maintained with the money expended on the abstracted corps, the latter army would annihilate the one maintaining the existing proportions between the various branches of the service.

As we have already stated, these views are bold, not to say startling; but we can only observe that as yet no foreign Power seems likely to adopt them; and as they are more interested in the matter than ourselves, we would prefer to postpone any action for the present.

#### TACTICS OF THE AMERICAN PROTECTIONISTS.

THE rapid reduction of the United States Debt is making the Protectionists of that country uneasy about the permanence of the system to which they are attached. In the last financial year, which ended on the 30th of June, the surplus available for the redemption of debt somewhat exceeded 20 millions sterling, and in the current year the surplus will be still larger. The refunding operation so successfully carried out by Mr. Windom has just reduced the charge of the debt by somewhat more than 3 millions sterling, and the surplus of 20 millions which was yielded last year will also set free interest exceeding three-quarters of a million sterling. Roughly speaking, therefore, there will be, in consequence of the reduction both of the principal and interest of the debt effected in the past year, an addition to the present year's surplus of about 4 millions sterling. Assuming that the expenditure and revenue will be about the same this year as last, there will thus be about 24 millions sterling available for redemption of debt in the current financial year. Were this sum to be applied to the purpose annually, the whole debt of the United States would be extinguished in a little over thirteen years. According to the last monthly statement of the debt by the United States Treasury, the portion of it bearing interest, with which alone we have here to do, did not quite amount to 321 millions sterling. Of course a surplus of 24 millions a year would extinguish the debt much more rapidly; for each year's purchases for the Sinking Fund would increase the sum available for future purchases by the amount of the interest set free by that year's purchases. In other words, the surplus available for redemption of debt would be increased by every act of redemption, provided that there were no remission of taxation. Besides, it is to be borne in mind that last year's expenditure includes about 10 millions sterling for pensions, and these pensions must decrease rapidly every year henceforward. It is now a considerable time since the great Civil War came to an end; and as the policy of the United States is now one of non-intervention, peace, and retrenchment, the additions made to the annual pensions are very small, while the reductions by death must every year largely increase. Supposing, therefore, that the present taxation were kept up, the total extinction of the debt might be looked for in a very few years. Of course the present great prosperity cannot be expected to last for ever, and it will naturally be followed by depression; but, on the other hand, in bad years as well as good the population will grow. By the end of a few years the population of the United States will probably be not far short of 60 millions, and the wealth of the country will grow still more rapidly. An English-speaking population of nearly 60 millions in so vast and fertile a territory, energetic, hard-working, and enterprising, will, as a matter of course, consume much more largely than the present population. Therefore, with the present taxation the yield will be enormously greater, and, as a consequence, so will the surplus. In other words, the extinction of the debt will in reality be more rapid than we have assumed it to be. But with the extinction of the debt the Protectionist system will naturally come to an end. No people, however much they may desire to promote native industry, will keep up a great taxation for that purpose alone. Unless, therefore, the United States depart from their settled policy of non-intervention and peace, it is difficult to avoid the conclusion that with the extinction of the debt must come also the fall of the Protectionist system. The Protectionists see this, and they are laying their plans to prevent such a result.

Of course it is not probable that taxation will be maintained at its present high rate. However anxious the Americans may be to clear off their debt, they will hardly maintain a surplus ranging from twenty-four to perhaps forty millions sterling a year for that purpose alone. It may be expected, therefore, that, now that the total extinction of the debt is so clearly in view, they will set about remitting taxation in earnest. But if Congress is left to itself, it will be likely to select for remission the taxes which press most heavily upon the springs of industry; or, at any rate, if it distributes its favours among the more clamorous and more influential suitors for them, it will no doubt remit customs as well as excise duties. But to remit customs duties would be almost as bad, from the Protectionist point of view, as to extinguish the debt altogether. As the population and wealth of the country grow, the yield of the taxes, as we have just pointed out, will grow also, and therefore every year there will be a considerable amount of taxes to be repealed. Besides, as we know from our own experience, every remission of taxation is followed by such an increase of consumption that the Treasury is very soon recouped for the immediate sacrifice it makes. Supposing, then, that Congress were to decide upon maintaining a surplus of, let us say, 10 or 12 millions sterling annually, and were at once to repeal an equal amount, in the course of a year or two the remaining taxation would become so much more productive that it would be in the power of that body to begin remitting taxes again; and so the result which the Protectionists dread would be reached—a little later, it is true, but still most certainly. They are, therefore, laying their plans for maintaining protection, in spite of the large surpluses which exist.

The plan favoured by them is to remit only what are called "Internal Revenue Taxes"—that is to say, taxes levied within the country itself upon the produce and manufactures of the United States, and to leave intact the whole system of Customs duties. To promote this object they have summoned a great meeting, to be held in New York in November, and they are making strenuous efforts to obtain popular support for their movement. The movement itself originates in Pennsylvania, the great coal and iron State of the Union, which has all along been the mainstay of the Protectionists, but it no doubt will obtain very general and powerful support throughout New England and the Eastern States generally. The older States of the North along the Atlantic seaboard are all of them more or less manufacturing and trading, and are therefore in favour of protection. Nor can it be disputed that the feeling throughout the United States generally is on their side. Americans are all anxious to create a varied industry, so that their country shall be, as they say, "self-sufficing"—that is, shall afford markets within itself for its agricultural produce, and shall not be dependent for any of the great articles of consumption upon foreign nations. Besides, there is a very general opinion that protection increases wages. One of the favourite arguments of the Protectionists is that they desire to keep their own artisans and workpeople from the "starvation wages" of Europe, and that they have succeeded in doing so by maintaining a Protectionist system. Many high authorities, themselves Free-traders, believe that the Americans have really done this—that, as a matter of fact, protection does enhance wages. For ourselves, we cannot agree with this view of the matter. If, as we believe, protection fails to protect, and, in fact, hampers and hinders industry instead of promoting it, it must follow that it tends to lower wages; for whatever prevents the accumulation of wealth must lessen the fund out of which wages are paid, and consequently must tend to lower wages themselves. But, however that may be, the belief is very general in the United States that protection does tend to raise wages, and therefore the working classes generally are in favour of it. It would seem that at any rate the agricultural States of the West and South ought to see that their interest is in preventing the maintenance of protection. Their one great want at present is the extension of railways. The more the West and South are opened up by railways the more quickly will their soil be brought into cultivation, and the more largely will they be able to send the produce to the markets of Europe. But it is clear that protection retards railway construction, since it makes iron and steel artificially dear, and therefore makes more costly the building of railways. Yet the South and West, although they are able, if they unite, to carry whatever measure they please in Congress, do not feel sufficient interest in Free-trade to resist the organized union of Protectionists, and it is probable therefore that for a while the Protectionists will keep their ground. Moreover, it is to be borne in mind that the power of the railways in the United States is enormous, and that, although it is the interest of the new railway Companies to get their rails and their locomotives as cheaply as possible, it is the interest of the older Companies to prevent their newer antagonists from fitting themselves out very much more cheaply than they themselves have been able to do. In the United States it is not necessary to obtain the leave of a Legislature to make a railway, and consequently there is no limit to railway competition except that which is imposed by the difficulty of obtaining traffic. But if new Companies could make their lines more cheaply than the old, a temptation would be offered to extend competition; and thus the old railway Companies are protectionists, although in a different state of things it would be their interest to obtain iron and steel as cheaply as they could.

But even if the Protectionists continue for the present to be as

successful as they hitherto have been, the course of events is against them. It is clear from what we have said above that the tactics of the Protectionists, though they may retard the period when protection must fall for want of an object on which to spend the surplus revenue which it raises, yet cannot prevent that period coming very soon. The whole of the Internal Revenue taxes collected last year were under 40 millions sterling. Even if, therefore, the 20 millions stealing of surplus which existed last year were to be swept away at a stroke, the stimulus thereby given to consumption would soon lead to another surplus so large as would afford occasion for a further remission of taxation, and so on. But, of course, no such sweeping remission is thought of. Another point not to be lost sight of is that, if the Protectionists are successful in this movement, they will really only make the final downfall of their system more injurious to themselves. If they were now to allow a gradual reduction of Customs duties, they would gradually be able to prepare themselves for the competition which awaits them, and probably most of the greater industries would find that they were well able to bear the ordeal. But if the Protectionists prevent this, and maintain the customs duties nearly as high as they are for another period of ten or fifteen years, the rapid extinction of debt will then compel these duties to be swept away wholesale, and will inflict, in consequence, terrible suffering upon all persons engaged in the protected industries. It is the great evil of protection that it diverts capital and labour from the channels into which they would naturally flow into other channels in which they maintain themselves only by virtue of the protection; and therefore, when the protection is withdrawn, the industries perish, capital is wasted, and labour, deprived of the employment to which it has become accustomed, suffers great hardship. Even in the industries which would naturally flourish in a country, protection fosters negligence, routine, and slovenliness, and thereby makes the ordeal of competition much more severe than it otherwise would be. For their own sakes, therefore, it would be much better for the Protectionists if they failed in this agitation, and if the Customs duties were gradually reduced and finally repealed.

#### RECENT RACING.

ONE of the most unpleasant race-meetings hitherto held this year was York August meeting. There was no fault to be found with the management, plenty of money was added to the stakes, the fields were numerically strong, and several horses of note took part in the races; but the pleasures of the meeting were completely spoiled by the almost continuous downpour that made the three days miserable. To be drenched to the skin, to get wet feet and to catch a violent cold, is disagreeable enough; but what backers of horses objected to far more was the complete upset of public form, and the consequent defeat of favourites, caused by the heavy condition of the course. With the exception of two virtual certainties on which long odds were laid, all the first favourites were beaten on the opening day, six favourites out of seven were beaten on the second day, and five out of seven on the third and last day of the meeting. Notwithstanding the heavy state of the course, Geheimnis won another race, and although she only won by a head, it was generally believed that her victory was in reality a very easy one. Thebais won the Yorkshire Oaks without difficulty, beating Bal Gal and Lucy Glitters. Be the condition of the ground what it may, this wonderful mare always seems content with it. The Ebor Handicap was won by a lightly weighted three-year-old called Mother Shipton. Hagioscope, who is also three years old, was giving her 18 lbs., and the heavy state of the course made this weight a far more serious matter than it would have been over hard ground. For the Prince of Wales's Stakes 2 to 1 was laid upon Dutch Oven, who had hitherto shown some of the best two-year-old form of the season after Geheimnis. This filly has low sweeping action, which is ill suited for heavy ground, while Nellie, a filly by the Derby winner Hermit, out of the Oaks winner Hippias, is rather a high goer, and when the struggle came Dutch Oven was beaten, and Nellie won by three-quarters of a length. Nellie had 7 lbs. the best of the weights. The Great Yorkshire Stakes was won by Ishmael, Cameliard being second, and Tristan third. Cameliard had won the Glatwicke Stakes at Goodwood, and Tristan had won the Singleton Stakes at the same meeting, a race for which odds had been laid on Peter. Ishmael, it may be remembered, had beaten Charibert at Ascot, when 5 to 2 had been laid on that horse. In the Queen's Plate, Exeter beat Madame Du Barry, the winner of the Goodwood Cup, by seven lengths. A strong horse like Exeter can stride through mud when light weedy animals are puffing and blowing, with weary legs and heaving flanks. It is hard to persuade oneself of the degeneracy of the English thoroughbred when one looks at such a grand horse as Exeter.

After Dutch Oven's unexpected defeat at York, great interest was taken in the Champion Breeders' Foal Stakes at Derby—a valuable race, for which Dutch Oven was made first favourite. Fifteen other two-year-olds opposed her, among whom was the Peine de Oeur colt, who had won two races at Worcester, and the British Dominion Two-Year-Old Stakes at Sandown—a race worth 1,310*l*. Exeter, who had beaten the Peine de Oeur colt

by a head at Lewes, was also to run, but on somewhat worse terms than those under which he had formerly been victorious. As soon as the field had settled down to their work, Dutch Oven and the Peine de Ocurr went to the front, and had the race all to themselves for the rest of the course. There was something of a struggle from the distance, but Dutch Oven had the best of it, and won very cleverly by three-quarters of a length.

On the first day of the Doncaster meeting, in the Champagne Stakes, Dutch Oven met Kermesse, as well as Nellie, her conqueror, at York. Carlyle, the winner of the Priory Stakes at Lewes, Pursebearer, and Shrewsbury also took part in the race. Dutch Oven had beaten Kermesse by a head at Goodwood when receiving 4 lbs. from the last-named filly, and Kermesse had beaten Dutch Oven by a length at even weights at Newmarket. Nellie had beaten Dutch Oven by a head, at an advantage of 7 lbs., at York, as we have already observed. Now all three fillies were to meet at even weights. Kermesse was very reasonably made the first favourite, while Dutch Oven was, with equal reason, a very strong second favourite. Nellie was the only other starter that was at all fancied. Pursebearer made the running over the first half of the course, but the three fillies practically had the race all to themselves. Nellie led after three furlongs had been covered, until they reached the half distance, where she was fairly over-paced by Dutch Oven, who quickly deprived her of the lead. Then Cannon brought up Kermesse, when Archer made a great effort to maintain his lead on Dutch Oven; but it was to no purpose, and Kermesse won, after a hard struggle, by half a length. The three colts were quite outgalloped by the three fillies, and were pulled up a long way in the rear. For the Clumber Plate, Lady Emily was a great favourite, 6 to 4 being laid upon her. In the Priory Stakes at Lewes she had only been beaten by a head by Carlyle, and she had run a dead heat with Marden, who had been second to Geheimniss for the Astley Stakes. She made the running to the bend into the straight, where Candahar took the lead, and held it to the end, winning easily by a length. Candahar is half-bred, and it is said that his dam has been ridden as a charger and driven in a cab. Fourteen horses came out for the Great Yorkshire Handicap. The Duke of Beaufort's Petronel was the first favourite, although he was carrying 6 lbs. more than anything else in the race. He was giving 20 lbs. to Edelweiss, the winner of last year's Summer Cup at Newmarket, and he was giving as much as 36 lbs. to another horse of his own age. He was also giving 6 lbs. to Teviotdale, the winner of the Ascot Stakes of both this year and last year. Various horses made the running, the lead being changed very often during the race; and it was not until the field were within a short distance of the winning-post that the two horses which were destined to fight out the race between them singled themselves out and came to the front. Teviotdale was the first of the pair to make a bold struggle for victory; but Petronel came flying after him, and there was a grand race between the two rivals. Petronel looked about as much exhausted as Teviotdale when the final struggle began, but Teviotdale gave way in the last few strides, and Archer induced the brave black horse to struggle on and to win by a neck. Petronel is a thoroughly game and good horse, and although he won the Two Thousand Guineas last year, he is better as a four-year-old than he was as a three-year-old.

On the day of the St. Leger Eastern Princess beat a large field for the first race. Goggles bolted after passing the winning-post, and, after knocking over and injuring several people, jumped the rails and fell, without hurting either himself or his jockey. Exeter was first favourite for the Queen's Plate, 7 to 4 being laid on him, but the three-year-old Tristan got up to him at the distance, and, passing him as they neared the winning-post, won very easily by a length. This good performance of Tristan's was a surprise, for although he had won races this year, he had been beaten five lengths in the Great Yorkshire Stakes by Ishmael, and he had been unplaced in the Derby. There was a fine race between Strathavon and Beatrice in the Milton Stakes. Beatrice, who is a two-year-old, was leading, as they were running in, when the old grey horse dashed up and caught her on the post, making a dead heat. An even prettier race was the Cleveland Handicap. Four horses came racing up almost abreast, and as they passed the judge's chair there was only a head between each of them. Shrewsbury, who was considered a promising two-year-old, although he had not yet shown any remarkable form, was made the favourite for the Tattersall Sale Stakes; but he was easily beaten by Lord Palmouth's filly, Little Sister. Shrewsbury was second and Pursebearer third. In the Great Lancashire Yearling Stakes, Pursebearer had been second and Shrewsbury third. We described the St. Leger last week. We then observed that the attendance was immense. It is reported that 139 trains left Doncaster on the day of the race, and that 8,300 telegrams were sent from or received at Doncaster on that day.

The two most interesting races of the Thursday were the Portland Plate and the Rous Plate. The former was very appropriately won by a mare belonging to the young Duke of Portland. It is a scrambling T.Y.O. handicap and a large field generally starts for it. It is just the sort of race in which clever jockeyship is shown off to most advantage, and on the late occasion, Archer, getting off well with the most heavily weighted of all the fifteen starters, kept her well in hand until he was within a short distance from home, when he rushed forward and won by three lengths. Considering the weight she was carrying (9 st. 5 lbs.), this was a decidedly good performance on the part of Mowerina. This mare, who occasionally shows fine form, although she very often

gets beaten, was bred in Denmark. As much as 12 to 1 was laid against her at the start, and half the other starters were preferred in the betting. It was observed that neither Archer nor Fordham, who rode the second in the race, wore spurs. Only a head separated each of the four leading horses at the finish for the next race, which again was won by an outsider. Then came the Rous Plate for two-year-olds. The great interest of this race consisted in the fact that the first favourite for next year's Derby was to run for it. This was Mr. Rymill's Bruce, a bay colt by See Saw out of Carine. He had cost 1,100 guineas as a yearling, but it is stated that his owner lately refused 10,000l. for him. There seems to be no disagreement among good judges as to the fine appearance of this colt. Some critics, however, think that his forelegs are none of the strongest. He had been out twice before this season, winning his race on each occasion. He was now to be opposed by Dunmore and Fortunatus, to the latter of whom he was to give 12 lbs. Four other two-year-olds were also to run against him; 11 to 10 was laid against him at starting. He won in a canter by a length, in very good style, but he had to be roused up a little before he could shake off Fortunatus. After the Rous Plate 8 to 1 was taken about him for the Derby, which seems a very short price so long before that race.

At last a turn of luck came for poor Bal Gal. On the last day of the Doncaster meeting she succeeded in winning the Park Hill Stakes, the first race in which she has been successful this season. After all her victories of last year, her career this summer has been a lamentable failure. There can be little doubt that Thebais would have won the Park Hill Stakes had it not been that she put her foot into a hole and twisted a plate when at exercise on Doncaster Heath early in the week, in consequence of which temporary injury she was scratched for the race. Out of a field of fifteen two-year-olds for the Nursery Stakes, a well-bred filly called Vista, against whom 20 to 1 was laid, proved the winner. She looked much exhausted at the finish, but her opponents were even more so, and little Lemaire managed to keep her in front until the winning-post was passed. Petronel won the Doncaster Cup, although Tristan made a gallant effort to beat him. A couple of two-year-old fillies, St. Marguerite and Little Sister, ran for the Wentworth Stakes. The former, who had beaten the latter at Goodwood, had run Dutch Oven to a head, and had made a dead heat with Kermesse, was the favourite; but Little Sister won easily by half a length. The winner's two victories at Doncaster prove her to be a very smart filly.

One of the great interests of the Doncaster week is the sale of yearlings and other thoroughbred stock which takes place every day before the races. That these sales are not flagging is proved by the fact that four hundred and thirty-seven lots were advertised for sale last week. The first day's results were not encouraging to breeders. Yearlings were sold for ten and fifteen guineas; several went for from twenty to thirty-five guineas; out of thirteen yearlings sold, only four went for as much as a hundred, and the highest price obtained for a yearling was two hundred guineas, although it is but fair to say that a foal fetched two hundred and twenty guineas. Matters improved very materially on the day of the St. Leger. The crowd in the sale-paddock was enormous. Mr. Tattersall complained, with great justice, that the mob of idlers prevented intending purchasers from getting within reach of the auctioneer, while it was most difficult for the latter to distinguish the nods of bidders among such a sea of faces. He very sensibly suggested that in future sales at Doncaster a fee should be charged for entering the paddock, or at any rate for entrance to a specially reserved enclosure therein. A colt by Albert Victor was soon knocked down for 1,000 guineas; and shortly afterwards, Acrostic, a very handsome son of See Saw's, went for 1,050. Goldmaster, by Rosicrucian, was purchased by Lord Stamford for 1,200 guineas. An excellent judge of thoroughbred stock considers this colt the finest yearling he has ever seen. The highest price of the day was brought in by one of the Beenharn House yearlings, a filly by Cymbal out of Ursula, that was sold for 1,300 guineas. The next morning the sales were even more successful. Two colts by Speculum realized 1,550 and 1,100 guineas. Ulster King, by Uncas out of Pirate Queen, was bought by the Duke of Portland for 1,000, and a couple of colts by Stirling also brought in 1,000 each. The nine Yardley Stud yearlings that were sold attained the splendid average of 556 guineas apiece. One of these was an own brother to Geologist, but he hardly looks likely to turn out as good a colt as the second in the St. Leger. Two other studs brought in averages of considerably more than 300 guineas, prices which surely ought to prove remunerative to breeders. Two foals by Petrarch went for 380 and 300 guineas. Altogether, more than a hundred lots were sold in the course of the morning, at prices varying from 10 to 1,550 guineas. The highest price realized for a yearling on the Friday was 820 guineas, and the lowest price of the week was reached by a foal that was sold for 5 guineas.

The late Doncaster meeting was unusually successful; the racing was excellent, and the weather was beautiful. It is rather a curious fact, however, that the horses which are commonly considered the best two-year-old, three-year-old, four-year-olds, and five-year-old of the year—we allude to Geheimniss, Thebais, Bend Or and Robert the Devil, and Peter—took no part in the racing.

## REVIEWS.

## EXCAVATIONS AT CARNAC.\*

A MELANCHOLY interest attaches to this volume. The author had completed the revision of the proof-sheets only the day before he was seized with the sudden illness which soon proved fatal. The publisher has added a short prefatory note, recording this sad termination of Mr. Miln's archaeological work, and describing briefly the nature and extent of his researches in Brittany. It is a matter of regret that this prefatory matter was not more extensive, so as to put a reader who has not had the opportunity of either visiting Carnac or of reading the author's first work, *Excavations at Carnac* (published in 1877), in possession of indispensable information respecting the localities described and their relation to each other. The absence of this information makes a most valuable piece of archaeological research much less readable than it ought to be. The very title-page introduces us to "the Alignments of Kermario," with no hint of the position of the place or the meaning of the word. Had the author lived, he would probably have added two or three introductory pages—which is really all that is necessary—wherein all these difficulties would have been cleared up. In the absence of such help we recommend those interested in the subject to read the previous work, of which this is really the second part. In the first chapter an excellent introduction to the whole subject will be found, together with a view of the mysterious "alignments" which ought to have formed the frontispiece of the work before us. For the benefit, however, of those who cannot follow our advice, and in order to do full justice to the memory of a distinguished antiquary, we will give a short account of the whole series of explorations which occupied Mr. Miln for nearly six years. In the course of them he was enabled to clear up much of the mystery which has hitherto surrounded Carnac, if, indeed, he did not completely solve the problem which has puzzled so many generations of antiquaries, both French and English. He seems to have been singularly well fitted for the task. Unlike many explorers, he does not start with a preconceived idea, but sets the whole evidence before us just as it was presented to himself, and then states the theory which appears to fit the observed facts most accurately.

It was in 1873 that Mr. Miln first went to Brittany, simply as a tourist. Landing at St. Malo, he visited the numerous places of interest along the coast, and in due time came to Carnac, a small town near the sea on the south-west coast of the department of the Morbihan. It is important, for the sake of the theory afterwards developed, to note the remote position of this metropolis of tombs. Mr. Miln shows that the Breton name signifies "the place of the cairn"; while a village near it, called Oru-Carnac, situated on higher ground, means "the rocky hill of the cairn." In the immediate neighbourhood is a vast multitude of those prehistoric stone monuments which the Bretons call "dolmens," "menhirs," and "cromlechs." The first of these, literally "the stone tables," are composed of large flat stones laid on others set upright, so as to form a chamber, over which a mound of earth is sometimes heaped. About their destination there can be no doubt, for human skeletons are invariably found within them. The monuments, however, which give a distinctive character to Carnac and its neighbourhood are the "menhirs," and the groups of "menhirs" called "cromlechs." The word, meaning literally "the long stones," is applied to the lofty masses of granite of various shapes and dimensions which, set up on end and arranged in rows at regular distances from each other, are now termed "les alignements." It has been estimated that there are about one thousand stones still standing; but a far greater number have in all probability been destroyed for the sake of the material. We know from Stukeley how a similar destruction was perpetrated at Avebury, in Wiltshire. He relates with becoming indignation that he saw the peasants dig a hole at the base of the stone they wished to utilize, push it down, and then split it up by the simple expedient of lighting a fire beneath it. Besides these stone monuments Mr. Miln found a group of mounds situated a mile to the east of Carnac, and named "Bossenno," a word which he considers to be merely the plural of "bosson," a mound or heap. The peasants called them "Cæsar's Camp," and told a wild legend that they had once been "inhabited by the red monks (the Templars), who, having exasperated the country by their crimes, drew down upon themselves a terrible punishment, their neighbours having killed them, and burnt their habitations in one night." The truth of the tale of destruction by fire was amply proved by subsequent exploration. Mr. Miln excavated the Bossenno during the years 1874, 1875, and 1876, and discovered beneath their grass-grown surfaces a series of Gallo-Roman buildings, consisting of a large villa, and dependent structures, the most curious of which was a small temple. The whole had been surrounded by a wall, obviously for defence. The style of the decorations in fresco still visible, and the objects found, indicated a high degree of wealth, civilization, and prosperity. But the most remarkable conclusion drawn from the discoveries made was, that two civilizations and two religions—the Gaulish and the Roman—had here existed, side by side. Ample proofs of this are given in the minute account of the objects found and in the numerous plates drawn by the

author. The buildings had manifestly been burnt, as stated above; but, as no human bones were found, it was concluded that the inhabitants had had time to escape. From the evidence of coins, it appeared that the settlement had been abandoned at the end of the fourth or the beginning of the fifth century.

The further portion of Mr. Miln's researches, the narrative of which fills his second volume, began in October 1877, and terminated in October 1878. During that period he explored the western half of the "alignments," here consisting of ten rows of "menhirs," between the villages of Kermario and Kerloquet—the former of which is about one mile from Carnac to the north-east, and the latter rather less than two miles in the same direction. He was induced to undertake this work by accidentally finding half a Roman tile in a wall among the "alignments"; and on the following day some labourers whom he had sent to dig a trench brought him fragments of Celtic as well as Roman pottery. These indications impelled him, though not without some hesitation, considering how often the district had been examined and described, to submit nearly all the "menhirs," tumuli, and rubbish-heaps within this limited area to a patient and thorough investigation. The objects discovered belong to two classes, the Roman and the prehistoric, and, as at the Bolsenno, the two were frequently found intermingled. This fact was, however, much more remarkable in this district than in the former, because no connexion between the "alignments" and the Romans had ever been suspected before. Now, however, the remains of at least three definite Roman camps were laid bare, in the walls of which "menhirs" had been utilized. This proved that the latter must have existed prior to the Roman occupation, and the weather-worn condition of one in particular showed that it at least must have been ancient when embedded in the wall where it was found. Again, stone weapons and Celtic pottery were associated with bronze horse-bells and Roman pottery. This curious collocation Mr. Miln explains by the ingenious hypothesis that after the Roman occupation the ancient inhabitants of the country, pressed by some of the numerous invasions of the Northmen and other marauders who are known to have ravaged the Breton seaboard, found shelter for themselves and their animals in the disused fortifications of their former masters. Investigation of the "menhirs"—round most of which trenches were dug down to their bases—disclosed remains of charcoal and ashes, with fragments of Celtic and Roman pottery, flint implements, and other objects, among the stones used to prop them up, and sometimes even under them. Thus it would appear that, while many of them are unquestionably older than the Romans, others may have been put up either during their time or even subsequently to it. The ancestral customs of a nation, however, are so persistent, that the fact does but prove that the erection of these stones was regarded with peculiar respect by the original inhabitants, whatever their destination might have been. Mr. Miln considers that this was undoubtedly sepulchral. After showing that the names of the three principal "alignments"—Kerlescant, "town of burning"; Kermario, "village of the dead"; and La Menec, "place of the stones"—all imply death and burial, he proceeds:—

ashes, charcoal, flint chips, pottery, and other objects, are the invariable accompaniments in the dolmens of the rites of sepulture, whether by inhumation or by cremation; and it has been clearly shown, by the numerous excavations of the Polymathic Society of the Morbihan, that the dolmens, whether covered by a tumulus or otherwise, are sepulchral monuments. Now we have seen in the preceding enumerations that we have found all these objects at the base of the menhirs; we have seen that the names given to the menhirs and handed down from a remote period are suggestive of sepulture, and their orientation also is the same as that of the dolmens. We may thus conclude regarding the destination of the alignments that they may also have been erected as sepulchral monuments.

He further shows that at the head of the "alignments" of Menec and Kerlescant the large menhirs form a cromlech, or circle of standing stones. The cromlech, however, unquestionably represented a family tomb in Scandinavia. Here, therefore, we have, according to his view, the graves of the wealthy, while those of the poorer classes are ranged in rows, as in modern cemeteries. The theory is ingenious, and may very likely be the true explanation of these marvellous monuments. One great difficulty, however, forces itself on our mind. We have read Mr. Miln with much care, but we fail to discover that he ever found any vestige of human bones among the ashes at the base of the "menhirs." He caused the soil to be analysed, and the charcoal to be examined microscopically, so that he was enabled to determine that it had been made from pinewood, and therefore the presence of human remains could hardly have escaped him. The ashes of bone are at least as indestructible as those of wood, and had the "menhirs" been used for actual burial, positive traces of it would surely have been found. We readily admit that the presence of the charcoal is very difficult of explanation on any other theory than the one suggested. May it not, however, be sufficient to allow that the "cromlechs" and "dolmens" were places of burial, and that the "alignments" were built to give dignity to them? We once saw a rude rock-tomb on a headland in Denmark, in which bones and flint weapons had been found, and a regular avenue of stones set on end—miniature "menhirs"—formed the approach to it. If, however, we agree to accept Mr. Miln's theory, we have to answer the question, "Why are these monuments concentrated in this region?" Mr. Miln replies, Because the Celts chose it "as a terra sacra or necropolis destined to receive from generation to generation the ashes of their families." He does not insist, as we think he might have done, on the remote seclusion of

\* *Excavations at Carnac (Brittany): a Record of Archaeological Researches in the Alignments of Kermario.* By James Miln. Edinburgh: David Douglas, 1881.

ition; but the following remarks, derived from a long and careful study of the Bretons, certainly deserve consideration:—

To the present time, strangers are so impressed by the manners and customs, and also by the costume, of the present inhabitants of this region, all differing from the other parts, that they are at first led to mistake the women for sisters of a religious order. As an instance, I have heard even French tourists addressing Breton women as *ma sœur*. May not the custom, which still prevails, of wearing ornaments embroidered on their garments, analogous to the signs sculptured on the dolmens, be regarded as a corroboration of the above hypothesis? and may not the solemn gravity of their manners and customs be due to the vestiges of impressions and habits which living amidst the tombs had engendered in their ancestors?

Again, it is certainly curious that, though Mr. Miln discovered Roman remains in abundance throughout the region he explored, he should not have found "either stèle, columbarium, or funeral pit, to denote a purely Roman place of sepulture." He believes that, after the departure of the Romans, the conquered race fell upon their tombs and destroyed them utterly, just as they had destroyed their camps at the Boleanno. In conclusion, it should be mentioned, in justice to Mr. Miln, that he contemplated a third work, in which he would no doubt have reconsidered, and perhaps modified, the views expressed in the first and second.

#### A BOYCOTTED HOUSEHOLD.\*

THIS is one of the numerous books which suggest a problem not very easy of solution. Why is it that the most apparently suitable subjects in contemporary or very recent history so seldom turn out well when they are treated as themes for fiction? The same question may be stated in a rather different way. Why is it that the great masters of fiction are, as a rule, so shy of even the most inviting contemporary or recent subjects? The fact on which the second question rests will hardly be disputed; as to that which underlies the first, it is sufficient to say that, with the exception of *Alton Locke* in English and with no exception at all in French, we cannot think of a single really excellent novel which deals, in either of the two greatest literary languages in Europe, with the history of the last half-century except in very subordinate measure. We put aside, of course, the political novel pure and simple, as well as the novel which aims at interesting its readers by presenting slightly disguised sketches of celebrated characters. But, these excluded, the rule pretty certainly holds good. Perhaps there is no reason to go much further than the profound remark of Joubert, that the poet's subject must offer him "a kind of fantastic region which he can expand and contract at pleasure, a place not too real, characters not too historic." What is said here of the poet is evidently true of the novelist also, as far as his mere story is concerned. Miss McClintock is not the first writer by many hundreds, or rather thousands, who has undertaken a task which is thus almost impossible; and it is fair to say that, if she has not succeeded (and she certainly has not), she has not failed as completely as she might have failed. But the fires over which she treads are altogether too recent; indeed they cannot be said to have even the thinnest layer of *cinnabar* spread over them. The reader, unless he is a very singular person, will be too much occupied by the desire to hang the real live men, quite well known to him, who have brought about the state of things she depicts, or (that we may be quite impartial) too eager to crown and reward the heroic ministers of vengeance who crouch behind hedges, and the Spartan damsels who, having been all their lives petted and spoiled by their landlord and his family, are proud to serve as messengers to tell the heroic ministers of vengeance when they can attack with best chance of success, to think of anything else. There is plenty of sympathy aroused, but it is not the proper kind of dramatic or poetic sympathy. In short, the spectator is too much in the mood of the legendary sentinel who shot a luckless Othello in the Southern States, for that he, being a black man, had the impudence to lift his hand against a white woman.

It must, however, be admitted that there are plenty of reasons besides this principal one why *A Boycotted Household* should be something of a failure. The author has not treated her perilous subject in the manner in which alone it could be treated so as to snatch it out of the fire. Even in the historical novel which does not ignore the contemporary difficulty, it is always necessary to keep the historical action and facts plentifully surrounded with incidents and interests, which are to a certain extent independent of it. *The Abbot* would be as dull a book as Mr. Sala thinks it if it were not relieved by the purely personal adventures and interests of Roland and Catherine; and the *Trois Mousquetaires* itself would hardly be what it is if the greater part of the interest were not wholly romantic and fictitious. Miss McClintock has brought on her stage plenty of characters—indeed rather too many for a one-volume novel—but she has not tried to awaken, or has not succeeded in awakening, any independent interest in them. The best character in the book by far, Julia Harvey, the energetic and outspoken daughter of an Ulster baronet who is safe from boycotting, is a character outside the story, playing indeed the part of chorus and of good angel, but nothing more. Her brother Mark, also a character of capabilities, is kept entirely in the background; and few others of the minor personages, except the two butlers of Sir John Harvey and Mr. Hamilton (the Boycotted landlord), have much life in them. The love affairs

are quite plain from the beginning, are interrupted by no accidents worth speaking of, and, indeed, rather deserve the Poet Laureate's expressive description as "vapid and vegetable" in a transferred sense.

There is no reason to doubt that the sufferings of the Hamilton family have had their exact counterparts in scores of Irish homes during the past two years where the landlords have been less wealthy, less heartily backed by their personal retainers, and, let us add, less self-reliant and ready to carry the war into the enemy's country than Mr. Bence Jones, or Mr. Stackpoole, or Colonel O'Callaghan. Frederick Hamilton is a King's County landowner, with no very large estate, with no property whatever outside of it, and with a large and expensive family. When, therefore, the Land League declares war against him, it finds him destitute of the sinews of war, and he and his are reduced to sore straits. His rents are refused, he is rigorously boycotted in respect of service and provisions, he has to apply for a guard of police, and his only support, besides an old Orange butler, is a tenant, also an Orangeman, and the butler's son, who has taken an evicted occupier's farm, and is consequently even more bitterly hated than the landlord. Mr. Hamilton is twice shot at, the second time with fatal results, though not to himself, and he does not appear to possess the invaluable faculty of a light and free touch on the trigger, though his small son Cyril acquits himself admirably in this respect. Such side interest as there is is concentrated on the eldest son Arthur, a very much spoiled and rather worthless young gentleman who comes to a terrible end, and on two of the daughters, who are snatched out of the fire by beneficent "angels," as Mr. Trollope would call them, in the guise respectively of a Manchester man and a young Ceylon coffee-planter. In the noisy, amiable household of the Hamiltons, shiftless and thriftless in their prosperity, but very soon educated in the most surprising shifts and the sternest thrift by rent-holding and boycotting, Miss McClintock had a subject of which some writers, notably Miss Yonge and the late Miss Keary, would have made a great deal. She has not made very much of it. Ellen and Evelyn, the "beauty daughters," are amiable sticks, and though there is more life in the younger members of the family, especially Cyril, it does not come to much. Unquestionably the best part of the book is that where the boycotted household is quitted altogether, and the scene is shifted to the peaceable dwelling of the before-mentioned Ulster baronet. Perhaps a word of praise ought to be given to a rather nice old maid, Mr. Hamilton's sister, who appears to be much more the mother of the household than its lachrymose and feeble mistress. At the same time, it is fair to say that boycotting and slugs from behind a hedge are trying to feminine nerves—and perhaps to masculine ones also.

One usually expects in an Irish novel some relief in the way of comic dialogue and anecdote, and this is not wholly wanting in *A Boycotted Household*. Sir John Harvey's butler, Brynie, may take fair rank in the long list of Irish comic attendants, especially as his comedy is of an unwilling and cross-grained kind, which certainly would not have been found in any of the other three provinces. It is remarkable, too, that Brynie is not an Orangeman, nor even a Protestant. He is, however, a complete household tyrant; and here are two specimens of his asides at the solemn moment of dinner, which are pretty evidently taken from the life. His wife has been ill, and has died, unknown to the family:—

"One evening at dinner," says Mark Harvey, "my father was making himself particularly agreeable to a lady who was staying here. He was telling stories and giving her his views on politics and theology, and we noticed that Brynie grew crosser and more sidgetty as Sir John became more brilliant. At length he came close to Julia's ear and said, in a loud hoarse whisper, 'Tell the master to hold his tongue and eat his dinner—Ann's dead!'"

There is pathos here as well as comedy, and the remark which one of the visitors makes, "There are different ways of showing grief," is true enough. A less tragi-comic interruption occurs a few pages later:—"The only time Evelyn's demureness gave way was when Brynie poked Sir John's plate almost in Julia's face, and said in his hoarse whisper, 'Hoot, hoot, is that the way to help the master? He'll be able for *twiste* as much as that.'" The clever but unfeeling young lady of the story does not give a remarkably favourable idea of the manners of the best society in Ulster when, to one of her admirers, who, after she has said that she hates long ears, incautiously remarks, "Have you never noticed that I have long ears?" she replies, with agreeable smartness, "I never knew an ass that hadn't." There is some humour and even a grain of probability in Mark Harvey's picture of a future race of Irish Americans, more bitter against England than even Mr. Redpath or Mr. Rossa, being composed of expatriated Irish landlords, who alternately plot against the country which has allowed them to be despoiled, and come over to stir the labourers up against the farmers who have profited by the Land Bill. But the best and most racy story of the book is that of some young Orangemen named Fleming, who, being beset by a superior number of Roman Catholics, bade them "go and look at the skulls in the chapel graveyard, and they would find the marks of the Flemings' sticks on them." In this, which is probably authentic, the picturesque side of Irish faction feuds comes out admirably, and it suggests the famous story of the dying Desmond and the "necks of the Butlers."

There are scraps and crumbs of mild amusement of this kind to be picked up in *A Boycotted Household*, but they are few; nor has the author succeeded in giving a very vivid picture even of the sufferings and crimes which she depicts. In particular, she

\* *A Boycotted Household*. By Letitia McClintock. London: Smith, Elder, & Co. 1881.

hardly attempts any local description, which, owing to the peculiar cheerlessness of Irish scenery, at least in the parts where the main scene is laid, might, without any abuse of word-painting, have been made to heighten the effect very considerably. To sum the whole matter up, *A Boycotted Household*, while it is not a very good novel, is infinitely inferior as a picture of fact to a dozen apparently authentic and trustworthy accounts of actual transactions of the kind which many, if not most, people have read during the last twelvemonth. The newspaper correspondent, whatever may be his value as a contributor to history, is a formidable rival in fiction, and his existence adds not a little to the difficulty of the attempt which Miss McClintock has made, not altogether wisely, nor yet very well.

#### THE GROWTH OF MOUNTAINEERING.\*

LAST year we noticed divers early accounts of ascents and travels belonging to the archaic or fabulous period of Alpine exploration. We now propose to take for our text some recent Alpine publications exemplifying the state to which the years of a generation of men have now brought the art and pastime of mountain climbing. During that time it has been assiduously cultivated, and it would be difficult to point to any other form of skilled exercise, except perhaps rifle-shooting, which has advanced at anything like the same rate. Mountaineering has fairly cast off the marks of green and unfledged youth, and has put on those of the mature age of reflection. Its votaries no longer humble themselves before an unsympathizing public and beg to be tolerated. Newspaper writers, magnificently ignorant of the difference between a moraine and a bergschlund, have almost left off denouncing the foolhardiness of climbers as the summer vacation comes round. The actual performances, if they have unavoidably lost somewhat in novelty, have gained much in assurance and skill of execution. Increased knowledge and confidence have brought increase of legitimate enterprise: and if in some of the younger and hotter spirits of the Alpine Club daring abounds now and then even to rashness, it is certain that such imprudences and elementary blunders as have led to the majority of the serious disasters recorded in past Alpine history are most unlikely to be repeated. The climber's material facilities have also been vastly improved. Not only mountain inns have been established at points of vantage like the Eggischhorn, the Bel Alp, and the Rifel, but the old sleeping-places in holes and corners of rocks are now for the most part replaced by fairly commodious huts. The Swiss and Austrian Alpine Clubs, in particular, have done excellent work in this way. The old Faulberg hut, the resort of all travellers from the Eggischhorn bound for the peaks and passes to which the Aletsch Glacier is the high road, was luxurious compared to the scanty natural shelter used in still earlier times. Now the Faulberg is superseded by the so-called Concordia Hut, which enables the traveller, if not quite to take his ease at his inn in the "Place de la Concorde of Nature," to sleep in fair comfort between four sound stone walls and with a good roof over his head. The luxuries of this building are unknown to the present writer. But they are in their turn surpassed by the equipment of the Austrian Club huts, which are uniformly lined with planking, besides being furnished with tables and benches; inasmuch that when the President of the Austrian Alpine Club made the acquaintance of the Concordia Hut last year on his way to the Finsteraarhorn, he was indeed grateful for what he found, but missed some of the comforts he was accustomed to.

A corresponding change has come over Alpine literature. The *Alpine Journal* purports to be "a record of mountain adventure and scientific observation"; but the scientific element, taking the term in its widest sense, tends more and more to prevail. The common incidents of climbing are treated as well known, and there is felt to be a certain awkwardness in having to describe them over again. Questions of topography, geology, glacier structure, meteorology, the history of earlier expeditions and explorations, and points in the ethnology and local history and legends of Alpine regions are coming more to the front. The taste for Alpine travel, again, has created a demand for improved maps. Such maps of Switzerland as were thought sufficient for a traveller's purposes twenty years ago would now be thought useless by every one whose aim is higher than the very lowest standard of the hasty tourist. The Federal survey is in the main the standard authority for so much of the Alps as it covers. Admirable enlarged maps of particular districts, prepared from the same materials, have from time to time been issued by the Swiss Alpine Club. Our own Alpine Club published a more extensive map, but on a smaller scale, a few years ago. This, while of course it made use of the Swiss official map, embodied the results of independent observation and criticism. An enlarged edition of it has just been brought out. The scale is still little more than half that of the Federal survey (the proportions are 1 : 100,000 and 1 : 190,000 respectively); but it is large enough to combine clearness with pretty full detail. A carefully planned system of indicating marks adds much useful information without overloading the engraver's work, and names

are always given in their proper local form. This last rule may sometimes offend the ignorant and indolent, but is the only one compatible with real accuracy, and will be approved by all who know enough of the use of a map to deserve to have a good one. Then Alpine bibliography, for which very little has been done, is in a fair way to become of itself a subject of respectable dimensions. The collection of the Alpine Club, though as yet far from complete, has made the beginning of a special library, and counts one or two curiosities in the way of early books; and at least one collection as good or better exists in private hands.

One branch of this literature which to a great extent remains to be made is the history of mountaineering. The late Mr. Longman, not the least zealous of the original members of the Alpine Club, intended to undertake such a work, but was cut short in his preparations for it. Some fragments which he had written were published in the *Alpine Journal*; and the past volumes of the Journal contain in various forms a great deal of material relating to earlier as well as recent stages of mountain exploration which the historian would find almost ready to his hand. In the now current number there may be seen a paper read by Mr. O. E. Mathews, the outgoing President of last year, by way of farewell address, in which he gives "a bird's-eye view of our mountaineering history from the ascent of Monte Rosa in 1855 to the ascent of Chimborazo in 1880." This is a good specimen, being pleasant and unpretending in manner, of the reflective stage into which, as we just now said, the literature of Alpine climbing tends to pass. Mr. Mathews fixes the years 1854-1859 as those in which the chief conquests of the Alps were made. In 1859 an occasional volume was put forth with a certain hesitation under the title of *Peaks, Passes, and Glaciers*. It had a success far beyond expectation, and was followed by a second series in 1862. But one year more passed after this, and the regular publication of the *Alpine Journal* was established. In or about the year 1870 (we are still following Mr. Mathews) the work of exploration was for most practical purposes fairly completed in the Alps, except as to a few outlying portions. But even in the best-known ground novelty has not been wanting to more recent climbers. We speak of absolute novelty; though it is to be remembered that whatever a man does for the first time has the charm of novelty to him, and in that sense it is absurd to suppose that the attractions of the Alps can ever be exhausted. But new lines of ascent have been discovered, new combinations of more or less known routes effected, and in some cases points long reputed inaccessible have been attained. Still greater is the innovation of climbing without guides. A few years ago this was looked on by the best authorities as a thing just possible for experienced men in good training, but too risky to be openly spoken of without deprecation. Now a certain number of amateurs have so happily combined enterprise and prudence as to show themselves fully competent to be their own guides, and have established their method as a legitimate branch of mountaineering, though of course a specially arduous one, and to be undertaken only by men of exceptional qualifications. Mr. Mathews's judicious remarks on this head evince a distinct advance of both practice and opinion.

With all this, mountaineering is far from being at the end of its resources. It is steadily extending in range, and leading guides of Switzerland and Savoy have visited every quarter of the world. "Payot has been in America," says Mr. Mathews, "Knebel in the Caucasus, Cupelin at Teneriffe, Maurer in the Himalayas. Devouassoud has bought souvenirs for his friends at Chamonix in the bazaars of Jerusalem and Tiflis, and Jean Antoine Carrel completed his experiences of the Andes by leaving behind him a considerable part of his well-earned remuneration in one of the pothouses of Guayaquil." What has been done in the remoter mountain regions of the world is a mere fraction of that which remains to do. New Zealand and the Himalayas have peculiar claims on English explorers, and offer an ample field. The last-mentioned case presents, moreover, a new problem in climbing. The question has been raised whether life, or at any rate active exertion, is physically possible at such heights as those of the Himalayan peaks. It is a matter on which we are left to conjecture, and opinion is divided. A majority seems to think it probable that the limit of height above which the air is not dense enough to support life is somewhere below, or not much above, 25,000 feet. A more hopeful minority, among whom is Mr. Mathews, decline to accept anything short of positive experience as to where the limit may be. Formerly the rarefaction of the air was supposed to produce on Mont Blanc, and even at much less heights, a variety of distressing symptoms. The early writers' descriptions of the rarefied air on the heights, and the stagnant air in the "snow valleys," are of the most alarming kind. These symptoms are now seldom heard of, and are ascribed without hesitation, in the few cases where they occur, to the traveller's want of training. The 3,000 feet by which Elbrus overtops Mont Blanc have been found to make little or no difference. Lastly, Mr. Whymper has added important new evidence on the point by his expeditions to the great peaks of the Andes, which are, on the whole, the most notable contribution to mountain discovery since the days when the Alps were a strange world. He has found that to live and climb at heights going up to 20,000 feet it is necessary to become acclimatized. But this may be done in a few days at the cost of temporary prostration, and might doubtless be done more gradually—*as, in fact, it is done by natives and settlers in the country—with no inconvenience at all; and when it is done, walking and breathing are at twenty thousand feet above the sea no more troublesome than at our accustomed*

\* *The Growth of Mountaineering*. By C. E. Mathews. ("Alpine Journal," August 1881.)

levels. There is really, therefore, no positive evidence that we are anywhere near the limits of the accommodation possible to human lungs in this respect; and Mr. Mathews boldly prophesies that, "if the highest peaks of the Himalayas are never climbed, the rarity of the air will not be the cause of failure; and if there be no other drawback, then they certainly will be climbed." One other drawback as regards the eastern part of the chain is that it is practically inaccessible from British territory, being in a country to which Europeans are not admitted. To the westward there is no such political difficulty; but the obstacles of distance, time, and cost are sufficiently formidable to make it likely that we shall yet have to wait many years for the Whymper of the Himalayas.

Yet another opening for modern Alpine literature is the description by competent mountaineers of their personal experience and impressions of well-known ascents. The value of such descriptions as literary exercises must depend on each narrator's command of language and power of giving an artistic arrangement to more or less familiar matter. But it is not without scientific importance to establish in this way a sort of continuous comparison of notes. Nothing rests in nature; and the state of the higher mountain regions is subject to changes from which men of science may have a good deal to learn. Certain obvious variations in the difficulties met with by the climber depend on the annual snowfall. But it is quite possible that some periodic law may be discoverable even in the most apparently casual conditions, and we may be sure that no careful observation will be thrown away. Herr Julius Meurer, President of the Austrian Alpine Club, has lately read before his Club and published in its Journal his account of the Finsterarhorn—a good and lively piece of writing, which brings pleasant recollections to the reader who has known the scene in past years. He adds a short but carefully prepared notice of the early ascents and of such of the later ones as are remarkable in any way.

Herr Meurer is evidently a true climber who enjoys his work, and we feel that he well deserved the splendidly clear view that he found at the summit. His opinion of the new "Concordia Hut" has been mentioned above. On his return down the Aletsch Glacier he met a tourist "cradled by the banks of the Spree, as one might guess by his speech," in abject exhaustion and fright, and swearing that not for "die ganze Schweiz mit Haut und Haaren" would he have anything more to do with glaciers. We have not the slightest reason for suspecting Herr Meurer of exaggeration as to this wretched man's condition. But we do suspect that he does not love Prussians; he would not be the only person who does not.

#### LETTERS AND PAPERS OF THE REIGN OF HENRY VIII.\*

(First Notice.)

IN one respect it may be said that the late Mr. Brewer was *felix opportunitate moris*. He lived just long enough to chronicle the fall and death of Wolsey, and left to his successor the task of analysing and calendaring papers of far inferior interest to those upon which he himself was engaged. Unluckily we shall have no more brilliant prefaces to these volumes of State Papers, because there is no statesman to inspire any historian with the same enthusiasm which Mr. Brewer felt for the great Cardinal of York.

We gather from Mr. Gairdner's modest preface that he is not altogether sorry to have been spared the trial of a comparison with his predecessor, and that he acquiesces more contentedly than we ourselves do in the prohibition which the Master of the Rolls has thought fit to issue as regards the amount of introductory matter which may be inserted in these volumes of State Papers. Probably there was no one on whom Mr. Brewer's mantle could fall so gracefully as on Mr. Gairdner. And we should have been glad if the severe rule which restricts the prefaces to fifty pages could have been relaxed in favour of an editor who is engaged on a far more important and more difficult task than falls to the lot of any of the other distinguished persons who are engaged in the production of this series of works. The present editor is working on exactly the same lines as his predecessor, and has to ransack all the great libraries of the country for contributions to his Calendar. In executing this task he must of necessity gain an acquaintance with the domestic history of the country and a grasp over the relations of England to other European nations such as no one else has an opportunity of acquiring. And having thus expressed our regret at the restrictions with which the editor has been fettered, we proceed with our notice of the State papers and other documents which form the staple of the volume.

Two calendars in this series seem to be going on almost *pari passu*, and Mr. Brewer's last volume and that issued by Don Pascual de Gayangos run over the same period, the one calendaring documents from English repositories, the other from foreign sources. Both left off with the year 1530, and Mr. Gairdner's calendar may be regarded as a continuation of both, running as it does over the whole of the following two years. Indeed the most

interesting papers published in this volume are those which have been analysed from the archives at Vienna. We suppose the transcripts have been sent home, and thus we have in this volume by anticipation some of the most valuable papers which will appear in Don Pascual's next volume. We beg, then, to refer our readers to the articles on the State papers in the Simancas archives of October 25 and November 15, 1879, as in this article we shall mainly confine our attention to the accounts of English affairs transmitted by Chapuys to the Emperor.

As to the value of these despatches we must remind our readers that the Imperial Ambassador was sent to England expressly to counteract the King's designs in reference to the divorce of Catharine and to watch all the proceedings of the case. At the point of time when this volume commences, the cause had been advoked by the Pope to Rome. Wolsey was dead, and Campeggio had returned, having done all that Clement ever intended he should do—namely, deferred giving judgment in the Legatine Court. The whole of the year 1530 had been spent in collecting by wholesale bribery the opinions of the Universities as to the limits of the Papal power in dispensing with such a marriage as had been solemnized by Henry with his brother's widow. And the object which, in the first instance, had been to dispose the Pope towards a decision in favour of the King, was now to use them, if necessary, against the Pope, if he should persist in deciding according to justice that the Queen, who had been left a virgin by Prince Arthur, was the King's lawful wife. Henry was still unwilling to break altogether with the Pope; but he was prepared to do that if he could not marry Anne Boleyn on any easier terms. Nothing is more wonderful in the whole history of the divorce than the unbounded influence exercised by this woman over the King's mind. Without feeling obliged to believe the stories of her early life which appear in Sanders's history of the Schism, it is next to certain that she had been guilty of adultery with Wyatt, and that the King knew it perfectly well from Wyatt's own lips. And Mr. Gairdner does not scruple to speak of her as being already in the position of Henry's mistress, saying that it would be mere affectation to deny a charge which was never denied either by the King or by his paramour, though the common report that this was so had been mentioned in at least two Papal Breves, the opinion of the people of England being, what was not far from the truth, that she was a common prostitute who ruled the King at her pleasure. Under these circumstances, it seems as wonderful to us in the nineteenth century as it did to the Imperial Ambassador at the Court of England that Henry should have so persistently desired to make her his queen. The detestation with which she was regarded is well illustrated by a remark made by Chapuys, that upon the narrow escape of the good Bishop of Rochester from poisoning by his cook, a story which is told by the chroniclers of the period, suspicion of Anne Boleyn and her father, then Earl of Wiltshire, of having suggested the act could scarcely be avoided. On the 5th of April following the cook who had poisoned the broth was boiled alive, by an Act of Parliament which was passed after the offence was committed. Chapuys thinks the King has done well to show dissatisfaction at the deed. Probably his account that two of the servants died, whilst the rest recovered from the effects, may be accepted in preference to the printed accounts of the day, that sixteen of them perished by drinking the broth, which Fisher lappily did not taste.

Chapuys's despatches are numerous and tolerably regular, averaging about one every fortnight during the whole of the two years occupied by the present volume. But though there are as many as five letters from Chapuys to the Emperor in the month of January 1531, there is no light thrown upon the disputation which, as we learn from the last published volume of the archives from Simancas, was intended to be held on the 12th of this month. We noticed in our review of that volume (see the *Saturday Review* of October 25, 1879) that Pole was to be Archbishop of York, for the purpose of assisting Warham of Canterbury in deciding the point in favour of the King, after a discussion had been held between six doctors of the one side and six of the other; and we called attention to the fact that only one document had yet been published which refers to this matter. And we were somewhat surprised to find this one document missing in its proper place in this volume, though we afterwards discovered that it has been printed in an appendix. It is a letter from Stokesley to Fisher of January 8. The discussion itself must have been prevented by the refusal of Pole and Fisher to act in the capacity of arbitrator and disputant. We had hoped Chapuys's despatches would throw some light upon the failure of this negotiation; but there are only one or two faint allusions to it, which would have been quite unintelligible but for the existence of this letter; and it is plain that, as the disputation never came off, the present idea was to refer the matter to the Parliament, which was summoned for January 16. We spoke of the remarkable oversight of this document in the Oxford Records of the Reformation. The editor of that volume erroneously placed it in 1533, and that though Burnet had spoken of it in his History and given it its proper date. And it is possible that Mr. Gairdner may have been misled by its not appearing in its proper place in these volumes. Whilst we are pointing out mistakes, we may mention another into which the editor of Burnet seems to have misled the editor of the State Papers. Benedict de Accoltis, who figures in these documents under the sobriquet of "the young man," was not called Benedict Henry. In the document which was printed by Burnet, Benedict II., the

\* *Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII. Preserved in the Public Record Office, the British Museum, and elsewhere in England.* Arranged and Catalogued by James Gairdner, Assistant-Keeper of the Public Records. Under the Direction of the Master of the Rolls, and with the Sanction of Her Majesty's Secretaries of State. Vol. V. London: Longmans & Co.

initial was lengthened into Henrici by his recent editor; but the letter mistaken for H is in reality tt., meaning tituli. The matter is of small importance; yet it seemed worth while to mention it, lest others should be deceived by the agreement of three different persons, who had all read the original document and fallen into the same mistake. We may also notice one other omission of Mr. Gairdner's—namely, the want of a reference in Art. 30 to the thirteenth volume of Baronius's *Annals*, where this document is printed, as containing the Pope's instructions to his Nuncio in 1532, though there can be no doubt it belongs to the month of January 1531.

We learn for the first time from Chapuys's letter of January 23 to the Emperor how the King had attempted to withdraw Fisher, Bishop of Rochester, from the Queen's side, and from that of the 13th that Henry had gone in person to the house of Warham, Archbishop of Canterbury, for the same purpose. Soon after this the Act of Supremacy passed, and the Imperial Ambassador was of opinion that it never would have passed if the Pope had shown more decision. He says the last breve the Pope had written was more feeble than the first, and whereas the King had for a moment thought of sending the lady—i.e. Anne Boleyn—away, "she remains more openly acknowledged than ever." And thus Clement's timidity and dissimulation had not only prejudiced the Queen's interests, but his own authority. The King, however, had said that the Act "was not intended to infringe the authority of the Pope, provided his Holiness would pay due regard to him, and otherwise he knew what to do."

The miserable vacillation and timidity of Clement VII. comes out more strongly than ever in these documents, and was entirely seen through by all the Ambassadors at Rome, and taken advantage of alternately by the Emperor and the King of England. No one was better aware of it than Rustace Chapuys; but there were other Imperial agents who did not scruple to tell the Pope in plain terms what they thought about his conduct. Chapuys himself was, throughout the whole time occupied by this volume, at the English Court, and appears to have been admitted to the entire confidence of the Queen. And this enables him to give the most graphic description of scenes which are hardly alluded to at all in English histories. One such occurred on Wednesday, May 31, 1531. On the evening of this day a deputation from the King, consisting of more than thirty dukes, earls, bishops, and other ecclesiastics, was ushered at nine o'clock in the evening, just as the Queen was going to bed, into her presence. They were instructed by their mouthpiece, the Duke of Norfolk, to remonstrate with the Queen on her persistently appealing to the Pope to decide the cause himself, and that specially on the ground that the temporality and spirituality had recognized the king's supremacy in his own dominions. The altercation between the deputation and the Queen is given at full length by the Imperial Ambassador. It must have been conducted in English, and shows that Catharine must have spoken the language fluently, and was remarkably well acquainted with all the points of the case. Single-handed as she was, she was more than a match for all her assailants. She replied seriatim to all that was alleged by the Duke, refusing to recognize any temporal judge in spiritual matters, of which marriage was one, and, then, upon Dr. Lee questioning her word as to the nature of her connexion with Prince Arthur, and Gardiner adding that the presumption of the law would suffice, and that was against her, she told him to go and ventilate his presumptions at Rome, but that she only cared for the exact truth of the matter, which she would affirm on oath, and also bring proofs of in contradiction to all their lies and falsehoods. If half of what Chapuys relates is true, Catharine must have behaved with great spirit. But some allowance must be made for the bias of the witness when he alleges that Stokesley, the Bishop of London, when he heard the Queen's reasons, had not the courage to speak; and, though he may possibly have been an eye-witness of their "secretly nudging one another when any point touched the quick," he can scarcely have heard the conversation which passed between them after the conclusion of the interview. Nevertheless, we will give his account of it for what it is worth:—

As for the most part of the rest, if they had the liberty of speaking their thoughts, they would have inclined to the Queen's side; but, as they could do no more, they testified their inclinations by showing the satisfaction they had at the Queen's answers. Among these was the secretary, Dr. Stephen (i.e. Stephen Gardiner), who at the commencement unravelled these affairs, but is now very much suspected by the Lady. Some said they had worked hard and counselled long, and devised fine plans, but were confounded by a single woman, and all their designs turned topsy-turvy. Of these was Guildford, the Controller, who said it would be the best deed in the world to tie all the doctors who had invented and supported this affair in a cart and send them to Rome to maintain their opinion, or meet with the confusion they deserve.—P. 137.

It is possible the Imperial Ambassador was writing rather what he thought they ought to have said than what they really said.

We reserve the rest of this interesting volume for another article.

#### EUGENE ONEGUINE.\*

IN spite of the exertions of several able interpreters, Russian poetry remains all but unknown to Western Europe. The names of a few of its leading representatives have been rendered more or less familiar in Germany by Bodenstedt, in France by

Prosper Mérimée, and in England by Sir John Browning. But the great majority of its cultivators have never obtained any recognition beyond the frontiers of their native land. Some six score of them figure in the bulky *Chrestomathy* published by Gerbel at St. Petersburg in 1873; but almost utter darkness hides the forms of all but about a tenth part of their number from the eyes of the inhabitants of those parts of the world which are not Russian. Even of the rare exceptions the foreign fame is neither widely spread nor firmly established. Derjavin's ode entitled "God" is said, indeed, to have found no less than five-and-twenty translators in France alone, and to have achieved a brilliant success in China and Japan. And Krilof's *Fables* have obtained a cosmopolitan reputation. But the other works of those exceptionally fortunate poets are as little known away from home, as are the writings of the other votaries of the Muscovite Muse.

The Russian language lends itself with great facility to versification. And the poetic feeling which prevails among all Slavonic races renders the Russian mind very susceptible to the charm of song. It is not wonderful, therefore, that Russia should have produced many minstrels, from the times which preceded the Tartar invasions, when every petty prince kept bards to celebrate his glory, to the present day, when, amid distant swamps and forests, rustic "rhapsodists" still sing the praises of the ancient paladins of Kief, or improvise dirges in honour of deceased villagers. What is more to be wondered at, perhaps, is that Russia should have produced so few poets for whom even their own countrymen can claim the gift of original genius. But the conditions of life in Russia have been against the development of poetic talent. There may be some truth in the assertion which has been often made, that the Russian peasant is brought up in an atmosphere of song. His mother, it has been pointed out, sings time-honoured lullabies beside his swinging cradle; the lads and lasses who are the companions of his youth disport themselves in circling dance to the sound of choral singing; his marriage, so far as domestic rites are concerned, forms the theme of a kind of operetta; and, after he has drawn his last breath, the regrets of his kith and kin find utterance and relief in metrical lamentations. But the popular poetry of Russia belongs to the past. It has no future before it. For from the peasants among whom it has been preserved little, if anything, in the way of poetic composition is now to be expected. The trading classes have produced a few genuine poets, such as Koltsof and Nikitin for instance. But very little encouragement did those short-lived singers meet with among their fellows. The mercantile community of Russia is very little affected by æsthetic tendencies. Among the upper classes, however, a taste for poetry fortunately became fashionable during the reign of Alexander I., and the habit of writing verse maintained itself in the best society during that of Nicholas. The great social and economical changes consequent upon the accession of Alexander II. to the throne were injurious to the manufacture of verse. The minds of men became serious and prosaic, and politics and philosophy usurped that place in their affections which poetry had formerly occupied. Nowadays, in the disturbed state of the land, there is no opening in Russia for a poet. With the exception of satirical verses, little that is metrical is penned and still less printed. But half a century ago it was the custom in aristocratic circles to be poetic, and the leading drawing-rooms of St. Petersburg were described without any great exaggeration as actual "nests of singing birds." Of course, the greater part of the young guardsmen, civil servants, diplomatists, and statesmen, who for a considerable time continued to carol in a highly creditable manner, were mere amateurs. Their devotion to the Muse was not sufficiently serious to induce them to make any really great efforts, and their literary productions very seldom rose above mediocrity.

Only two of their number have made any distinct impression on the Western world, Alexander Pushkin and Michael Lermontof, and each of these probably owes much of his foreign reputation to the fact that he wrote in prose as well as in verse. Of novelettes like Pushkin's *Captain's Daughter* or Lermontof's *Hero of Our Times* it is easy for a moderately skilful translator to convey a tolerably correct idea. But to do full justice to the poetic merits of those masters of language is a task quite beyond the powers of ordinary writers of verse. This truth must be borne in mind by readers of the translation now before us of *Eugene Onéguine*. Colonel Spalding's version is very faithful to the original, remarkably so considering the difficulties with which he has had to contend in the way of metre and rhyme. Of his poetic faculty a few extracts will be sufficient to enable readers to judge for themselves.

The composition of *Eugene Onéguine* extended over seven years. Pushkin began it in 1823, during his twenty-fourth year, at Kishineff in Bessarabia, whither he had been sent as a punishment for having composed and privately circulated an audacious *Ode to Liberty*. Had it not been for the interference of powerful friends, he would have been exiled to Siberia, a fate which he not very long afterwards a second time narrowly escaped. Had he been in St. Petersburg at the end of the year 1825, he must inevitably have been involved in the insurrection which broke out on the accession of Nicholas to the throne. "All my friends were in the plot," he frankly told the Emperor, when asked what his conduct would have been had he been present on the occasion, "and I could not have deserted them." It is much to the Emperor's credit that he was not offended by this straightforward reply. Rumour asserts that Pushkin was indebted for the absence which insured his safety to his thoroughly Russian superstition. He intended, it is said, to pay a visit to St. Petersburg towards the

\* *Eugene Onéguine: a Romance of Russian Life in Verse*. By Alexander Pushkin. Translated from the Russian by Lieutenant-Colonel Spalding. London: Macmillan & Co. 1881.

close of 1825, and if he had carried out his plan, he would almost certainly have been one of the victims of the abortive insurrection. Fortunately for him, just as he had started on his journey, a hare crossed the road in front of him. So marked a warning was not to be disregarded. Pushkin turned back, and gave up the journey. If the story is not true, it is at all events probable. The last canto of the poem was completed in 1831, the year of the poet's marriage. By that time the vigorous turbulence of his youth had calmed down, and the cynical apathy which is so apt to beset the Russian mind, especially when exposed to the influence of official employment, seemed likely to ensure him the respect of the authorities during a long career, when his life was suddenly cut short by a bullet in 1837. Like Lermontof, he fell in what seems to have been a quite unnecessary duel.

At the time when Pushkin commenced *Eugene Onéguine*, which he described to a friend as being "something in the style of *Don Juan*," his admiration for Byron's genius was at its height. Count Vorontsoff went too far when he charged the young poet with being nothing more than "le faible imitateur d'un original très-peu recommandable, Lord Byron"; but there can be no doubt that Pushkin was in early life so strongly influenced by the English poet that his originality might well be called in question. At a later period he transferred his literary affections from Byron to Shakespeare, and entertained the idea of composing a series of dramatic chronicles to illustrate various periods of Russian history; and he also found in the folk-tales of Russia, as related to him by his old nurse Arina, a fresh and copious source of inspiration. But the poem by which he is best known, that which Colonel Spalding has now translated, owes its existence in a great measure to Byron, and its hero has very much the appearance of being, as Pushkin himself suggested, "a Muscovite in Childe Harold's cloak."

Eugene Onéguine is a young Russian who grows tired of the quietness and dissipation of St. Petersburg, being grievously afflicted by "the English spleen, the Russian *khandra*"—the latter term being a popular Russian corruption of the word "hypochondria." He retires to a country seat of which an uncle's death makes him possessed, and for two days takes a pleasure in contemplating the beauties of nature. But after the second day he finds himself as much bored in the country as he had been in the capital. His only consolation is the society of his friend Lensky, an enthusiastic young poet to whom he becomes sincerely attached. But one evening he takes it into his head to dance a great deal more than is necessary with Olga Larina, the round-faced and entirely commonplace young lady with whom Lensky is in love. A duel is the result, in which Lensky is killed, and Onéguine becomes more melancholy than ever, being constantly haunted by the image of the friend he has slain. Before this fatal event takes place Onéguine has been much exercised by receiving from Tattiana Larina, Olga's exceedingly romantic sister, a letter in which she informs him, in the frankest manner, that she loves him. He is "touched with sympathy," and finds the strange proceeding not wholly unwelcome. However, when he sees her, he reads her a most decorous lecture on her unconventional behaviour. Had he been of a domestic nature, he says, he would have been happy to marry her:—

If in the scenes of home I might,  
E'en for an instant, find delight.  
Then, I say truly, none but thee  
I would desire my bride to be.

But, as he is a stranger to happiness he continues, and quite unworthy of her affection, she had much better think of some one else. For

What can be drearier than the house  
Wherein the miserable wife  
Deplores a most unworthy spouse  
And leads a solitary life?  
The tiresome man, her value knowing,  
Yet curses on his fate bestowing,  
Is full of frigid jealousy,  
Mute, solemn, frowning gloomily.  
Such am I.

Tattiana ponders over the lesson, and in due course of time marries an elderly general. Onéguine meets her in society, and, in his turn, falls desperately in love with her, and writes to inform her of the fact. An interview ensues, in which she reminds him of his frigid behaviour when she confessed to him her maiden love, and says:—

How meekly then I heard you preach—  
To-day it is my turn to teach.

And of this privilege she avails herself to such an extent that she leaves Onéguine standing "as if struck by lightning fire." The last two stanzas of her speech may be quoted here as giving some idea of the Russian poet's sentiments and his translator's versification:—

Onéguine, all this sumptuousness,  
The gilding of life's vanities,  
In the world's vortex my success,  
My splendid house and gaieties—  
What are they? Gladly would I yield  
This life in masquerade concealed,  
This glitter, riot, emptiness,  
For my wild garden and bookcase.  
Yes! for our unpretending home,  
Onéguine—the beloved place  
Where the first time I saw your face—  
Or for the solitary tomb  
Wherein my poor old nurse doth lie  
Beneath a cross and shrubbery.

'Twas possible then, happiness—  
Nay, near; but destiny decreed—  
My lot is fixed—with thoughtlessness  
It may be that I did proceed.  
With bitter tears my mother prayed;  
And for Tattiana, mournful maid,  
Indifferent was her future fate.  
I married—now I supplicate—  
For ever your Tattiana leave.  
Your heart possesses, I know well,  
Honour and love inflexible.  
I love you—to what end deceive?  
But I am now another's bride—  
For ever faithful will abide.

#### HISTORY OF THE EDINBURGH VOLUNTEERS.\*

THE Edinburgh Rifle Volunteers claim the honour of being the first Volunteer regiment in Britain to appear in arms before the Queen. The history of the regiment has therefore been written by a member of the corps, as a sort of commemoration of the coming of age of the Volunteer movement. In the autumn of 1859, the year in which the Volunteer Circular was issued, the Queen was in Edinburgh, and thus the newly-formed Rifle Volunteers had an opportunity of showing themselves, which they seized with eagerness. They all turned out and lined the road by which the Queen drove from Holyrood to her private railway station. As the order to appear under arms on this occasion was the first battalion order issued, and as it is still a matter of self-congratulation with the members of the corps that the appearance to do "homage to their Sovereign" was their first appearance as a regiment, it might have been thought that such new recruits would cut but a sorry figure, and be more suggestive of the awkward squad than of professional warriors. So far, however, was this from being the case, that the Queen commissioned the Lord Provost to tell them that she had been "particularly struck and highly pleased with their appearance and fine soldierly bearing." Nor was the satisfaction thus expressed confined to fair words merely, for the colonel was knighted, as an acknowledgment of the martial ardour of the corps which he commanded. After such compliments as these, it is not surprising that the Edinburgh Riflemen and their historian resent with scorn the attempts made by other Volunteers to rob them of the laurels won by this "first appearance." Mr. Stephen thus crushes such false pretensions:—"Other corps have claimed the honour of being the first to appear before Her Majesty; but, if so, their appearance was not officially recognized, neither were they under arms at the time." The second appearance of the Volunteers was not altogether so satisfactory as the triumphant success of their first appearance might have led them to expect. They had been drilling diligently for six months since that first famous turn-out for public duty, and had in that time so much improved that the inspecting officer, Major Nelson, wrote thus of them:—

The greatest praise is due to all ranks. The captains commanding companies must have worked with untiring zeal and energy—the drill instructors done their duty ably; but, what is of still greater importance, those in the ranks must have paid willing obedience to their instructors. The very silence on parade—one of the most essential points towards obtaining efficiency—convinced me that the corps was being trained under an admirable and correct military system, otherwise it never could have arrived at its present high state of discipline. Indeed, the progress already made is, to myself, marvellous, and I entertain no doubt whatever of the City of Edinburgh Rifle Volunteers ultimately arriving at a very high state of efficiency.

Their efficiency was pretty soon put rather roughly to the test. They were set to the task usually assigned to policemen, that of restraining within due bounds the spirits of a well-disposed and jubilant mob. The return of the 78th regiment of Highlanders after their exploits at Lucknow set the whole city in a ferment. The population turned out *en masse* to welcome the return of their gallant countrymen. All the wynds and closes of the Old Town poured forth a stream of dirty and unruly urchins to swell the throng. The lately embodied Volunteers undertook to line the streets and keep in order the tumultuous rabble. Their efforts were not crowned with that signal success which might have been looked for, considering the praises that their soldierly bearing and high state of discipline had so recently evoked from high quarters. The mob drew invidious distinctions between soldiering in earnest and soldiering in play, and, in their eagerness to heighten the triumph of the war-worn veterans, laughed to scorn the restrictions that the amateur warriors attempted to impose. No sooner were the Highlanders seen coming out of Waverley Station than the unfortunate Volunteers found themselves carried away by the crowd they had been set there to control, "to regain their footing, breathless, perspiring, and shorn of caps and belts, only at the head of the Mound, where the crowd lost a little of its density." One officer got so confused by the tumult that he was heard shouting to his company to "fix bayonets." Luckily his men were much too sorely harassed to pay attention to that or any other order. They had enough and more than enough to do in keeping possession of their own arms and accoutrements.

The next event of importance in the annals of the Edinburgh Volunteers was the review in the Queen's Park at Holyrood, in August 1860. They here formed two battalions, and, "being the

\* *History of the Queen's City of Edinburgh Rifle Volunteer Brigade.* By William Stephen. Edinburgh and London: Blackwood & Son. 1881.

first in Scotland, had the honour of forming the right of the first brigade of Rifles, which was under the command of Lieutenant-Colonel Davidson." Animated by a glowing and patriotic speech from their colonel, who exhorted them to quit them like men, by poetical references to Scotland's scenery and Scotland's history, and to the "glorious spectacle" in which they as the "senior corps of Scotland" were to occupy a "leading place," the Edinburgh Volunteers showed themselves equal to the occasion, and accomplished the arduous duty of marching past the Queen on the parade ground in an altogether exemplary manner. They felt it, however, as a mortifying slight, and possibly a survival of the ancient animosity between the two halves of Britain, that the *Times* "preserved a strict silence on the subject," though "elaborate leaders had been devoted to the Hyde Park display." This same year an application was made to the War Office for "permission to call the Edinburgh Rifle Volunteers a brigade." Though the permission was refused at that time, five years later it was granted, and the Queen honoured the brigade by prefixing her own name to it, so that their honourable title now runs, "The Queen's City of Edinburgh Rifle Volunteer Brigade." The year before this, the regimental band had nobly maintained the fame of the corps by carrying off the first prize in a competition at Glasgow, at which "twenty-five different bands contested for honours." The "quick-step" of the regiment is the old English air "Ninety-five," the same as that of the Rifle Brigade, and, in addition to a brass band, their military ardour is quickened by performers on the bagpipes attached to the corps, as is fitting for Scottish Volunteers.

The brigade sent a detachment of 100 rank and file, with officers, commissioned and non-commissioned, and buglers, to assist in the manoeuvres on Salisbury Plain in the autumn of 1872. This, so says their historian, was the "hardest and most genuine military work undertaken by any portion of the brigade," and as such he dwells upon it in some detail, and with evident pride. Here they were linked to companies of real riflemen, and had to go through all the manoeuvres with them just as if they were professional soldiers. As we are told that "throughout Europe the manoeuvres were watched with careful attention by all the leading military authorities," the Edinburgh detachment were no doubt justified in feeling elated at being commended for the steadiness of their march, as they were by the Commander-in-Chief at the review which concluded the manoeuvres. This is the only attempt at active service ever made by the Edinburgh riflemen. It is a pity that their historian did not delay a little longer the publication of his book, as he might then have added a chapter extolling their hardihood in the endurance of really exceptional hardships at the review of this year. Some forty thousand men were exposed to a deluge of rain for two hours before the march past began. By that time the Queen's Park was nearly knee-deep in mud, so that their powers of marching in good order under difficulties were put to the severest test as they passed their Sovereign. It almost seems as if the elements had been in league this year to daunt the spirit of our Volunteer forces in both kingdoms. The heat of the weather in England had been such that, before the Scottish review took place, the most careful preparations were made for the treatment of possible cases of sunstroke. But sunstrokes are rare in Scotland, even in the dog-days; how much more so in the end of August! And to provide against the soaking rain, without which no general holiday in Scotland is complete, no preparations of any sort had been made. The Edinburgh men were better off than the strangers; for, as soon as the march was over, they could go home to get dried. But the majority of the poor fellows who came from a distance had travelled all night, were ruined upon all day, and had to start off, as soon as the review was over, in their soaked clothes on another night journey. That any of them survived such an ordeal speaks volumes for the hardy nature of the race. But the citizens were almost as callous to the inclemency of the weather as the Volunteers. The day was observed throughout the city with all the solemnity of the half-yearly sacramental fast. All the shops were closed, the church bells rang, omnibuses and trams in the principal streets were stopped, and everyone, old and young, turned out to witness the imposing spectacle. It would be difficult to find a plain better fitted for a review than the Queen's Park. It lies close to the Royal Palace, and is overlooked on the south by the commanding heights of Arthur's Seat and Salisbury Crags, and on the other side by the Calton Hill. These vantage-grounds were from an early hour in the morning covered with spectators, crowded as close as swarms of bees. The voluntary sightseers were, however, better off than the voluntary soldiers, for many of them had plaids and great-coats, and here and there it was possible to hold up an umbrella, whereas only one regiment of the Volunteers was provided with waterproof capes. The plashing rain damped in great measure the brilliancy of the evening fireworks and illuminations which were to celebrate the great demonstration, but not the spirits of the inhabitants. They, with the genuine Scotch pride in anything national, actually congratulated each other on the cool freshness of the weather, agreeing that it was far more healthy than the English heat.

The annals of any British Volunteer corps, even if it rejoices in the title of the "Queen's City of Edinburgh," must perforce be, as the poet describes the annals of the poor, "few and simple." One cannot but admire the ingenuity and industry of any one who, like Mr. Stephen, has succeeded in amplifying them into a book. Although, doubtless, of deep and absorbing interest to the members of the brigade, it is hardly likely to be found amusing reading by

the public at large; indeed, the only parts of it that can expect to claim the attention of the general reader are the introductory chapters concerning the several calls to arms that have stirred the spirit of the Edinburgh folk before the present "Volunteer movement." The first of these here touched upon was when the strength of the feudal force had fallen on the fatal field of Flodden. The Provost was among the slain. There was pestilence in the city, and the municipal authority was entrusted to a provisional Committee hastily appointed, called the Presidents, and they issued a proclamation which has been cited as one of the most striking illustrations of patriotic resolution, calling on all the citizens to take up arms for the "keeping and defence of the town." At the same time, the women were forbidden, under pain of banishment, from going clamouring and crying about the streets, and were bidden to go to the churches and pray for the king and the army when they were not about their proper work. A town guard of citizens was called into being, by authority of the King, in 1682. This town guard did good service in defending Holyrood Chapel from the fury of a Protestant mob half a dozen years later. In the troubles of the "Fifteen" and the "Forty-five" the Volunteering spirit was stirred up in Edinburgh; but the Volunteers somehow never came to blows with the rebels, even when, at the latter date, these entered the capital. While Buonaparte kept all Europe in awe, and Britain was in daily dread of a French invasion, soldiering was, as every one who has read the *Antiquary* knows, very much in fashion in Edinburgh, as elsewhere. Beacon fires were ready to spread the alarm from hill to hill, as in the days of the Armada. One of these fires was accidentally lighted, and all the forces in the middle part of Scotland were mustered at Dalkeith, and had to lie all night under arms. This alarm brought Walter Scott a ride of a hundred miles, which he accomplished in twenty-four hours—quite a feat in those days—to join his regiment. In the "Radical time" of 1819-20 the Edinburgh Volunteers were employed, in the absence of the regulars, to garrison the Castle. This was the last public appearance of the old Edinburgh Volunteers, who were known as the "Old Blues." Their present representatives, the heroes of Mr. Stephen's volume, have now been embodied more than twenty-one years, and the increase in their numbers during that time, and the maintenance of their martial ardour under the most peaceful circumstances, seem to promise a more enduring existence than that of any corps of Edinburgh Volunteers which has preceded them.

#### IN SPITE OF FATE.\*

WE should be sorry to think so ill of the human race as to believe that there is any man, any woman, or any child, who would, of his own free will, read through this story from the first page to the last. It is not, we are convinced, a book that can be read, at least by a single reader. What a relay of readers might do we will not venture to decide. Let no one be so rash, so confident of his powers of endurance, as to make the attempt single-handed. He must, unless his strength or his folly be superhuman, fail before he has gone half-way through the first volume. Even a big family—a big family, moreover, of grown-up daughters—with the help of a curate or two thrown in, could scarcely manage to get all the chapters read among them, though they were to divide the task into portions suited to the strength of each. It is not only that the book is hopelessly dull, without a single character, a single incident, or even a single line, to rouse for one moment our interest. It is worse, far worse, than dull; it is ridiculously pretentious. Mere stupidity we can bear with, and even pity; but stupidity, when it takes to strut in tinsel and to delight in bombast, when it airs itself with a constant smirk of self-satisfaction—above all, when it insists on wearying us almost to death—shall obtain as little mercy as it deserves. What with the Land Leaguers, with their endless flow of froth; the Fair Traders, and their folly; and the lady novelists, life is becoming a burden. Turn wheresoever we may, we are met on all sides by a flood of nonsense. If, however, as seems too likely, we are to be overwhelmed by it in the end, it will be some little comfort to sink laughing; and so, though our efforts seem all in vain, we shall still keep up a stout heart and have, we trust, a few more flings at folly.

The very titles of the chapters of the novel before us gave us a fair warning of what we had to expect. As we read the table of contents of the first volume, the following we found set out as the bill of fare:—"Clotho holds her distaff. Lachesis weaves the web. The meshes threaten to entangle. The weaving of the woof. The glimpse of the ghost. Commonsense [so written as one word] ignores the Fates. The web becomes visible. Atropos cuts her first thrum. Cavendish Square at last." With Clotho, Lachesis, and Atropos, their distaffs, webs, woofs, and thrums, the glimpse of a ghost is not out of keeping; but how, the reader may well ask, does Cavendish Square get into such strange company? The explanation is supplied in a very few pages. First, however, we have given us a second heading to the opening chapter. "Clotho holds her distaff" does well enough in a table of contents where brevity is needful, but, like Lord Burghley's nod, unless it is interpreted, its full meaning is not likely to be seen. Accordingly, the author comes to our aid and writes:—"Chapter I. wherein Clotho holds her distaff, and the shadow of temptation looms in the Gilt Hall." By the gilt hall the

\* *In Spite of Fate.* A Novel. By Katharine Clive. 3 vols. London: Tinsley Brothers. 1881.

one link is furnished by which the Three Fates are joined to Cavendish Square. For this hall was a room in the house of an Earl, whose only son was engaged to a young lady who lived in Cavendish Square. Of course the young people never marry; for, in that case, what would have been the use of Olotho, Lachesis, and Atropos? She gets crushed as flat as a pancake—or nearly so, we believe—by the figure-head of a ship, which fell upon her; and he died an earl and a bachelor. How a young lady—a Cavendish Square heroine, too—should meet so strange a fate might well puzzle the reader. The explanation, nevertheless, is simple enough. Her father was an old Admiral, who was given to drink. On the walls of his study he had had the figure-head fastened up. She had tried to teach him a little abstinence, and had at one time greatly cut down his allowance of whisky. But he had fallen back into his old courses, and was once more what is known in teetotal circles as a frightful example. She, one night, when Orion's belt was shining overhead—where, by the way, it never does shine in these latitudes—was struck by an afterthought that she would go and see whether her father's light was burning. In order, apparently, to do this with greater effect, she first unpinned her long luxuriant hair. The light, she saw, was burning, but there was no sound. The natural inference would have been, we should have thought, that the old gentleman had fallen to sleep over his cups; but then, no doubt, he ought to have been heard snoring. It was perhaps for want of this sign of life that her heart at once beat quickly with wild foreboding. "What if Jucoco?" (the leading villain) "had come at last to murder him? . . . What if a Divine instinct, urging her to his rescue, had been speaking in the morbid restlessness which would not let her sleep." However, when she did at length open the door, the sight that met her view was very much what she might have expected. "She saw her father seated in his leather-chair, holding a glass mid-air, arrested in its progress to his lips. Odours of hot whisky and cut lemon told the rest. She rubbed her eyes, and gave a low cry of sudden pain." No wonder that the old Admiral lost his temper. To have his glass of toddy thus arrested on the way to his lips by the sudden appearance of a daughter with her long luxuriant hair unpinned and hanging down her back, rubbing her eyes, and uttering a cry of pain, was more even than a civilian could be expected to bear with patience. In the case of an old tar, it surely almost justified the swearing which followed in his roughest voice. But with swearing he should have been satisfied. He went further, and took to stamping. "Down came the figure-head of his ship, and so its huge sphinx-like face crushed the forehead of Anne Thorne, his daughter." It is, perhaps, some little comfort to know that after that night he gave up altogether hot whisky with or without cut lemons, that he lived and died very penitently, and founded an orphanage.

Our desire to connect Cavendish Square with the Three Fates has led us far away from the opening scene. We must retrace our steps to the gilt hall of the Earl's baronial mansion. Everything, both inside this place and outside, was very stately. Even the village in which it stood was far from "iconoclastic railway companies with their Gothic furor." It is, by the way, not a little refreshing to find this term used in its good old sense. We come across it a second time in the course of a few pages, where we read that "Farmer Tresham was about as much cut out for a farmer as a Goth for a Prime Minister, and did as well in the capacity." The meaning of this latter sentence is not, to be sure, very clear; but, for the sake of Mrs. Malaprop and her Goths, we gladly pass over its indistinctness. The rustics in this village still pulled their forelock when they met their superiors. This habit leads the author into a digression on reverence, and takes her back to the days "when the old Conservative Johnson bowed to lamp-posts." We hope that the lamp-posts were equally reverential and returned the compliment. Be that as it may—for Boswell does not throw any light, we undertake to say, on the question—Johnson certainly would have been astonished enough to learn that he, or any one else, was a Conservative. We shall soon expect to read that the Conservative Lord Mayor Walworth killed the Radical Wat Tyler. It is, however, impossible to make our novelists, and some of our essay writers, we might add, observe the proper terms whenever they venture to touch on matters of history. To return, however, to the earl's village. It had a rector not unworthy of it, who was the very opposite, we read, of "the popular Jonah's gourds." One of this good man's sons disputes with the young lord the position of first hero. He is thus described:—

His youngest son, Edward, like an impudent wild rose on a grafted standard, unexpectedly developed Radical propensities. It was an enigma to the father, though the sequel was plain enough.

A five years' residence at the University of Cambridge will broaden and deepen the quality of expansion in a man sometimes to an unhealthy extent, and revolutionize the whole current of his thoughts to a marvellous degree.

True, Edward might have grown narrower and narrower in a strait coterie, but his nature was too warmly social to be exclusive; his angles were rubbed down by contact with minds of wider growth, ere they developed into prejudices; and so it came to pass that he looked at things, in general, from a different standpoint to his father's.

But Cambridge alone had not worked this change, there was a deep foundation for it nearer home.

Farmer Tresham had a daughter, Edward's quondam playfellow. That daughter was beautiful.

It is scarcely worth while to pause to examine the author's language, or we might ask how the quality of expansion is broadened

and deepened, and how angles develop into prejudices. Let us leave words on one side, and give our whole attention to the lovers. The lady was indeed beautiful, for she had "the aristocratic chiselled features of an Athenian and the dark luscious eyes of a Provencal." When she entered the reception-room at the hall that was given in honour of the young lord's coming of age, "she sailed into it like a second Cleopatra." It was indeed a night of triumph for her, when she, a mere farmer's daughter, drove up to the baronial mansion, its gateway with its blazoned coat-of-arms was gained, and livery servants proclaimed with stentorian lungs, "Mr. Tresham's carriage stops the way." "The strain," we read, "was caught by others and yet others within, till the familiar name sounded strange, and Cordelia doubted her own identity." It seems a strange fashion of introduction to have it bawled out from servant to servant as each guest arrives that his or her carriage stops the way. We are scarcely surprised to find that Cordelia began to think that she had fallen into some enchanted palace and to dream of one day being a countess herself. So rapid and triumphant was her progress that the young lord, "the cynosure of the evening," forgot the young lady to whom he was engaged, and paid all his attentions to Cordelia alone. The countess took alarm, but "feeling unequal to the task of reproving him, sent to the billiard-room for his father. The result was that Lord Arthur, in the midst of his fourth dance with the young plebeian, was brought to a sudden standstill by the apparition of a tall lackey, with an immediate summons to his father's presence." The old gentleman told the young man that he had himself once been in love with a governess—a dark-eyed *spirituelle* beauty. "Our story," he went on to say, "is too sad; I cannot tell it now; a day I must. Suffice it to say she died, and I—and I—married your mother." The young lord is thereupon so much touched that he promises to crush in the bud his affection for the girl who in her features recalled Athens, in her eyes Provence, in her sailing into a room the famous Egyptian Queen, and in her birth one of the commons of Rome. The anxious father was scarcely satisfied. "He ignores the thought of matrimony," the Earl said, communing sadly with the lanterns." Lord Arthur hastens to take leave of Cordelia, and kisses her hand. "How dare you kiss my hand, Lord Wilton," she said; "I am a plebeian; but I am proud." Meanwhile, her old lover, Edward Fenton, did not tamely submit to the slight cast upon him, and boldly accosted the young lady to whom Lord Arthur was engaged. "Would it be asking too much for you to reward a plebeian with a dance?" he said on the spur of the moment, without premeditation." Even had she wished it, she could scarcely have refused on the ground of respectability, remembering, as she must, how much her own father was given to hot whisky and cut lemons.

Endless complications follow the indiscretion of these young people in thus confounding plebeians and patricians. However, in the end plebeian marries plebeian, and the thoughtless patrician, as we have shown, is punished for his neglect of social distinctions by living the life of a penitent bachelor. Perhaps, after all, he was better off than his unhappy father, for if the old Earl had lost his dark-eyed *spirituelle* beauty of a plebeian, yet never had his heir with a suppressed groan to own to a son of his that "she died, and I—and I—married your mother." From that fate he had been saved by the huge sphinx-like face of the figure-head which had crushed the future countess flat.

#### FOARD'S MERCHANT SHIPPING.\*

MR. FOARD'S book may be looked upon as a marvel of industry. So many good books already existed on the subject of merchant shipping that to justify the appearance of a new one it must needs be an exceptionally deserving work. Mr. Foard seems to have felt this, and to have spared no trouble or time in order to rise to the occasion. And in the result he has produced a book worthy to stand by any of its precursors which deal with the same matter, by virtue of its completeness of treatment, its fulness of detail and reference. The enormous number of cases referred to might indeed seem to some persons unnecessary and calculated to encumber the book and confuse the reader; but it must be remembered that merchant shipping law, except for the Merchant Shipping Acts, is built up mainly of cases and decisions affording authoritative interpretation of the terms usually employed in shipping contracts and determining the rights incidental thereto. Moreover, Mr. Foard has not attempted to embody any number of these decisions in his text; he has given the effect thereof in the body of the work and relegated the references, with occasional short explanatory statements, to a body of foot-notes which sometimes usurps well-nigh the whole of a page. Thus the casual reader can study the text alone, while the lawyer who goes to the book for aid in writing an opinion can obtain a clue to all the settled cases on any given point.

As though expressly to complicate matters, a ship occupies by virtue of statute and customary law a curiously anomalous legal position. It is not a mere personal chattel, and it is obviously neither land nor an incorporeal right. It has been much doubted whether a ship comes under the head of "goods, wares, or merchandise." Much of the difficulty which might otherwise arise out of this state of affairs is, however, obviated by the provisions of the Merchant Shipping Acts relating to the ownership and

\* *A Treatise on the Law of Merchant Shipping and Freights.* By James T. Foard, Barrister-at-Law. London: Waterlow & Sons (Limited).

transfer of British ships, conformity to which is necessary in order to secure the benefits of limitation of liability, and so forth. With all these points Mr. Foard deals fairly enough, albeit he shows a tendency to run into statements of the general law which would be as applicable to a ton of coals or a horse as to a ship. This is perhaps unavoidable, but we can see no particular reason for interpolating a chapter on General Average between one on the ownership and another on the bargain and sale of ships. It is the more pity that this chapter on General Average occurs in such an unexpected place, inasmuch as it is unquestionably one of the best in the book. Not only are the principles on which the doctrine of general average proceeds accurately and clearly laid down, but, what is perhaps more valuable, Mr. Foard supplies a carefully tabulated synopsis of losses which by law or custom have been included in, or excluded from, the category of general average, availing himself freely of the American cases, which have always been accorded considerable weight in our courts. Among the methods by which ships can be acquired enumerated by Mr. Foard we are surprised to find included at p. 155 "capture by a merchant vessel bearing letters of marque and reprisal," with imaginary instances of English vessels acting by virtue of such letters. Mr. Foard appears to have totally forgotten the Treaty of Paris, to which England was a party. The omission is the more remarkable as only two pages later Mr. Foard refers to this very Treaty of Paris on the rule of "Free ships, free goods."

Apart from absolute ownership, vessels may be the subject of other legal rights, such as that conferred by mortgages or bottomry bonds. The position of a mortgagee of a ship, like that of a mortgagee of land, may be looked at in two lights, the legal and the equitable. He is the legal owner of the ship, but does not possess all the rights, and is not subject to all the liabilities, of an ordinary absolute owner. He is not in virtue of his position liable for necessities supplied to the ship; nor is he, unless he has actually or constructively taken possession of the ship, entitled to freight earned by her. This last point was only very recently settled by the House of Lords in a case of *Keith v. Burrows*, duly referred to by Mr. Foard.

The position of the master or captain with regard to the ship he commands and the cargo on board of her receives due attention from Mr. Foard. It is obvious that, apart from his ordinary duties in navigating the ship and maintaining order among the passengers and crew, the master may occasionally find himself in exceptional circumstances requiring the exercise of a larger authority than that expressly confided to him. For instance, the vessel may be stranded or damaged far from her home port, and it may become imperative to raise money in order to procure assistance or repair damages. The occurrence of such emergencies constitutes the master the special agent of the owners, with almost unlimited powers. He is bound, if possible, to communicate with his owners and to get their instructions; but when such communication is impracticable, he may of his own authority pawn or pledge the ship and freight, or hypothecate her by means of a bottomry bond. It has been held that in hopeless cases, where there is no prospect of ever getting the ship home, he may even sell her outright, and that such a sale confers a good title on the purchaser.

With regard to the cargo, the master's rights are somewhat similar, though naturally, as the shippers have had no voice in his appointment, a still stronger case of necessity must be shown in order to constitute him their agent, and it must be proved that communication with them was absolutely impossible before any unauthorized dealing with the cargo on the part of the master can be justified. Where, however, these conditions exist, the master may, after exhausting the resources of ship and freight, hypothecate or even sell portions of the cargo in the interest of all parties concerned.

The other duties of "The Master as Agent," such as employing pilots, assisting vessels in distress, and so on, are also fully treated by Mr. Foard in the chapter bearing the above heading. The author adopts a very convenient form when dealing with charterparties. In addition to a general discussion of the subject, for the purpose of analysis he splits up the ordinary form of charterparty into its component clauses, reprinting each at the head of the page until it is finally disposed of. Of course charterparties, being merely contracts between the shipper and shipowner, are subject to any amount of variation in terms; but custom has introduced common forms until a measure of uniformity practically exists, and Mr. Foard's disquisitions thus acquire considerable general value. One or two of his statements of the law appear, however, to require some reconsideration, as where at p. 371 he denies the right of a maritime carrier to contract himself out of all liability, unless an alternative higher rate be paid for carriage; and where he implies, at p. 377, that a claim by a consignor within a certain time specified by the charter party is not necessarily a condition precedent to his recovering for a loss. Unquestionably some doubt exists on these and similar points; and Mr. Foard's suggestion of an International Commission to consider and, if possible, reconcile the various views entertained in different countries on the subject of the liabilities of maritime carriers, seems worthy of consideration.

Bills of lading receive similar analytical treatment at Mr. Foard's hands, and he has in this part of the book been far more skilful in avoiding the introduction of general principles of law, and at the same time making perfectly clear the legal basis on which the bill of lading cases which he embodies proceed. Bills of lading, as being the instruments on which shipowners

mainly rely for the limitation of their liabilities in respect of the goods carried in their vessels, generally incorporate an inordinate number of restrictive clauses, and the way in which Mr. Foard has gone into these in all their intricacies entitles him to very high praise. As a specimen of careful work, we would select his treatment of the clause relating to ~~any~~ freight where the voyage is brought to a premature conclusion, and the duty of the master to tranship goods on to another vessel in order to forward them to their destination. These two points have been the subject of an immense mass of legal discussion and decision; and it must have cost Mr. Foard great labour to reduce the substance of such discussions and decisions within the limits of the pages he has assigned to them.

The last chapter in the book is devoted to the question of stoppage in transitu—the right of an unpaid vendor to stop goods in course of carriage by sea on becoming aware of the insolvency of the consignees. It was long a vexed question whether the exercise of this right operated as a rescission of the contract of sale, or merely reverted in the vendor a possessory right to retain the goods until payment of the stipulated price. Mr. Foard pronounces definitely in favour of the latter view, and, though we are not prepared to contradict his statement of the law, we cannot help thinking that the point is one on which more remains to be said.

We regret to have to notice that Mr. Foard's book is frequently marred by little inaccuracies of composition and grammar for which probably he is only partially responsible; words have crept in or been left out or the wrong word used in many places, and though the sense is generally pretty plain, an appearance of slovenliness is given to the work which has a bad effect.

#### LYELL'S FANCY PIGEONS.\*

THE venerable antiquity of the literature of the pigeon fancy is beyond all question. The Jews had their domesticated pigeons, although not certainly choice fancy pigeons; but among the Romans, both Columella and Pliny attest the extent to which the rage for this speculative fashion was carried among their contemporaries, and it would seem, from the most cursory survey of the History of Fancy Pigeons, that a rivalry in this particular study of a special branch of ornithology has characterized European and English societies for the promotion of the most perfect breeds, and brought fancy pigeons to that pass that the puzzle must be the limit of the survival of the fittest. Mr. Lyell, in his first chapter, on the "Origin of Fancy Pigeons," traces the common original to the British blue rock pigeon, a denizen of our sea-coast rocks and caves, between which and a common blue flying tumbler the difference is slight. Their colour is identical, their size nearly so. The head and beak of the tumbler differ from the rock pigeon, and the pinions of the latter are longer and stronger, as would be the case from their mode of life. Sub-varieties of the blue rock are found in Europe, Asia, Africa. Mr. Lyell marshals carefully the arguments for this common origin which have been so ably summarized by Mr. Tegetmeier, and, amongst others, uses the argument that in domestication man's guiding hand fixes on certain variations on account of their originality. By pairing any curious specimen of a breed with one of a common type, the young may not prove uncommon, but they, paired with the progeny of their own uncommon parent stock, are then apt to reproduce the desired peculiarity. "In this way," continues Mr. Lyell, "I believe every fancy pigeon, however now removed from the blue rock, has been produced; and, judging from the analogy of canary-breeding quoted in p. 5, it does not seem to take very long for nature, guided by the reason of man, to produce the greatest differences in form." To a chapter full of instances of curious sports and strange types of pigeons cropping up in divers places and cases, Mr. Lyell adds as a conclusion the suggestion that, *à propos* of the further search for new and distinct forms, they are to be looked for in Central Asia, or the interior of China, or of Northern Africa. "If any one," he adds, "with pigeon on the brain, time, money, and daring, would penetrate to Timbuctoo, he might there find something worth bringing home with him."

There can be but slight difference of opinion about the accommodation required for domestic and choice fancy pigeons. No one who has considered the origin of the "blue rock," its innate love of salt and gravel, as evinced on the gravel paths of lawns much frequented by the birds in the present season, where the weed peculiar to the gravel is part of the attraction, can doubt that the average pigeon is hardly under conditions of proper aspect, light, and ventilation, though it is worthy, in view of its choiceness, of better housing than the usual resource of wall-boxes, or of the exploded pigeon-houses sometimes called pole-houses; it being a *sine quâ non* with the former that they should not face north or east, and should be made of larch or fir, well jointed, so as to keep out wind, except at entrance or egress. For pigeon-keeping for table purposes a rough cote will be enough, and into it, duly protected, fenced, and provisioned for a few days, the best plan is to purchase young pigeons ready to fly, but not yet having tasted liberty; by which simple means a good number of young will be produced every season. If, however, the aspiration is to pure

\* *Fancy Pigeons: containing full Directions for their Breeding and Management; with Descriptions of every known Variety, and all other Information of Interest or Use to Pigeon Fanciers. Illustrated. By James C. Lyell. London: The "Bazaar" Office, Strand. 1882.*

fancying, it is a case for going beyond wall-lofts, and fitting up with carpentry—cat, rat, and mouse-proof—a building-shed or loft, which will be the better for open air, except perhaps with choice pouters, carriers, short-faced tumblers, jacobins, and fantails. Even then the owner must risk a little with an eye to his place and his birds; and, under reasonable precaution, a small open-air flight will aid the birds in good health. Mr. Lyell, in c. 3, assists his readers with a plan of a tolerably complete pigeonry. The nesting-boxes of this domicile are lucidly described and figured; and the whole process for each pair of nests, in reference to the compartments, to the nest-pans, the hoppers, and the requisite scrapers and shovels, promotive of vital cleanliness, is easily understood, though hard to describe succinctly. Mr. Lyell distinctly bans for the better sort of fancy pigeon what may be called the clothes-peg arrangement on the walls of a pigeon-house for perching.

Amongst other most instructive chapters are those on Selection of Stock, on Feeding and Breeding, and on Diseases. As a rule, pigeons of pronounced markings—i.e. baldheads, turbits, nuns—look best on the wing. Pouters of second quality, half-bred pouters, and carriers are also recommended as capital flyers and *gyrators*. Indeed, the pigeons that become most familiar with their owners are pouters and fantails. And this is well ordered, for the former should be very tame for exhibition, as otherwise they lose beauty and success in competition, whereas the carriers look best wild and alarmed. Ruuts belie the quiet look they carry in the loft, and carriers also are very vicious, as were also trumpeters before the so-called Russian importation, and owls, Oriental frilled varieties, and turbits in a less degree. For pigeons of striking and varied plumage we are directed to archangels, almond tumblers, German toys; for contrasts of colour to nuns, magpies, swallows, &c.; while pouters, carriers, short-faces, burbs, jacobins, fantails, owls, &c., represent high-class pigeons of more difficult production, and so more highly prized. Beside the breeds of strictly fancy pigeons may be reckoned the homing or racing pigeons, which constitute a distinct fancy branch, for which formerly the dragoon, long-beard, and skinnum were used in England, but most use is now made of the Antwerp carrier. *A propos* of feeding, one or two principles should be adopted about the grain on which fancy pigeons are fed. It should not be too new or too old, but kept free from damp, and changed from one bin to another often, or shaken to destroy moths and insects if kept in sacks. Peas are a staple food for fancy pigeons, and Mr. Lyell has excellent experiences of white peas imported from the Continent, which he has found first-rate in pouter-breeding, with Indian corn mixed. Wheat is used freely in summer; barley is a good and cheap food for fancy pigeons; Indian corn or maize is the cheapest of grain for nutritious qualities. Mr. Lyell's experience adds a pigeon grain grown in Bengal, called "mollah," which costs there 3s. to 4s. per maund of 82 lbs., is first-rate food, and might be most profitably imported into England. Except in winter, lettuce and such green stuff may be freely used by pigeons in confinement. Bathing water should be allowed twice a week. Our author sums up "the elements of success in breeding" in well-bred stock birds, properly supplied with good food and clean water, paired with a due eye to their own and their ancestral form, furnished with proper breeding accommodation, and not overcrowded, but kept clean, and tended with every reasonable care by a lover of them.

Time might be spent to advantage in tracing in Chap. VI. the variations of the colours of fancy pigeons on the original blue rock and its Asiatic congener; the blue chequers, the red tints or moalies, which are the most crude and original colours in tame pigeons, and so are the basis of all others. The silver is an offshoot of the blue, the body tint assuming here a dun, the neck and wing bars a deeper hue of the same colour. Similar markings, according to distinct rules, follow the interbreeding of set colours, a notable barred colour being the powdered blue found in the Mahomet. But to dabble in these matters is of no profit to mere amateurs. The road to practical knowledge is a gradual acquaintance with breeding under the guidance of such an intelligent manual as that of Mr. Tegetmeier, which may aptly be supplemented by Mr. Lyell. Mr. Lyell begins his description of every known variety at p. 68 with the Nun Pigeon, and runs over a most voluminous list, concluded at p. 323. The Nun, from its striking contrast of colours, stands high among those toy pigeons which are considered the best for incipient breeders to experiment with; it is a pearl-eyed bird with a tumbler's head and beak. In the black variety, which is the favourite among black, blue, dun, red, yellow-headed, this eye has a narrow blackish cere. The Nun is valued for the number of its coloured flight feathers, which, to be perfect, should be ten on each side; for its *bib*, the head colour extending beyond the throat; and the *shell* (wrongly termed *hood*), at the back of the head. This trim-built bird is a good breeder, and its French and German names dub it "Pigeon Coquille Hollandaise," from its shell crown, and "Das Nönnchen," from its appearance. On account of the less contrast in colour, red and yellow headed Nuns are less prized than blacks; but Mr. Lyell holds that, could red and yellow Nuns be produced as lustrous in colour as the hues some pigeons display, they would be more marvellous than blacks. The Helmet, which comes next in review, is a kindred German tumbler, of the size, head, beak, and body of the ordinary flying tumbler; and Moore describes it as "gravel-eyed." Other toys very suitable for amateur beginners are turbits, swallows, and magpies, the

last a popular variety, very small, with pearl eyes, and bred chiefly in black, red, and yellow. The head is like the dove; wings, flights, thighs, and underbreast, white; and all else of the marking colour divided by sharp lines across breast and shoulders from the white. A remarkable fancy pigeon, most probably named Archangel from its vivid metallic lustre on back and wing-feathers (Neumeister takes its German name, "Gimpel" = bullfinch, as allusive to its colouring), is a native of the Tyrol and South Germany, but is not at all connected with the town so named. Mr. Lyell traces this breed originally to Turkey, and connects them with the famous pigeon-flyers of Modena described in pp. 78-79; and, from finding two pairs of them with a fancier in the North-West of India, he was inclined to believe them an Asiatic production, either Persian or Indian. In style, size, and formation like the common field-pigeon, the Archangel is characterized by its bronzed, burnished, metallic lustre. In style of head this pigeon should be peak-headed, the feathers at the back of it drawing to a finely-pointed crest, the higher-reaching the better. The back, rump, and wings show tints of marked metallic burnish, which are described, when the bird is in motion, "as sparkling like coloured jewels of price." Among others which may illustrate Mr. Lyell's research and extensive knowledge, may be noticed, p. 81, the "Ice Pigeon," so named by German fanciers from its beautiful lavender-blue colour. Its simplest type is clear, light blue, without wing bars, but with dark flights and tail bar. It is of the size of the common field pigeon, but more thick-set and broader chested. This bird is of infinite variety; but, though a pair are pictured to face p. 174 in the pages of Mr. Tegetmeier, we fail to find them described in his volume. Still rarer may be accounted the *Fire Pigeon* (*Die Feuertaupe*) a pigeon which Mr. Lyell owns to having never seen. He quotes Neumeister as reminding him of "a strong tumbler, of the size of a medium field pigeon—head unhooded, feet smooth, colour of the whole plumage black, with an extremely bright, copper-red sheen." This metallic lustre is with the Fire Pigeon more intense than with any other, not only on the neck, but over the whole body, flights and tail excepted. The author of this volume dilates upon the lustre of the rare Fire Pigeon as a sight for a fancier to envy, and does his utmost to stimulate the emulation of those who have facilities of acquiring and breeding with such German toys as these or the Nuremberg swallows.

#### AMERICAN LITERATURE.

THE supply of new American books at this season is always scanty, and is on this occasion even scantier than usual. The most important of the works (1) sent to us is one of extreme value, but of very limited public or popular interest; a work for which there will be no demand, except from a few great public libraries in this country, but one whose compilation must have cost enormous labour and most elaborate care, and which gives proof in every page of unwearied research in the collection of materials, and most thoughtful and painstaking labour in their arrangement. It is, or aims at being, a complete list of all works published in the United States, and accessible to general readers up to July 1, 1876. Local directories, periodicals, sheet music, unbound maps, and cheap pamphlets are necessarily omitted. But reprints, importations, Transactions of learned Societies, works issued by the national Government, and the law reports of the different State Courts, have been, as far as possible, included. An appendix contains a list of new books and new editions issued since July 1876 by the principal houses, which, as regards those works for which there is likely to be search or demand among those who use the Catalogue, practically brings it down to date. It extends to five large quarto volumes, though this is a matter of arrangement and binding, the work being issued in sheets. The most striking peculiarity in the arrangement of the lists is the employment of two distinct alphabetical orders—one containing the names of authors and titles, the other rearranging the works as far as possible under their subjects. It will of course be the imperative duty of all great public libraries wherein American books are to be found, to procure a copy of this Catalogue for the benefit of their readers. In the British Museum, and the local institutions of high pretension and general use now growing up in most of our great cities, students will be able to refer to its pages and to learn from them what works of importance have been published in America upon the subjects in which they are interested, and where they are most probably to be procured. It is to be borne in mind that, even as regards merely English literature, no inconsiderable part of the most valuable works in many departments of study are of American origin, and also that on scientific, political, social, and practical topics an immense amount of information hardly accessible in any other form is contained in the publications of the Federal and State Governments and in the Transactions of American scientific Societies. A Catalogue which enables the student with more or less of pains and research to discover what books of these classes have been published in the United States, and to form some general idea of their contents, was absolutely necessary to the completeness of our knowledge of any branch of English learning; and Mr. Leypoldt and his

(1) *The American Catalogue, under the direction of F. Leypoldt. Author and Title Entries of Books in Print and for Sale (including Reprints and Importations).* July 1, 1876. Compiled by Lynds E. Jones. New York: Armstrong & Son. 1880.

conductors deserve all credit and no small amount of public gratitude for the service they have rendered.

Another volume of the invaluable, but excessively elaborate and lengthy, Report of the United States Geological Survey (2) has just reached us. It deals exclusively with the geography and geology of the Black Hills in Dakota, whose minerals have rendered the territory here described the scene of unscrupulous encroachment by adventurous miners and settlers upon the Indian reserves, and provoked no small resentment on the part of the waning native tribes, once more driven out of the homes secured to them in nominal perpetuity by the greed of the white intruders. The information given is scientific rather than practical, covering more than 500 quarto pages in large type, and illustrated by numerous admirably executed plates showing the fossils of the region, a great number of which are common to extensive strata in Europe and America. These, however, are almost exclusively shells and other relics of the lower types of animal life, belonging exclusively to the strata which the writer calls Primordial, Jurassic, and Cretaceous.

The only other work of much pretension or value upon our list for the month bears the somewhat inappropriate title of *Primitive Industry* (3). Dr. Abbott deals exclusively with the relics, Neolithic and Palæolithic, of the races which, before the European discovery of America, inhabited the Northern Atlantic seaboard. From this part of the States, for some reason or other, the much more interesting remains of the Mound Builders are almost entirely excluded. How it happened that a race so powerful, extending over so large an area, and with an organization so powerful and a civilization evidently so far developed, should not have crossed the Northern Alleghenies, it is by no means easy to understand. They did make their way to the seaboard of the Southern States, though their principal seats were all in the valley of the Mississippi or in those of its tributaries. It seems certain that they could not have been prevented from access to the sea along the greater part of their Eastern frontier by any rivals then existing. At no time during the height of their prosperity is it conceivable that the Indian tribes should have been able to hold their own against the race which built the huge fortifications and other earthworks scattered in such vast numbers over the interior of the United States, even if, which hardly seems probable, the two races were in any part of that area contemporaneous. And yet the general estimates of the Mound Building period hardly place it so far back as to allow of any vast change in the geographical or climatic character of the country. We can hardly suppose that New England, still less that Eastern Pennsylvania and New Jersey, were then under the sea or covered with the ice and snow of the Glacial period. The relics of which Dr. Abbott has made and examined exceedingly extensive and various collections are believed by him to belong exclusively to the Red Indian race, to whom certainly must be ascribed the later stone and copper weapons, implements and utensils, and, with almost equal certainty, the whole of the much less numerous relics of pottery discovered in the same limited region. It seems plain that in America, as in Europe, there was a primitive age of Stone, divisible in the New as in the Old World into two well-marked periods—that of the rude, chipped instruments, many of which an unpractised eye would not recognize as of human origin, known as Palæolithic, and that of the grooved axes, the polished hatchets, arrowheads, spears, and knives which in Europe seem immediately to have preceded, perhaps to have been contemporary with, the first introduction of bronze. The latter material was unknown to the American tribes; and copper, which was worked in large masses and dug from deep mines by the Mound Builders, seems to have been little used and very clumsily worked—almost entirely hammered—by the Indians. According to Dr. Abbott, few of the hatchets could have been useful as implements of industry. They could hardly have cut down a tree of a foot in thickness without an amount of labour for which the Indians, as known to European experience, would never have had patience. There are, however, gouges and chisels of greater sharpness and higher quality, that have evidently been employed to hollow out canoes from solid trunks at an expense of labour scarcely less than it would have cost to cut down the trees with the hard and tolerably sharp stone hatchets of the later period. The truth may probably be, as the author suggests, that fire was a simpler and more easily available instrument, that the outer part of a tree selected for use was girdled with fire, the charred wood then cut away, and the process repeated until the tree snapped or was pulled down. Pestles and mortars of every form, from the rudest stones partially hollowed by the accidental action of water; hatchets of almost every form and shape, and of every material that the country afforded, from the argillite which seems to have been the sole material of the Palæolithic age to jasper and diorite; arrowheads, more or less elaborate; slate knives, generally of semi-lunar form; ornaments, and minor implements of stone or bone, are found in great abundance throughout the region explored by Dr. Abbott and other labourers in the same field—in such abundance, indeed, as to indicate either that the field of their researches was a central manufactory or that it was more densely peopled than is commonly

supposed or than it is easy to believe. Numerous open-air workshops have been found, where the remains, not only of more or less finished implements and weapons, but of the materials collected and the innumerable chips struck off in the process of manufacture, show that the site must have been occupied for many years by the same or different manufacturers, who must have made a lifelong and exclusive business of supplying their fellow-tribesmen, and possibly more distant tribes, with weapons that doubtless acquired a special reputation. It is quite conceivable that such manufacturers may have enjoyed a special protection from tribes dependent upon them for that success in war, in the chase, and in their rude agriculture which was the first necessity of existence. Nearly every peculiar trace of the life of the Stone ages which recent discoveries have rendered familiar to Europe, except, perhaps, the lake villages of Switzerland, seems to have had its analogue in America, even to the kitchen middens of Denmark. The striking resemblance, and, indeed, practical identity, of implements of every kind in regions so remote, affords matter for very curious speculation as to the connexion of these primitive races in such distant quarters, or the origin of similar devices in similar circumstances and necessities. The latter solution might explain very simply many circumstances upon which archaeologists have built, somewhat too confidently, perhaps, an elaborate structure of inferences.

The majority, we think, of Carlyle's (4) readers would be disposed to question any theory that assigned to him a systematic philosophy, a consistent body of doctrine or opinion, whether upon morals, politics, or social life. Perhaps no man of equal thoughtfulness and power was ever less systematic and methodical in his views. A few distinct and very definite principles, or rather preferences, characterize Carlyle's writings on every subject, his conclusions on almost every question of ethics or history. His admiration of force, his belief that might makes right as between classes, nations, and even individual princes and statesmen, is clear enough in most of his earliest productions, and to the very last never seems to have deserted him, or to have been modified by other and higher considerations. His faith in what he called truth, or rather in consistency of purpose and soundness of workmanship, physical or intellectual, was another equally strong, equally characteristic, and much nobler conviction. But neither idea can be considered as the basis of a philosophy of history or politics, much less of morals, and it would be difficult for the most ingenious and patient admirer to trace any other principle or conviction half so clear, persistent, and definite in the best-considered and most temperate of Carlyle's writings. No man, perhaps, was ever more completely governed by a few violent prejudices thoroughly independent of reason, conceived in very early life or implanted by education, and firmly cherished to the last without an attempt to justify them by argument. To ascribe to such a man anything like a philosophy of his own is to ignore altogether the peculiar bent of his mind and the peculiar effect of his writing. In truth, nearly all of Carlyle's moral teaching that has exercised a beneficial effect upon his age, or is likely permanently to influence even a small body of disciples, might be summed up in a proverb almost as old as the English language—an idea firmly rooted in the deepest subsoil of the English nature—that whatever is worth doing at all is worth doing well. And, indeed, Mr. Mead fails to work out his own purpose in anything like a consistent shape. He scarcely professes to give us a Carlylese philosophy, but rather seeks to show what Carlyle thought upon a variety of unconnected questions, international, social, moral, political, and historical, and to soften some of the most offensive of these opinions—always extreme, and now and then ferocious and irrational—by the quotation of other, sometimes incompatible, utterances on other topics and in other places. His book may do something to familiarize with Carlyle's mode of thought, and with a few of his most often repeated notions, that large class of American readers who would not have leisure or patience to study their author in the original. But the notion of Carlyle's character and position in literature, and his influence as a moral teacher, which such readers will derive from this little work will almost certainly be distorted, disproportioned, and incorrect.

Messrs. Kiddle and Schem's *Dictionary of Education and Instruction* (5) contains a number of commonplaces, and a variety of more or less sensible and instructive quotations upon the general methods and particular subjects of education at large, and of the special kind of education most common in the United States. There is, however, little of definite consistent purpose, little of distinct knowledge or belief, whether as to principles or details, to bind the gathered materials into a single scheme; and the inexperienced teacher who should refer to this Dictionary for guidance, whether as to general principles or special methods, would find himself or herself more perplexed than enlightened.

Miss Oakley's treatise on *Beauty in Dress* (6)—rather upon the practical principles of taste in female costume, the harmonizing of colours and materials, the adaptation of ornaments to complexion and costume, and similar details of the toilet—has at any rate the merit of distinct and dogmatic teaching. The author has no doubt whatever as to the universality of her rules, and lays them

(2) *Report on the Geology and Resources of the Black Hills of Dakota; with Atlas.* By Henry Newton and Walter P. Jenney. Washington: Government Printing Office. London: Trübner & Co. 1880.

(3) *Primitive Industry; or, Illustrations of the Handiwork, in Stone, Bone, and Clay, of the Native Races of the N. Atlantic Seaboard of America.* By C. C. Abbott, M.D. Salem, Mass.: G. A. Bates. London: Trübner & Co. 1881.

(4) *The Philosophy of Carlyle.* By Edwin T. Mead. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(5) *The Dictionary of Education and Instruction: a Reference Book and Manual on the Theory and Practice of Teaching.* By H. Kiddle and A. J. Schem. New York: Steiger & Co. London: Trübner & Co. 1881.

(6) *Beauty in Dress.* By Miss Oakley. New York: Harper & Brothers, 1881.

down with a positive clearness, an absolute conviction, an absence of all doubt or indecision, which will no doubt be comforting to such ladies as have no faith in their own taste, and for one reason or another prefer to depend upon the advice of a book rather than on that of some personal friend, or upon the more usual resource—the fashions they see around them, and the dictation of their milliner. What might be the result of a strict conformity to Miss Oakley's rules, in the case of any individual lady of our acquaintance, we feel by no means certain; and if we knew, which we certainly do not, a lady likely to take such advice with the implicit obedience which the giver seems to expect, we should hardly venture to place the book in her hands lest we should be held responsible for the consequences.

*Woman's Handiwork* (7) is a treatise of much higher pretension and much more general interest. It deals with those decorative arts the pursuit of which is especially and properly feminine—with embroidery, painting, especially on china, fans, linen, silk, and panels, and with the decoration of houses in general. Upon the first topic especially it contains not a little curious and interesting information, describing and exemplifying by a few simple and well-executed illustrations the various forms of ancient and modern work, from the tapestry of the middle ages down to the crewel work of the present year. It will doubtless be of service to many ladies whose taste and inclination for these arts only require the stimulus which such description and information will supply.

Mr. Tredwell's "Plea for Bibliomania" (8) has a somewhat discursive character, and is of extensive rather than general scope. It was originally prepared as a paper for the Rembrandt Club of Brooklyn, setting forth the author's experience in what he calls the private illustration of books, the insertion of original or collected prints and drawings connected with, or explanatory of, the text. From this connective thread the discourse diverges in several directions, generally interesting, because in most cases affording novel and sometimes recondite information, suggestion, or experience.

Mr. Bailey's *Handbook* (9) will, we doubt not, be of service to those who are beginning the very interesting work of a botanical collector. It is, however, distinctly and almost exclusively practical, and therefore little suited to the general reader.

Mr. Brown's treatise on the dangers of sewer-gas (10), its insidious penetration where its presence is least expected, and the means of detecting and repelling its advances, deals with a subject more or less important and interesting to every householder, but one of those with which, unfortunately, individual householders feel themselves almost unable to grapple. The knowledge that any of us may acquire from a work like this, or even from much shorter expositions, of one of the many pests and perils of city life may enable a few energetic people to do a little for their own safety and that of their families; but, as a rule, such knowledge only tends to make the average reader nervous and uncomfortable, without giving him much practical power of helping himself. It is easy to tell us of the nuisances by which the health of dwellers in cities is, or is liable to be, assailed; it is easy to tell us of means by which we may more or less effectually protect ourselves; but the application of these means in each individual instance is apt to be so troublesome and so expensive as to be, for practical purposes, impossible.

Our list is closed by three fictions—*A Fearful Responsibility* (11), recommended by the well-known name of Mr. W. D. Howells; *Patty's Perversities* (12), a story of domestic life, belonging to the "Round Robin Series"; and *Lorimer and Wife* (13), by Miss Margaret Lee, a novelist of some little experience, but one whose name we do not remember hitherto to have seen.

(7) *Woman's Handiwork in Modern Homes*. By Constance C. Harrison. Illustrated. C. Scribner's Sons. London: Trübner & Co. 1881.

(8) *A Monograph on Privately Illustrated Books: a Plea for Bibliomania*. By D. M. Tredwell. Brooklyn: F. Tredwell. London: Trübner & Co. 1881.

(9) *The Botanical Collector's Handbook*. By W. W. Bailey, B.P. (Naturalist's Handy Series, No. 3.) Salem, Massachusetts: G. A. Bates. London: Trübner & Co. 1881.

(10) *Sewer-gas and its Dangers*. By G. P. Brown. Chicago: Janson, McClurg, & Co. London: Trübner & Co. 1881.

(11) *A Fearful Responsibility; and other Stories*. By W. D. Howells. Author of "The Lady of the Aroostook," &c. Boston: Osgood & Co. London: Trübner & Co. 1881.

(12) *Round Robin Series.—Patty's Perversities*. Boston: Osgood & Co. London: Trübner & Co. 1881.

(13) *Lorimer and Wife*. By Margaret Lee, Author of "Arnold's Choice," &c. New York: G. W. Harlan. London: Trübner & Co. 1881.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

#### PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newagent in Town or Country on application to the Publisher.

## THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,352, SEPTEMBER 24, 1881:

Death of President Garfield. Land League Doctrines in Great Britain. The French Commercial Treaty. Lord Justice Bramwell. France and Tunis. Irish Jurics. Indian Railways. Manchester Smoke.

The Damascus of To-day. The Inconveniences of Abduction. Freemasonry. The Electrical Exhibition at Paris. Ancient Egyptian Podagrees. Improvements on Scott. Mounted Infantry. Tactics of the American Protectionists. Recent Racing.

Excavations at Carnae. A Boycotted Household. The Growth of Mountaineering. Letters and Papers of the Reign of Henry VIII. Eugene Onegin. History of the Edinburgh Volunteers. In Spite of Fate. Ford's Merchant Shipping. Lyell's Fancy Pigeons. American Literature.

CONTENTS OF No. 1,351, SEPTEMBER 17, 1881:

Egypt—Irish Manufacturers and Irish Sedition—French Parties—The Trade Unions Congress—London Fish Supply. The Fair Trade Agitation—The Liverpool Cotton Corner—Woes of Railway Travellers.

The Home of John Bunyan at Elstow—The Logic of the Farmers' Alliance—A Plea for Ashburnham House—The Wandering Jew—The "Entombment" at the National Gallery—The History of a Watering-Place—Trade Prospects—The Theatre—The St. Legor.

Brewer's History of Germany—Fairy Tales from Finland—More about the French Police—Douglas's History of China—The Treasury of Modern Anecdote—Bush Life in Queensland—College Plate—Galloway's Scientific Education—A Man's Mistake—German Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

## ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 35 by 25 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DUKE GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde Park Corner, W.

The WINTER SESSION will commence on Monday, October 3, with an INTRODUCTORY ADDRESS by Mr. J. WARRINGTON HAWKINS, at 4 P.M.

The William Brown £100 and £50 Exhibitions are open to all Perpetual Students. The Two Brackenbury Prizes of £30 each, Sir Charles Clarke's Prize, the Thompson Medal, the Treasurer's, Brodie, Arland, Johnson, and General Practitioner Prizes, are open to all Students.

The appointments of House Physician and House Surgeon, of which there are Four, tenable each for one year, are awarded by competition, and no charge is made by the Governors of the Hospital for Board or Residence.

Clerkships and Dressings, and all the minor appointments, are given without extra fees. A Prospectus of the School, and further information, may be obtained by personal application between One and Three P.M., or by letter addressed to the DEAN at the Hospital.

THE LONDON HOSPITAL AND MEDICAL COLLEGE.

Mile and E.—THE SESSION 1881-82 will commence on Saturday, October 1, 1881. FOUR ENTRANCE SCHOLARSHIPS, value £60, £40, £40, and £20, will be offered for competition at the end of September to new Students. Entries on or before September 20. Tests for Lectures and Hospital Practice, 60 Guineas in one payment, or 100 Guineas in three instalments. All Resident and other Hospital Appointments are free. The Resident Appointments consist of Five House-Physicians, Four House-Surgeons, and One Accoucheurship; Two Dressers and Two Maternity Pupils also reside in the Hospital. Special entries may be made for Medical and Surgical practice. The London Hospital is now in direct communication by rail and tram with all parts of the Metropolis.

MUNRO SCOTT, Warden.

ST. MARY'S HOSPITAL MEDICAL SCHOOL, Paddington, W. (Opening of WINTER SESSION, October 3, 1881. Introductory Address by G. P. H. H. Esq., Entrance Scholarships varying in value from £150 to £100.—For further particulars and conditions apply to the DEAN.

A. B. SHEPHERD, M.D.

ST. MARY'S HOSPITAL MEDICAL SCHOOL, Paddington, W. OPEN SCHOLARSHIPS AND EXHIBITIONS IN NATURAL SCIENCE.

The Examinations for 1881 will be held on Monday, October 3, and following days. Candidates are requested to call upon the DEAN at 17 Great Cumberland Place, Hyde Park, on the morning of Saturday, October 1, between the hours of Eleven and One, and to bring with them the necessary Certificates. For further particulars apply to the DEAN at the Hospital, or to

A. B. SHEPHERD, M.D., Dean of the School.

UNIVERSITY COLLEGE, BRISTOL.

The NEXT SESSION will begin on October 10, 1881. The College supplies for persons of either sex, above the ordinary school age, the means of continuing their studies in Science, Languages, History, and Literature. The Chemical Laboratory is open daily from Ten to Five. Arrangements have been made by which Students in the Engineering Department can spend the six summer months as Pupils with various Engineering Firms in and near Bristol. Information with regard to the lodging of Students will be given by the Principal, on application through the Secretary. For Prospectus and further information apply to

J. N. LANGLEY, LL.D., Registrar and Secretary.

THE MASON SCIENCE COLLEGE, BIRMINGHAM. SESSION 1881-82.

I. DEPARTMENT OF SCIENCE AND ARTS.

The SESSION will commence on Monday, October 3, 1881.

Students under sixteen years of age will be required to pass a Preliminary Examination.

II. EVENING CLASSES.

These will commence on Wednesday, October 5, 1881.

The Calendar of the ensuing Session, containing full information as to the aims and objects of the College and the courses of instruction, is now ready, and may be obtained from the Publishers, Messrs. COOPER, BARNARD, Birmingham and Manchester, price 1s.

GEORGE H. MORLEY, Secretary.

**VICTORIA UNIVERSITY, MANCHESTER.**

The PRELIMINARY EXAMINATION of the University will be held at the Owens College, on Tuesday, October 4, and the following days. The Registrar will be present for the purpose of matriculating students, at the Owens College, on Saturday, October 1, from 10 to 12, and on Monday, October 2, from 2 to 4 P.M. Copies of the Regulations, &c., for Degrees will be forwarded on application.

R. ADAMSON, Registrar.

**ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.**

For the Science and Practice of Agriculture.  
For Intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c.  
The R.A.C. Farm, surrounding the College, is a mixed farm of about 500 Acres.  
Chairman of Committee of Management—The Right Hon. the Earl of DUCIE.  
For Prospectus and List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

**TRINITY COLLEGE, London.—A SILVER MEDAL**

is offered by the Academic Board to the Best Student of either sex in the English Literature Class during the Session commencing September 25. Subject: Shakespeare's Coriolanus. Lecturer—Rev. W. A. HALE, M.A.  
Immediate application should be made to the SECRETARY, Trinity College, London, Manchester Place, Manchester Square, W.

**TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.**

The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially appointed for the preparation of the University, Army, and all competitive examinations. Exhibition to the Universities of £40 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Guineas.—Apply to the WARDEN.

**ISLE of WIGHT PROPRIETARY COLLEGE, APLEY**

(near HYDE).

The WINTER TERM will commence on Friday, September 16.  
Full particulars from the Rev. Canon TEESDALE, Head-Master, or the SECRETARY, The Cottage, Melville Street, Hyde.

**THE Rev. J. H. CROSS, M.A.,**

receives a small number of GENTLEMEN'S SONS to prepare for the Public Schools. High testimonials. Great advantages.—Address, 31 Rusey Square, Brighton.

**MILITARY and CIVIL SERVICE EXAMINATIONS.**

There is a Department in connexion with BLAIR LODGE SCHOOL, POLMONT STATION, Strathguthrie, for preparation for the above Examinations. Honours gained during the past year. Three appointments to Woolwich Academy. Seventh Place for Indian Civil Service, &c. &c.—Full particulars on application to the HEAD-MASTER.

**TOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon.,**

is assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

**PREPARATORY SCHOOL, Langley Place, LANGLEY,**

BUCKS.

Mr. W. B. W. COLLINS, late Scholar of Jesus College, Oxford, and for some time Composition Master at Richmond School, Yorkshire, and Mr. LEONARD B. KEYSER, for four years Assistant-Master at the Rev. J. W. Hawtrey's, Aldin House, Slough, receive BOYS between the ages of Eight and Fourteen, to prepare for entrance on the Classical or Modern side of the Public Schools, or for the Royal Navy.

BOYS are also especially prepared for Junior Scholarships at any of the Public Schools.

Langley Place is a few minutes' walk from Langley Station, on the G.W.R.; is four miles from Windsor and two and a half miles from Slough. It stands on gravel soil, above the level of the Thames. The sanitary arrangements are excellent.

References and full particulars will be given on application at the above address.

**PREPARATORY SCHOOL for SONS of GENTLEMEN,**

ST. LEONARDS-ON-SEA. Situation most healthy; sanitary arrangements perfect. Special care of delicate or very young boys. References to Parents of Pupils.—For Prospectus address, Rev. W. HARRIS, Falkland House, St. Leonards-on-Sea.

**MORNING PREPARATORY CLASS for the SONS of**

GENTLEMEN (exclusively), 13 Somerset Street, Portman Square. The OCTOBER TERM commences Thursday Morning, October 6.

**WOOLLEY GREEN, near HURSLEY, HANTS.**

A. M. JEATICOPE, B.A., Oriel Coll., Oxford, prepares YOUNG BOYS for Public Schools, &c. Number under twenty. Two Resident Assistant-Masters. The house is quite in the country, and in a healthy position. Full particulars on application.—Address, Woolley Green, near Hursley.

**AMESBURY HOUSE SCHOOL, BICKLEY, Kent.—This**

SCHOOL, preparatory to Eton, Winchester, Harrow, Charterhouse, &c., RE-OPENS on Monday, September 19. Boys admitted between Eight and Fourteen.—Address, Rev. EDMUND FOWLE.

**DAVOS.—Mr. J. W. LORD, M.A.,**

late Fellow of Trinity College, Cambridge (Senior Wrangler 1875), is desirous of taking a limited number of PUPILS to prepare for Entrance at the Universities, Entrance Mathematical Scholarships, or other Examinations. Terms for the Winter Session (including board), £150.—For further particulars, address Davos, Nordi, Switzerland.

**TUITION at ST. LEONARDS-ON-SEA.—A Married**

CLERGYMAN (M.A. Oxon), without family, has vacancies for PUPILS to prepare for Public Schools or Universities. All former Pupils have passed successfully. Only Three received. Comfortable home a few minutes from the Sea. Highest references.—Address, Rev. R. HOWARD, 7 Church Road, St. Leonard's-on-Sea.

**TUITION.—The Rev. S. BUCKNELL, M.A., Oxford, 1874,**

Rector of Howick, wishes to receive into his house Two or Three BOYS to prepare for the Universities or Public Examinations. The Rectory is airy and healthy position close to the Sea.—Address, Howick Rectory, Leathur, Northumberland.

**EDUCATIONAL HOME for the DAUGHTERS of GENTLE-**

MEN.—THE ORANGE, Emden, HONN-ON-THE-RHINE, Germany. Number of Pupils limited to Twelve. Refined English home. Resident North German and Parisian Governesses. High-class Masters for accomplishments. Unexceptionable references.—Apply as above, to the DIRECTRESS, Mrs. BRUNNEN.

**LADY B. wishes to recommend very highly a SCHOOL on**

the South Coast, where her son has been educated for several years. The education given is thoroughly good and the domestic arrangements are excellent. The Head Master is an Oxford M.A., and a Clergyman.—Address, LADY B., care of Mr. F. Golding, Bookseller, Minster Street, Reading.

**COLLEGE and GRAMMAR SCHOOL, AUCKLAND,**

NEW ZEALAND.—A HEAD-MASTER IS REQUIRED for this Institution. He must have graduated in Honours at one of the leading Universities in the United Kingdom, and have experience and success as a Master in some important Public School. The salary will be £700 per annum, without house allowance, but with a Capitation Fee of £10 for every Pupil paying school fees. £150 will be allowed for passage money to the Colony.

The following gentlemen have consented to act as a Commission for the selection of the Master: Professor Blackie, of Edinburgh; Professor Jowett, of Oxford; Arthur Sidgwick, Esq., of Oxford; and the Rev. J. M. Wilson, Clifton College. Intending candidates can obtain of the undersigned application forms and printed statement giving further particulars as to the School, and conditions of the appointment, &c. All applications must be made on the forms, and be sent in on or before September 30 to WALTER KENNEDY, New Zealand Government Office, 7 Westminster Chambers, London, S.W.

**GOVERNESS-HOUSEKEEPER.—A RE-ENGAGEMENT**

REQUIRED, by a LADY experienced in the duties of both positions, teaching good English, Latin, German, Italian, and Music. Able to prepare Boys for the Public Schools.—Address, A. B., 14 Gloucester Road, Kew, Surrey.

**SEASIDE.—A TUTOR, who takes a small number of Pupils,**

being desirous of adding at once to his numbers, will receive a few PUPILS (Sons of Gentlemen) at greatly reduced terms.—Address, Rev. C. D. H., 2 Salisbury Street, Strand.

**A RESPECTABLE COUPLE, giving up housekeeping, would**

be glad to meet with a SITUATION of TRUST: town or country. A nobleman or gentleman with fishing or shooting box would find them capable of doing all required; have been in good families.—Address, J. M., 7 Bayham Street, Camden Town.

**VIVISECTION.**

THE BEGINNING OF THE END.

The Home Secretary has refused Certificates to Professor Fraser, Dr. Lauder Brunton, and Professor Lister, for carrying on investigations which they declare to be of "the highest value to Medical Science."

GEORGE R. JESSE, *Honorary Secretary, &c.*

Society for the Abolition of Vivisection.

Henbury, near Macclesfield, Cheshire: September 17, 1881.

**REGENTS PARK ROAD.—TO BE LET, on LEASE, or**

the Lease to be sold, on moderate terms, a semi-detached RESIDENCE, in excellent condition, containing three large sitting-rooms, breakfast-room, capital basement, hot and cold water to the top of the house, and gas throughout. Back entrance from garden. Close to St. Mark's Church and Zoological Gardens. Seven minutes from Chalk Farm Station for City, &c.—Apply to Mr. SHAND, Upholsterer, 117 Park Street, Gloucester Gate, Regent's Park, N.W.

**HAMPSTEAD.—SOUTH HILL PARK GARDENS,**

within five minutes of Hampstead Heath Station, N. London.—TO BE LET, a Double-fronted HOUSE, containing fourteen rooms, also bath-room, with a constant supply of hot and cold water. Reception and Bed Rooms most conveniently arranged. Domestic offices on ground floor; good garden at the rear. The house is in thorough repair, most pleasantly situated, and is at present in the occupation of the Owners.—For particulars apply to Mr. DOLMAN, House Agent, 62 Haverstock Hill, and 60 Queen Victoria Street, E.C.

**MIDLAND RAILWAY.—TOURIST ARRANGEMENTS,**

1881.—TOURIST TICKETS will be issued from May 2 to October 31, 1881.

For particulars, see Time Tables and Programmes, issued by the Company.

Derby, April 1881.

JOHN NODIE, *General Manager.*

**PENINSULAR and ORIENTAL STEAM NAVIGATION**

COMPANY.

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA,

CHINA, and AUSTRALIA.

**REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.**

Departures for—

ROMBAY ..... Weekly ..... From Gravesend,  
CALCUTTA, MADRAS, CEYLON, Fortnightly ..... Tuesday, P.M.  
CHINA STRAITS, JAPAN ..... Every Monday,  
ADELAIDE, MELBOURNE, SYDNEY ..... Monday,  
GIBRALTAR, MALTA, EGYPT, ADEN, Weekly, by each of the  
above departures.

LONDON OFFICE: 125 LEADENHALL STREET, E.C., and  
25 COCKSPUR STREET.

**HOTELS.****BRIGHTON.—BEDFORD HOTEL.—Facing Sea and**

Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

BENJN. BULL, *Manager.*

**TOTLAND BAY, Isle of Wight, near Alum Bay.—TOTLAND**

BAY HOTEL. Magnificent sea views. Comfort, with moderate charges. Billiard-room and tennis lawn. Bracing air. Excellent sands and promenade pier. Good anchorage for yachts. Special train and boat service, Friday, 9 to 10 P.M. Returning Monday, 7 A.M.—Apply to Miss FLEMING, Manageress (late of the Langham Hotel).

**ILFRACOMBE HOTEL.—On the verge of the Atlantic, in**

its own Grounds of Five Acres, with Tennis Lawn. Contains 250 Rooms, and is "a model of sanitary excellence." One of the largest Swimming Baths in England; also Private Sea-water Baths.—Every information of MANAGER.

**IMPROVED SPECTACLES.**

SIR JULIUS BENEDICT writes: "I have tried the principal opticians in London without success; but the Spectacles you have adapted suit me admirably. The clearness of your glasses as compared with others is really surprising." Similar Testimonials from Dr. Hodeloff, Consulting Physician, Westminster Hospital; Major-Gen. Spurgin, C.B. Alderhot; Ven. Archdeacon Palmer, Clifton; and hundreds of others. Mr. HENRY LAURANCE, F.R.S., Oculist Optician, personally adapts his improved Spectacles at his residence, 3 Endeavour Gardens, Euston Square, daily Ten till Four (Sundays excepted). Mr. LAURANCE'S pamphlet, "Spectacles: their Use and Abuse," post free.

**FURNISH YOUR HOUSE or APARTMENTS**

THROUGHOUT on MOEDER'S HIRE SYSTEM. The original, best, and most liberal. Cash Prices; no Extra Charge for time given. Large, useful Stock to select from. Illustrated priced Catalogue, with Terms, post free, —248, 249, and 250 Tottenham Court Road, and 15, 26, and 27 Morwell Street, W.C. Established 1842.

**DECORATION.**

MORANT & CO., having for many years carefully studied the best periods of Decorative Art, and having had great experience in carrying out important orders, will advise upon the DECORATION and FURNISHING of TOWN and COUNTRY HOUSES, prepare Designs, and execute the necessary works at moderate cost. MORANT & CO. personally superintend all work entrusted to them.

## SOUTH AFRICAN DIFFICULTIES.

THE account of the deliberations of the Transvaal Volksraad is ominous of trouble. The PRESIDENT, though he was a party to the Convention arranged between the triumvirate and the English Commissioners, has, according to some accounts, invited the Assembly to reject its main provisions. The Convention is not valid until it is ratified by the Volksraad; but the representatives of the Boers were bound both in honour and by express promise to use their utmost exertions to procure the necessary sanction; yet, according to the report, the PRESIDENT informed the Assembly that some of the articles were objectionable, and he expressed a probably unfounded belief that the English Government would, if necessary, modify the terms of the agreement. It is not surprising that the Boers should deem it possible to extort from the present Government any concession, however unreasonable; but even the most zealous party politicians in England would be startled by another step backwards. The Commissioners were supposed to enjoy the full confidence of the Government. Sir HERCULES ROBINSON had been recently appointed to the government of the Cape; Sir EVELYN WOOD had, in opposition to his own avowed opinion, loyally executed the orders of the Colonial Office; Sir HENRY DE VILLIERS had been proposed by the Boers themselves as a friendly or impartial negotiator. Mr. BRAND, President of the Free State, as the professed friend of the people of the Transvaal, had advised them to accept the Convention. The Commissioners were for the most part dealing with the interests, not of England, but of the loyal inhabitants of the Transvaal, and of the natives who form the great bulk of the population. Some of the troops which occupied portions of the province have been, perhaps prematurely, withdrawn; but the best security for good faith on the part of the Boers is the presence in Natal of 12,000 English troops. According to the terms of the Convention, the ratification of its provisions, though the Volksraad was at liberty to withhold its consent, was the condition on which the independence of the Transvaal was recognized. According to the letter of the agreement, the rejection of its terms would permit both parties to the convention in which they were left at the cessation of hostilities. The Boers may probably assume that they are in any contingency secure against the renewal of the war. They perhaps overrate, not the tameness of the present Government, but the endurance of the English nation. Since the arrival of the recent news no Liberal writer has ventured to recommend abject submission.

A less urgent controversy on the politics of South Africa has been, perhaps in consequence of the rarity of current topics, inopportunistically revived by the *Times*. That remarkable journal, though it has sometimes been accused of inconsistency, has for many years taken every opportunity of endeavouring to weaken the relations between the colonies and the mother-country. Some plausible arguments may be urged in support of a doctrine, openly professed by a few political theorists, that the dissolution of the Empire would tend to the diminution of expense, of trouble, and of risk; and it is natural that those who hold an unpopular opinion should defend it on all convenient occasions. Complaints of the burden incurred by the retention of the colonies are less intelligible when they are preferred by professed advocates of the maintenance of the Empire. If the connexion with the colonies is not

to be renounced, it may as well be cordial and friendly. There is no public advantage in reminding colonists from time to time of sacrifices undergone on their behalf, or in warning them that they must hereafter provide for their own defence. It is well known that the inhabitants of the great outlying provinces are at the same time sensitively jealous of their independence, and proud of a connexion which implies no inferiority. They resent with equal vehemence supposed encroachments on their cherished rights, and expressions of indifference to their claims on the sympathy of their countrymen at home. Every prudent statesman will be disposed to humour their sentiments, even when he may secretly deem them inconsistent. A journalist in want of a subject, even in the depths of September, might advantageously select some less delicate occasion for the exercise of his ingenuity. The *Times* could scarcely have chosen a more inappropriate text for its customary discourse than the recent transactions in South Africa.

Mr. SPRIGG, lately chief Minister at the Cape, probably expresses the feelings of his fellow-colonists in his complaint of the injustice which has been done to the community which he lately ruled. The commonplace grievance of being compelled to bear the risk and cost of defending distant possessions is wholly inapplicable to the circumstances of the Cape during the last two or three years and under Mr. SPRIGG's administration. It is extremely doubtful whether the Colonial Government was well advised in resolving to disarm the Basutos. Mr. SPRIGG contended that the natives had no use for arms, except for purposes of rebellion, inasmuch as they had no hostile tribes to deal with, and as there was no large game in the country. He consequently insisted on the surrender by the Basutos of their firearms, while he at the same time offered to grant licences to bear arms on certain conditions. The chiefs not unnaturally objected to a measure which involved both an indignity and a diminution of their power of resisting possible aggression. The insurrection which Mr. SPRIGG had hoped to render impossible immediately broke out; and the war which ensued involved much expense and considerable loss of life. Among other untoward incidents of the struggle, the Dutch inhabitants declined to take their full share of military service; and on several occasions the colonial forces suffered mortifying checks. After a considerable time the native chiefs became convinced that they were weaker than the enemy, and consequently they at last agreed to terms which were in the nature of a compromise. The tribe is not effectually disarmed; but it will be disposed, after late experience, to keep the peace for the present. The Colonial Government nominally retains the right of disarmament; but licences will be granted on easy terms. It is but fair to admit that for some years past the Cape Government has, on the whole, behaved with justice and liberality to the coloured race. It is desirable that its merits should be fully recognized, especially as it would have been difficult to protect native interests if the local policy had been harsh and oppressive.

The relations between the Imperial Government and the colonies are more relevant to the present discussion than the policy or the circumstances of the Basuto war. Lord Kimberley at first disapproved of Mr. SPRIGG's enterprise; and on several occasions he reserved the right of the Crown to protect the natives, if necessary, against an

unjust settlement. The Colonial Government, on the other hand, maintained in its official language, and still more forcibly by its acts, the purely local character of the dispute. Mr. SPRIGG is the head of the party in the colony which professes the strongest attachment to the English connexion; but no colonial patriot could be more determined to assert the exclusive right of controlling its own affairs which had been conferred on the Cape six or seven years ago. From the outset of the dispute the Cape Ministry announced their determination not only to abstain from application for Imperial aid, but to reject the services of the QUEEN's troops, if they had been offered. On the other hand, Mr. SPRIGG asserted the right of the colony to settle its quarrel with the Basutos according to its own views of expediency and justice. If the Home Government had attempted to revise the conditions of the treaty which was ultimately concluded, there is no doubt that its pretensions would have been rejected. There has happily been no occasion to engage in a conflict which might have caused much bitterness of feeling, and which would probably have ended in favour of those who were on the spot. The natives have suffered no injustice; and the war has not cost the English Treasury a single farthing. It must have been not a little irritating to the late Minister of the Cape to find the South African colonies indiscriminately reproached with their assumed dependence on Imperial resources. It was difficult for the most infallible of journals not to defer to his remonstrance. It is now admitted that the Cape is an exception to a rule which applies to the minor provinces, all of which are Crown colonies. It is true that Natal and Griqualand must be protected as long as they are only inhabited by a sparse English population. In Natal the colonists bear to the natives the proportion of one to twenty; and it is at once necessary to defend the weaker party, and advantageous to both that their rights and interests should be protected by an impartial authority. As long as Englishmen are disposed to settle in distant lands it is right that they should be followed by English law and English power. It is in this way that their race and language has spread over the world; and the abandonment of a traditional policy would be at the same time foolish and base. The colonies are willing enough, as they successively become strong and populous, to undertake the burden of conducting their own affairs. In the meantime it is unbecoming and unwise to taunt them with the benefits which they now receive from the mother-country.

#### EGYPT.

FOR the moment there is a lull in the affairs of Egypt, and even a tendency to improvement, as a negro regiment has kindly consented to banish itself from all the pleasure and excitement of its capital on a sufficiently handsome sum being given for its travelling expences. But the crisis is not at an end, and as no one can foresee what its end will be, a host of advisers have come forward to suggest what is the shape which, in the interests of England, this end ought to be made to assume. Before, however, any serious attempt to say what ought to be done, it is useful to have as clear a notion as possible of what cannot be done, or ought not to be done, or what, if it must be done, can only be done with the greatest reluctance on the part of English statesmen. As the present danger comes from the Egyptian army, it is suggested that the right thing to do is to get rid of the Egyptian army altogether. In one sense Egypt could do perfectly well without an army. As Sir CHARLES DILKE said, what Egypt wants is not an army, but a gendarmerie, or, as we should call it, a good police force. The peasants of Egypt give no trouble to any one, and crimes of violence are almost unknown in country districts. Some kind of police is necessary, if only to give effect to the decisions of the local tribunals, and to prevent disputes about land ending in village riots. Beyond this a coherent disciplined force is necessary for three purposes—to keep order in Cairo and Alexandria; to guard against religious excitement leading to civil disturbance, especially in the case of the Mecca pilgrims; and to make it impossible for any one having local authority to set up for himself when ordered to relinquish office. A small force would suffice for these purposes, provided it was thoroughly disciplined, and at

the absolute disposal of the central authority; and it would be a matter of perfect indifference whether this force was called an army or a gendarmerie. But all this is only true of Egypt proper. Beyond Egypt proper lie the wild lands which were mainly annexed by the late Khedive, and only very imperfectly reduced to obedience. Military force must always be present, or there would be complete anarchy. By the constant use of military force something has been done, and is being done, to put down the slave trade. Not nearly so much has been done as ought to have been done, but still something has been done, and England has been unceasing in pressing Egypt to do more. To do away with so much of the Egyptian army as is required for this purpose would be to restore the Red Sea slave trade in its full horrors, to undo all that England has yet accomplished towards its suppression, and to make it impossible that England should do anything in future towards effecting an object which we profess to have very nearly at heart.

As the readiest means of putting down the present insubordinate army of Egypt, it has been suggested that Turkey should send soldiers to Egypt. It is impossible to say that circumstances might not arise in which the employment of Turkish troops might be the least of many evils. But it would be a very great evil in itself. The very reasons which make Turkey long to be allowed to send troops to Egypt are reasons why the Western Powers must dislike Turkish troops being sent. To the Porte nothing would be so fascinating as the prospect of getting its troops into Egypt. In the first place, it would be a conspicuous assertion of the pretensions of the Caliphate. It would be treated by the Mahomedan world as a set-off for the rebuff which Turkey has had to undergo in Tunis, and might easily constitute so great an addition to the many difficulties which France has to encounter, that the French Government would not consent to it, except under pressure, which would strain, if it did not break, all friendly relations between France and England. In the next place, the Porte wants to get its troops into Egypt as a means of securing a position of advantage in the great struggle between Turks and Arabs which, in a mild form, is always going on, and which may before long take a form of a very acute kind. To dominate a now Arab population, and, at the same time, to hold all the west coast of the Red Sea, would seem to the Turkish Government an excellent stroke of business. Then, again, there are some exceedingly pleasant pickings to be got out of Egypt. To get hold of a country that actually pays its way would be like a green spot in the desert to pashas and generals who for years have seen nothing but universal bankruptcy. To get the Turks into Egypt would be easy enough, but to get them out would be very difficult indeed. They would take care not to do their work too quickly or too well. There would always be some danger from the disbanded army, against which they would have to take precautions equally indispensable and expensive. If it was proposed to replace them, they would ask how they could be replaced when an Egyptian army could not be trusted and no European Power would intervene except on paper. They would naturally ask that the province they were saving should pay them for their trouble, and they would get what they asked by the simple process of taking it. They would probably be too prudent to take more than they could take without coming to an open quarrel with the Powers that had invited them to come in; but their plea that Egypt must pay for being saved would, if urged within decent limits, be so irresistible that they would easily take enough to disorganize Egyptian finance and arrest the progress which Egypt has recently made. That the Arabs would reflect that this was a most disappointing end of French and English protection, and that Mr. GLADSTONE's Government would give the most curious of whitewashings to the Turks by putting under their unspeakable pashas and generals a province hitherto free from them, may perhaps be dismissed as mere matters of local or personal sentiment.

As an alternative process it has been suggested that Egypt should be proclaimed an independent country with the guarantee of England. There is no difference between this and the bolder plan of an English occupation or annexation, except that it has the merit or demerit of a very thin veil of hypocrisy. Egypt is now dependent in three ways. It is under the suzerainty of the Porte, it has its finances controlled by foreigners, and it is bound

to administer justice to foreigners in a peculiar way, which foreigners find convenient to them. As regards foreigners, England must guarantee that independent Egypt should offer them all the advantages offered by dependent Egypt. She would have to take care that the new Egypt paid the debts of the old one. She would have to see that the proper taxes were properly collected, and that every possible check was applied to prevent corruption and negligence. She would have to ensure that the International Tribunals gave no judgments that were not punctually carried out. In order to do all this she would have to make the independent Government do exactly what England thought right, and the independent Government could only be kept from going wrong by the constant display or the constant menace of English force. If Europe did not know previously, it has learnt from the recent history of Tunis, what is the inevitable end of this sort of mock independence; and, if we are to do a strong thing, we may at least ask to be spared the humiliation of having to stoop to the subtleties of M. ST. HILAIRE. As regards the Porte, it is supposed that we are to inform it that its suzerainty is at an end, with the sole justification that our Indian interests make us think this necessary. We presume that what was sauce for us would be sauce for our neighbours, and that there would be no objection to France informing the Porte that its Algerian interests required that the suzerainty of the Porte over Tripoli should be a thing of the past. Other nations would find that their interests required that they should have something else, and the great process of partitioning Turkey would be set on foot; and this time it would be England, of all nations, that would have had the honour of beginning it.

#### THE DEFEAT OF AYUB.

THE restless wheel of Afghan fortune has taken another turn, and the AMEER, whose chances not so very long ago looked dark enough, is once more in the ascendant. It was not unnatural that, after the battle of Karez-i-Atta, the prospects of AYUB should have been highly thought of in this country. He had been twice victorious in the same district—once over our own troops. His defeat by Sir FREDERICK ROBERTS had been, according to the ordinary reckoning of Orientals, in a manner wiped out by our neglect to pursue our success and to take vengeance for the murder of Lieutenant MACLAINE. He was the representative of what is, on the whole, the most popular branch of the Afghan reigning family, and he had shown decidedly more generalship than his rival. These advantages, however, were neutralized—partly by his own hesitation in improving his victory; partly by his inability to enlist the support of the Ghilzais; most of all, perhaps, by the incurable habit of treachery which seems to be inherent in Afghan regular troops. An Afghan disclaimer against standing armies would certainly be at no lack for arguments. Judging by history and experience, the first thought of the regimented Afghan soldier is, if he is fighting against Europeans, to run away; if he is fighting against his own countrymen, to desert. There can, moreover, be no doubt that AYUB committed a grave error by placing the troops of whose fidelity he was most doubtful in the rear, though it is of course possible to understand his reason for doing so. For, as the Afghan regular is chiefly remarkable for treachery, so the Afghan soldier, regular and irregular alike, is remarkable for his extreme sensitiveness to the presence of an enemy in the rear. It does not appear that any great execution was done by the sudden action of the Cabuli regiments in firing on the troops posted in front of them; but the fact of the firing was sufficient to lose the day, which was after all, a comparatively bloodless one. The AMEER has been blamed for permitting the looting of Candahar. But it would probably have been impossible for him to prevent his Ghilzais, to whom he was chiefly indebted for the victory, from indulging an hereditary animosity. Not much fear need be entertained for the Hindoo and Farsiwan merchants of the town, for, by all accounts, most of them had the good sense to leave the city when our abandonment of it rendered it no longer a safe place of business or of abode.

The battle and its results are additional lessons, if

any such were required, of the extreme caution necessary in estimating the chances of Afghan war and politics. In so far as the victor in this case is the nominee of the English Government, while AYUB during his recent stay in Candahar affected to be bitterly hostile to us, the result is satisfactory. But it has frequently been pointed out that the special circumstances of civil war in Afghanistan at the present time are such as to make almost any event capable of giving us trouble. At the present moment, as far as is known, AYUB is either a beaten fugitive at Herat, or, as is more likely, unless he has used extraordinary speed, is on his way thither. He has already sent to his capital supplies of men, money, and guns; and, unless the inhabitants turn against him, his refuge there will be pretty secure, inasmuch as the huge earthworks of Herat are impregnable to an Afghan army. There is, it is true, an emissary of the AMEER's somewhere in the western provinces who may give AYUB trouble on his road; but it is not known that he has any great force with him. Supposing, then, that AYUB reaches Herat in safety, the AMEER will have to make up his mind either to leave him there, in which case the proceedings of this year and last year will pretty certainly be repeated—for defeat is no more fatal to an Afghan claimant than victory is decisive in his favour—or, satisfied with the North, East, and South, he may be content to leave AYUB some sort of nominal supremacy in the West. Or he may advance on Herat. This latter would, as has been said, be a very formidable undertaking, though no great resistance might be offered to the invaders on the way either in Zemindawar or Farrah. In any case, however, the danger, as far as English interests are concerned, lies not so much in what may happen to the AMEER as in the fact that AYUB's misfortunes are almost certain to throw him into the arms of Russia. The Russian and the English Governments are on the best of terms at present, no doubt. But this cordial understanding apparently rests upon two other understandings—that England shall make no advance westward, and that Russia may make any advance eastward she likes, with a hazy reservation as to Herat itself. It is not immediately to be feared that AYUB would offer to put the Russians in possession of that city, or that they would accept his offer. Near as they are, they are not yet quite near enough, and even the genial atmosphere of mutual admiration and esteem which prevails between Lord GRANVILLE and M. DE GIERs might be disturbed by such a proceeding. But what is most probable is, that AYUB will take the place in reference to Herat which ABDURHAMAN used to occupy in reference to Afghan Turkestan; that he will be a refugee guest at one of the Russian proconsular courts, entertained nominally as a matter of generosity and sympathy with the fallen, but really as a possibly useful instrument in case of future contingencies. Hitherto AYUB has not, as far as is known, had much dealing with Russia, but there was no reason why he should have much or any. The reason now exists, and though it cannot be said that his residence at Tashkend would be a matter for serious alarm, it would, considering the actual condition of affairs in Central Asia, be, to say the least, an inconvenience.

What that condition is may be very simply stated. It is a steady, persistent violation of the famous pledge on the faith of which the House of Commons was induced to sanction the evacuation of Candahar. So far from operations in Turkestan having been put a stop to, they have not rested for an hour. The enormous encroachments on Persian territory in the direction of Meshed, of which the *Daily News* Correspondent at Merv was the first to give positive intelligence, are not, indeed, fully consummated; but the Russian claims have certainly not been withdrawn, and they are being strenuously advocated in print as well as diplomatically. Meanwhile the Trans-Caspian Railway proceeds with the utmost rapidity. The most difficult part of the route has been accomplished, the foot of the Akhal district has been reached, and the continuation to the Russian outposts beyond Askabad is a matter of no difficulty, and probably of very little time. From thence by the proposed, if not completed, annexation of Kuchan the way to Meshed is easier still; and that Meshed means Herat is acknowledged even by fervent supporters of the Government policy in Afghanistan. It is, therefore, no wonder that, on the singular principle which makes some critics insist upon England drawing back a step for every step that Russia

makes forward, the abandonment of the posts of observation which yet remain to us south of Candahar is clamoured for. Meanwhile, it is well to take notice of the fact which has been made known by the most recent of Mr. O'DONOVAN's interesting and important letters from Central Asia, that little, if any, expectation of serious opposition to Russia in those quarters can now be entertained. Merv would indeed still resist; but Merv has been, so to speak, masked and rendered of no importance by the recent occupation of Akhal, and still more by the encroachments on the Attrek and towards Meshed. Here, according to that most competent and unprejudiced observer, the very Kurdish chieftains, who form a kind of military frontier to Persia, are in favour of Russia, and respond enthusiastically to the toast of the Czar's health. Iest it should be said that a Kurdish chieftain would probably respond enthusiastically to any toast, it may be added that that of the Empress of India is coldly received. There has, indeed, long been little doubt that in North-Western Persia the Russians are regarded much more as deliverers from the intolerable nuisance of Turcoman raids than as invaders or conquerors. It is usual to meet all this by saying that, if so, so much the more to the credit of Russia as a civilizing Power. In short, "the young man is an honest man." It may be so. But, civilizing Power or uncivilizing Power, it has been a steadfast principle of all English politicians who know anything of India that Russia cannot, without danger, be allowed to come near Herat. The fact now is that she is advancing towards Herat literally at railroad speed, and that circumstances on the Afghan side of the frontier are more favourable to her than ever.

#### AMERICA.

OF the many speeches which have been made in honour of Mr. GARFIELD, Mr. LOWELL's was perhaps the best. The American Minister necessarily took the principal place at a meeting of his countrymen in London, and it was fortunate that they were represented by a master of English style and language. Although Mr. LOWELL had not been intimately acquainted with the late PRESIDENT, he had in two or three casual interviews recognized his ability and the genuineness of his character; and he appreciated the peculiar merits of his career with a thorough knowledge of the circumstances and qualities of the highest class of adventurous Americans which can scarcely be possessed by a foreigner. The manner in which the mention of the QUEEN's name was received is to Englishmen one of the most gratifying incidents of the meeting. Although it would be absurd to anticipate great political results from the sentiments which are elicited by an extraordinary occasion, it really seems possible that recent demonstrations of sympathy may tend to promote friendly relations between the two countries. The American people have, with a fine perception of fitness, accepted the QUEEN's letters and messages as the proper representation of English regret and good will. Personal feeling is always best expressed by a single person; and in matters of this kind the QUEEN never fails in one of her most gracious duties. The general suspension of business and the emblems of mourning in London and other principal towns, and the addresses which were delivered on Sunday last from innumerable pulpits, will produce a favourable impression in all parts of the United States.

The hundreds of thousands, perhaps the millions, of mourners who, as it was with a pardonable hyperbole asserted, formed a line on either side of the funeral procession for six hundred miles, would perhaps have been less deeply moved by the tragedy if its subject or hero had been a more famous man. A year and a half ago Mr. GARFIELD's name was unknown in England and on the Continent of Europe; and no one in the United States would have placed him in the first rank of statesmen. He might, perhaps, not have become the Republican nominee for the Presidency if he had been conspicuous enough to excite the jealousy which has been fatal to a long succession of eminent candidates; but when it appeared that the chief political leaders were only strong enough to exclude each other from nomination, the selection of an able and honest member of the Legislature, who had in his youth done good service as a soldier, afforded relief and satisfaction to the sound portion of the Republican party. The popular attachment and admira-

tion which have lately been exhibited have derived much of their fervour from the well-founded belief that the murdered PRESIDENT was a typical American citizen. In the Southern version of *Cherry Chase*, the superiority of England is asserted in the King's confident declaration that he has still within his realm five hundred captains as good as PERCY. The resources of Scotland are by the same patriotic poet supposed to have been exhausted with the death of DOUGLAS. Every true American feels justly confident that there are within the States five hundred as good as GARFIELD. Many aspirants to the highest honours are now undergoing a similar training. It may be hoped that none of them will be required to serve their country in civil war. They will try their youthful strength in local elections and in the Legislatures of their respective States; and some of them will attain to seats in Congress, and perhaps ultimately in the Senate. They will do well to emulate, in dealing with the questions which may arise in their time, the sagacity and honesty with which Mr. GARFIELD resisted all proposals to tamper with the currency by a depreciated circulation either of paper or silver. They will not escape the economical delusions which he shared with his party, unless, indeed, the protection of indigenous monopolies should pass out of fashion. Mr. GARFIELD seems to have thought that he was a free-trader because he hoped that at some future time foreign imports would be excluded, without the aid of tariffs, by the greater cheapness of domestic production.

Among the most interesting illustrations of Mr. GARFIELD's character which have been published are the anecdotes which show his hearty love of literature. He was a respectable scholar, though he was probably not familiar with the niceties of academic study; and he had a genuine love both of learning and of light literature. Like a child who reserves the most tempting morsel to the last, he read the earlier chapters of the *Pickwick Papers* again and again, but he never could bear to finish the book, wishing always to have the pleasure in prospect. The whimsical fancy would not be unworthy of a man of genius, and it indicates the temperament of a genuine student. No worldly or selfish man would have been inclined to cultivate such a form of humorous weakness. The fortitude which he displayed during his long decline excites a graver feeling of respect and sympathy. As Mr. LOWELL happily quoted from ANDREW MARVELL—

He nothing common did or mean  
Upon that memorable scene.

His bodily sufferings may probably have diverted his thoughts from the regret which might otherwise have been suggested by the loss of great opportunities. Having attained the highest object of personal ambition while he was still in full vigour of mind and body, he may reasonably have expected to found a great reputation. According to a doubtful anecdote, he once asked during his illness whether his name would live in history. If the story is true, he probably reflected that his name would only be remembered in connexion with his unfortunate end. It may be conjectured from the tenor of his political career that he would as President have devoted himself to the extirpation of the corrupt practices and vicious tendencies of the existing system of patronage. It was not his fault that the work was not even begun.

It must be assumed that Mr. LOWELL had sufficient grounds for the confidence which, with official propriety, he professed to feel in the ability and integrity of the actual PRESIDENT. Mr. ARTHUR would not have been sufficiently prominent in his section of the Republican party to be selected by Mr. CONKLING for the office of Vice-President, if he had not been an active and able politician. It is satisfactory to receive the assurance that he bears a high reputation for honesty and patriotism; and it may be confidently anticipated that he will exercise his high functions with a sincere desire to promote the public good. A President is almost as completely identified in personal interest with the Republic as an hereditary King. He has nothing to gain for himself, except perhaps the chances of a second term; and it is not likely that a casual successor to the Presidency will be a candidate for re-election. It happens at present that the maintenance of the President's prerogative affords the best security for the honest disposal of patronage. The Senators who have in late years usurped the right of appointment to lucrative offices have to provide for their own partisans, and sometimes their relatives, out of a comparatively small number of places. The President, even if he were disposed to

satisfy private claims, would soon exhaust the host of pretenders to his personal favour. At this moment there is a tendency to support the President against any competitors in other departments of the Federal Government; and the enthusiasm with which the memory of Mr. GARFIELD is cherished will to a certain extent strengthen the position of his successor. It is not forgotten that when he received the fatal wound Mr. GARFIELD was engaged in a struggle with a formidable opponent who professed to assert the claims of the Senate. Mr. ARTHUR's most popular course will be to maintain his constitutional rights. He seems to have begun his administration with good feeling and good sense. There can be no doubt that his regret for the cause of his elevation was sincere; and he is in no hurry to divert attention to himself. The Senate will shortly hold a Session for the purpose of receiving the nominations which may be made by the PRESIDENT. In the meantime he has not announced any change in the constitution of the Cabinet, though changes are still confidently predicted, and he judiciously advises his Ministers to take a holiday after the prolonged tension to which they have been exposed. As the PRESIDENT justly says, there is no pressing need of legislation, and there is no reason for accelerating the meeting of Congress.

#### LORD SPENCER ON FARMING.

WHEN Lord SPENCER talks to farmers about farming he speaks with various titles to a respectful hearing. He is a Cabinet Minister; he is charged with the department which controls important farming operations, and he represents a family which has for many years made itself conspicuous in the region of agricultural improvements. He dismisses in a few emphatic sentences the wild notion that the farmers may hope to right themselves by a return to Protection. Business men have something better to do than to run after a phantom, and no phantom could be more shadowy than the notion that the large towns will allow the price of bread to be artificially raised. What landlords and farmers have to do is to set themselves seriously to consider the causes of the present condition of agriculture, and to study how far these causes may be expected to cease to operate, or how far they can be counteracted in future. Like all competent judges, Lord SPENCER treats as the primary cause of agricultural distress the remarkable succession of wet seasons. If we look back over the history of England for any length of time, there is nothing extraordinary in this period of bad weather. There have been many periods of weather, not only as bad, but much worse, and as there is no kind of reason for thinking that the climate of Great Britain has permanently changed, it may be confidently predicted that bad seasons will be followed by good. The present period of bad seasons, however, may be attended with some peculiar consequences. It has come after a period of good seasons in which the general trade of the country had made enormous progress. Rents had risen, and they had risen not because landlords were extortionate, but because they had an article to dispose of for which there was a brisk market. It has also come at a time when there has been a considerable increase in local rates, which it must be remembered fall ultimately on the landlord, but only fall on him when the farmer, on whom they first fall, has managed to shift the burden from his shoulders. It has further come when for the first time English agriculture has to face American competition. And, lastly, it has come when English farming is not by any means what English farming ought to be. It was to this last topic that Lord SPENCER principally directed the attention of his hearers. The sun may again shine, but it will not shine on a prosperous agriculture in England unless English agriculture undergoes the improvement of which it is susceptible.

The first thing that English agriculturists have to do is to study, by the light of recent experience, the inherent capabilities of the soil. Up to the present time two mistakes have been committed. The soil has been regarded exclusively as it is under a succession of fairly dry seasons, and land has been put under cultivation which is not worth cultivating. When the uninstructed public hears of agricultural distress, it is apt to think that this distress is universal. On the contrary, there is a large—a very large—part of English land where there is no agricultural distress at all. The Duke of DEVONSHIRE

has just refused a reduction of rents on one portion of his estates for the very sensible reason that his land is worth as much in the way of rent as it ever was. The Duke of CLEVELAND has refused a similar demand, and has added that, if his farmers doubt the justice of his calculations, they may have their farms valued. There are many parts of England—as, for instance, in the small cattle farms of Wales—where the wet has done no harm, and there are few counties in which the land that has not been seriously injured by the wet is not of greater extent than the land which has seriously suffered. It has, however, been shown that there is a considerable portion of English land which suffers severely in wet seasons; and the farmer will henceforth, unless he is unusually reckless, only offer for such land a rent which he can conveniently pay on the average of seasons, wet and dry.

There is also some land, although only a very small part of the whole mass, where losses in bad seasons cannot be repaired in good seasons, or which is so sterile that it will not grow crops at all; and this small portion of English land must go out of cultivation. The next thing that the agriculturist has to do is to avert, so far as he can, the evils of wet seasons by drainage. Lord SPENCER repeated, what is abundantly shown by the evidence taken before the RICHMOND Commission, that the present system of English drainage is a hollow mockery. Landlords have borrowed large sums for drainage; but neither they nor their tenants have seen that the works were perfectly carried out. Millions have been spent on drains that do not drain. Lastly, English farmers have got, in many respects, to learn their business. They have to ascertain by experiments often costly, and too often hazardous, to what new uses the soil can be turned in order to supply the home market with produce which cannot be brought from a distance. It is no fault of theirs that they have not got this knowledge already. It is foreign competition, acting in directions perfectly new to them, which now makes this knowledge necessary. But foreign competition has revealed that there are not only new things to be done, but old things now done badly which must be done well. Through a large part of England the people who keep cows do not know how to make butter. Instead of making good butter, they make bad. The RICHMOND Commission had to listen to the story of a large contractor for railway refreshment rooms, who began with the patriotic resolution to buy none but English butter, but found that the only English butter he could buy was so bad that he had to import his butter from France.

The question naturally arises, if all these improvements are to take place, what is to be the relation between landlord and tenant? Rents will necessarily fall to the level at which it will pay the farmer to cultivate. All burdens will in time fall on the landlord, and the landlord will have to execute those permanent improvements, such as drainage and the removal of superfluous timber, which must be executed if the land is to be let to a responsible tenant. All this is simple enough; but when a farm in fair order is let at a fair rent, what is to be the subsequent relation of the parties? How long is the tenant to be allowed to hold the land, and how long is he to be forced to hold it; what may he do with it while he holds it, and what is to be his position when he ceases to hold it? The tenant is going to try a number of experiments—the experiment of what the land will produce in good seasons and bad seasons, the experiment of the new uses to which it can be turned, the experiment of the new skill which he can import into the management. He naturally wishes to have the freest scope for his experiments that he can devise. He desires more especially three things—that he should be left uncontrolled to make any experiments he pleases; that he should be allowed to hold the land if his experiments succeed, and throw it up if they fail; and that when he goes away he should be repaid the sum by which the land through his experiments has been made a more advantageous field for the experiments of his successor. The landlord replies—that the experiments of the tenant may ruin, not only the man who makes them, but the land on which they are made; that he must reserve the power of getting rid of a man who makes foolish experiments; and that the unexhausted improvements at the end of a tenancy are to be judged as to their value by their intrinsic merit, and not by what the tenant has chosen to spend on them. There can be no doubt that, if the parties were in a position to make nothing but a fair bargain, the landlord would

always agree to give the tenant the intrinsic value of unexhausted improvements—partly because it is obviously just, and partly because the land suffers if no improvements are left unexhausted in the latter years of a tenancy. But the remarkable thing is that the tenants, or at least a portion of them, do not want to treat their relations with the landlord as one of bargain at all. They want the law to help them. They think of the best bargain which they could make with a landlord who was longing to get a tenant on any terms, and propose that the law should enforce this contract on all landlords without distinction. This is the simple meaning of the draft Bill which a body of Scotch farmers has been good enough to arrange for the consideration of Parliament. The tenants who propose such schemes are, in fact, more anxious to be the tenants of their landlord than their landlord is to have them as tenants. They are thus in a position of inferiority when they come to make a bargain, and they ask Parliament to turn the balance in their favour. To the argument that this would be inequitable, they reply that they do not know whether they have equity on their side, and do not much care, but that they fancy that they have something much stronger than equity to support them, and that is electoral power. It is at the polling-booths, and not in a lawyer's office, that they propose to make their bargains for the future.

#### RUSSIA AND AUSTRIA.

THE secret of the meeting of the Emperors of RUSSIA and AUSTRIA, if indeed any such meeting is proposed, has been hitherto well kept. Active controversy on a probable matter of fact is more puzzling than mysterious silence. If nothing had been said on the subject after the interview had once been announced as probable, the official silence would have been attributed to a reasonable wish that the time and place of meeting should not be communicated to possible conspirators. The discussion which is continued in the journals of different countries perplexes those who are anxious on the subject. The Vienna papers for the most part declare that the EMPERORS are to meet, while the report is contradicted at Berlin and Petersburg. The only inference which can be drawn from a comparison of conflicting statements is that the present relations between the two Imperial Courts are sufficiently friendly to render an interview feasible if it is deemed expedient. It might almost be supposed that there was no necessity for a public demonstration of amity which has been already established; but there may be reasons for an interview which are not generally known. A sudden intimation that the two great potentates had actually met at some convenient place would cause no surprise. Speculation on the motives and circumstances of the interview would supply the place of conjectures as to the probability of the occurrence. In the meantime the chances seem to be in favour of the opinion which prevails at Berlin. The Emperor ALEXANDER would have to undertake a long journey from Moscow to the Austrian frontier; and Nihilist assassins would perhaps find better opportunities on a railway than in an Imperial palace. There is reason to believe that the question whether additional precautions against regicide can be devised was mentioned during the Dantzig interview. The Russian and Austrian Governments may, if they think fit, concert measures for the purpose without the personal intervention of the Sovereigns.

The importance which is attached in the great Continental monarchies to Royal and Imperial interviews is not the less real because it is but partially intelligible to English observers. It is certain that in many instances a formal display of dynastic intimacy has indicated serious political combinations. The unexpected proposal of ALEXANDER III. to meet the German EMPEROR at Dantzig removed the impression that he was disposed to abandon the family alliance which had been carefully cultivated by his predecessor. The renewal of former friendship has been further commemorated by the calculated indiscretion of a Hungarian newspaper. There is no doubt of the authenticity of the published documents, notwithstanding the remarkable statement that the moderation of Prince BISMARCK was unexpected.

The report of another Imperial interview naturally suggested the probability of a revival of the so-called League of the three EMPERORS. The professed object of their former alliance was to preserve the peace of Europe,

and especially to render impossible a war between France and Germany. It is not fully known whether the Austrian Government was a party to the understanding between Germany and Russia which afterwards resulted in the invasion of Turkey; but the original insurrection in Herzegovina was fomented by Russian agents, and the subsequent acquisition of Bosnia was probably the result of an earlier arrangement. The League was dissolved in consequence of the imperious demeanour of Prince GORTCHAKOFF; and Prince BISMARCK substituted for the triple alliance a close connexion with Austria. If a third partner is again admitted, the future policy of the three EMPERORS will be anxiously watched. It is not probable that they will for the present be disposed to promote schemes of aggression. The final disruption of the Turkish Empire in Europe will probably be deferred to a future period. The Emperor of RUSSIA is not likely to engage in warlike enterprises, and Austria will not be encouraged by Germany to disturb existing arrangements. All three Governments probably regard with complacency the prosecution of the French enterprise in Northern Africa. The war in Tunis provides security while it lasts against ambitious projects in Europe. It is possible that the re-establishment of friendly relations among the three great military Empires may be harmless to their neighbours and beneficial to themselves. No part of Prince BISMARCK's policy has been more generally approved by his countrymen than his cultivation of a close intimacy with Austria. The alliance serves in general estimation as a substitute for the union of all German lands under one Government, which is at present neither desirable nor practicable. It has been felt that, as long as the same policy was pursued at Berlin and Vienna, no danger was to be apprehended either in the East or in the West. The family connexion with Russia has often excited uneasiness; and the renewed friendship which may have been cemented at Berlin would have been regarded with suspicion and dislike if it had involved a coolness between Germany and Austria. An interview held at this time between the Russian and Austrian EMPERORS might tend to relieve any anxiety which may have been excited by the meeting at Dantzig. The publication of the statement that the satisfaction of the Emperor ALEXANDER with the policy of Prince BISMARCK had been communicated to Baron HAYMERLE was probably intended to prove that the alliance between Berlin and Vienna was still unshaken. The Austrian Government may be trusted not to abandon its best security against external dangers.

The chronic antagonism between Austria and Russia may be indefinitely suspended, if the Emperor ALEXANDER distinctly renounces the Slavonic policy which he was supposed to favour during his father's lifetime. The turbulent theorists of Moscow have again and again exerted themselves to promote disaffection in a large portion of the Austrian dominions. In former generations ALEXANDER I., and at a later time NICHOLAS, cultivated the goodwill of the Hungarians when they were disaffected to the Government of Vienna. During the late EMPEROR's reign the Pan-slavist societies courted the adhesion of Bohemian Czechs and of Croatian malcontents; and shortly before the Turkish war a Russian general argued in a published work that the Austrian power must be destroyed before the Turkish provinces could be annexed to the Russian Empire. The heir to the Crown was at that time thought to be opposed to German influence both at home and abroad. He has perhaps since been convinced by painful experience that the Pan-slavist agitators have had a large share in producing the excitement which is directed against himself and against Russian institutions. His overtures to Germany and Austria are possibly intended to announce his repudiation of aggressive designs. It was remarked that the EMPEROR was not attended at Dantzig by General IGNATIEFF, who is supposed to be connected with the Pan-slavist party. There is nevertheless no reason to believe that the Minister who, as Ambassador at Constantinople, contrived the long meditated quarrel with Turkey, has forfeited the confidence of his sovereign. The EMPEROR perhaps trusts him rather on account of his general ability than through sympathy with his former opinions. The detection and punishment of Nihilist conspiracies are more urgent and more important than any diplomatic combinations which are at present established or contemplated. The EMPEROR seems to be persuaded that repression must precede, or perhaps supplant, any change in the national

institutions. The latest step which has been taken to counteract disaffection has not been the extension of popular power, but the compilation of a criminal code which in some instances exceeds the previous law in severity. Friendly relations with Germany and Austria may perhaps leave the Russian Government at leisure to repress dangerous conspiracies.

### THE IRISH MIRAGE.

AN observant student of things Irish at the present day might be excused for wondering whether the late Archbishop of DUBLIN, had he been alive, would not have had fair grounds for a treatise of a character not dissimilar to that of his famous "Historic Doubts." There is, indeed, such a place as Ireland marked on the map; there are credible persons ready to testify that they have been there; and the pages of BRADSHAW contain elaborate details of the stages of the journey. A great deal of other circumstantial evidence to the same effect might be collected. Yet the accounts of Irish affairs which come from equally trustworthy sources, and the conduct and opinions to which those accounts seem to give rise, present a hopeless and chaotic discrepancy. For instance, there is confessedly a Coercion Act, or, to speak accurately, there are more than one. The object of these Acts is to restore law and order in Ireland. Therefore it might be presumed that, if law and order were still unrestored, the Coercion Acts would be put in force with vigour. Now it is not denied, though it is sometimes ignored, that Ireland is in a state quite as recalcitrant to the law as it was a twelvemonth ago, though the resistance is less spasmodically violent and more quietly systematic. The Land League has probably discovered that murders of the MOUNTMOOREES kind do not altogether pay, and there are therefore few of them. But minor outrages are not less numerous, and Boycotting is more abundant and more ruthless than ever. All over Ireland the exercise of legal rights is dependent on the co-operation, not merely of police and military, but of a private Vigilance Committee. The agitators have completely dropped the mask, and make no secret of their sympathy with treasonable designs; they advocate armed resistance to the agents of the law, expressly admitting and suggesting the possibility of life being lost in such resistance. Nevertheless no new arrests are made, and the persons already arrested are being slowly and by dribblets let loose once more upon society. Each release is openly taken as a confession of the weakness of Government and as an encouragement to Boycotting, rent-holding, outrage, and so forth; yet the policy adopted with such striking success towards the Boers seems to be in course of repetition towards their Irish admirers. In each case the Government made a show of resistance, and apparently the parallel is to be continued in the Irish case by a surrender. Clearly, therefore, the Archbishop WHATELY of to-day might argue that Mr. GLADSTONE's and Mr. FORSTER's Ireland and the Ireland of ordinary people who take facts as they are must be two entirely different places. The antitheses of the Preacher might be increased by one very useful to statesmen—"There is a time for locking up and a time for letting loose." In the Ireland of fact, the present is most emphatically a time for locking up; in the other Ireland, the strange fantastic region which floats before the eyes of HER MAJESTY'S Government, it is a time for letting loose.

The comments of Government supporters on the Irish affairs of the moment are a study quite as curious as the action of the Government itself. The talk of the Conventions which are now running their course in Ireland is divided with strict impartiality between the department of public treason and the department of private robbery. The latter, as the more practically interesting, has the greater share allotted to it; but the former, as the more picturesque, is not neglected. The treasonable part of the matter has aroused some indignation in England; this, we are told, is "discreditable"; that is to say, not the treason, but the indignation. The schemes for robbery naturally have connexion with the Land Act. The attitude of Mr. PARNELL towards that measure has been perfectly consistent throughout. He has always told his followers that the Land Bill is an idle makeshift, and that payment of rent will have to be done away or reduced to a peppercorn before he puts his coat on. But he is quite willing to make the Bill an instrument of its own stultification. He

is going, therefore, to submit such cases to the Commissioners that they must either falsify the intentions of Parliament as defined by Mr. GLADSTONE and Mr. FORSTER, or else give him an opportunity of starting a fresh agitation on the plea of the futility of the Act. This presents itself to the eyes of the same critics as "eminently reasonable," "a course likely to be advantageous both to tenants and landlords," "a reassuring symptom of returning peace," "the active co-operation of the Land League with the Government." These terms, be it remembered, are applied to a course of action which is not only not intended to have, but which can by no possibility have, any other result but one of two—either the wresting of the Act just passed, so as to transfer to the tenant almost the whole value of the land (for that is the meaning of Mr. PARNELL's doctrine of improvements), or the provision of a new cry for the agitators. The former proceeding could hardly be even to the advantage of the tenants, for an amending Act would have to be at once passed if the Commissioners were intimidated by the Land League into such a construction; but it would be really interesting to hear the process of argument by which any sane man convinces himself that it would be to the advantage of the landlords. It would be still more interesting to know how the sentences we have quoted apply to the second and more probable result, the beginning of a new and more embittered agitation against rent altogether. It is, however, rather idle to examine the mental processes of persons who, being presumably honest, can say that Mr. PARNELL "does not express any doubt of the beneficial character of the provisions as to fixity." If there is one point on which Mr. PARNELL and all his satellites have insisted, it is that the fifteen years' period (that is to say, the substitute for fixity given by the Act) is a dangerous snare, almost certain to prove fatal to farmers. In the face of a direct contradiction of this kind there are, putting out of the question the uncomfortable hypothesis of a deliberate wish to mislead, only two things left. The one is the polite supposition of an Ireland of mirage, on which the critics' eyes are fixed, in which Mr. PARNELL's double says, and the doubles of Mr. PARNELL's followers do, something entirely different from the actual words and acts reported by the telegraph and the post; the other is an impolite supposition as to the intellectual status of the critics concerned which need not be further expounded. It is hardly necessary to go further than Lord DERBY's article in the *Nineteenth Century* in order to see how the real state of the case presents itself to an observer of exceptionally sober temperament and not interested in making capital of it against the Government.

Meanwhile, the actual state of a large, if not the larger, part of Ireland is and remains anarchy, tempered by Mr. GODDARD. It is gratifying, of course, to know that Mr. FORSTER has thought it right to let out the suspects of Kilmallock, because, if his recent letter is construed literally, it follows that Kilmallock must be now a quiet and law-abiding district. As it was but recently one of the most disturbed in Ireland, the change is surprisingly rapid, if encouraging; and the condition of things now that Father SHERIDAN has returned to his flock will be watched with great interest. The holy man is reported to have complained of an outrage committed on him in the form of measurement at the hands of a convict tailor, and to have denounced the diet of Kilmallock as unfit for human food. A candidate for the position of martyr, or at least of confessor, is bound *faire ses preuves*; and, in default of better, the defiling touch of the convict tailor (who had probably indulged himself in appropriating other people's goods, instead of more wisely confining himself to the instigation of his fellows in this course), and the inferiority of the Kilmallock cook to the artist with whose aid the Rev. Mr. SHERIDAN mortifies the flesh in his own humble home, may perhaps do. It is also understood that the thoughtless conduct of the sentries of the Coldstream Guards annoyed Father SHERIDAN. These various distresses will, no doubt, be avenged in a proper manner on the opposite party. There is, indeed, a good deal of difference between the fate of a suspect on one side and on the other. He whom the Government suspects is measured by a convict tailor, is restricted in the number and quality of his courses at dinner, and sometimes, like most officers in HER MAJESTY'S service and their families, is disturbed in a refreshing slumber by the cry of "Who goes there?" or "All's well." He whom the Land League suspects may

think himself lucky if he is not measured for his coffin; if he has money left him to buy bread and cheese, and can find a shopkeeper bold enough to serve him; and if he is not woken by an ear-slitting and carding deputation of Father SHERRY's faithful children. The parallel is agreeably close in kind, scarcely so close in degree. Moreover, it is to be remembered that the latter class of suspects are far more numerous than the former, and that the worst time for them—the long dark nights of winter—is rapidly approaching. They are asking, and no wonder, whether they are to be left defenceless to a repetition of last year's mental and physical torture. Apparently, the Government has no comfort for them; and the supporters of the Government in England protest that everything is going on admirably in Ireland—that the Land Act is "marching" in a manner delightful to behold. It is of course idle for the unfortunate victims to reply that, interesting as the infant attempts of the Land Act at progression may be, their lives and fortunes are of more interest to them personally. The rejoinder, if it were honest, would probably be, "We sincerely hope that your fortunes will be taken from you, and as for your lives, see ye to that." In the Irish mirage all landlords appear to the spectator as "devils," to use the memorable words of Mr. MURRAY. All agitators are active and industrious officials of a legitimate Trade-Union; Boycotting is a matter with which the law has nothing to do; cautions against accepting a fifteen years' tannancy are, as we have seen, declarations of the beneficial character of the provisions of the Land Act as to fixity. The strangest thing, perhaps, is that in the actual Ireland desperation has not yet driven victims to organize a Persons' Defence Association as well as a Property Defence Association. If they have not, it is certainly not the fault of their enemies in England, who have frequently taunted them with their supineness. For this is another odd effect of the mirage before mentioned, that it seems altogether to confuse the spectators' views as to the relation of law and the subjects of law. Unless, however, there is to be a general return to the state of war in Ireland, it may perhaps be as well to suggest, for the hundredth time, that the Government will do well not to wait for another MOUNTMORRES affair before taking action. They have, after long delay, organized something like a system of helping those who help themselves in the matter of property; perhaps after another winter of crime and suffering something may be done for the protection of life and limb.

#### THE FRENCH MINISTRY.

THE Ministry of M. JULES FERRY is perhaps the first to which victory and resignation have all along been exchangeable terms. It seems to be universally understood that, as soon as the new Chamber has met, the PRIME MINISTER will place his own office and those of his colleagues at the disposal of the PRESIDENT. Yet M. FERRY points with truth to the fact that the new Chamber of Deputies is in an unusual degree the double of its predecessor, and infers, as he has certainly a technical right to do, that an election which has sent back an unusual proportion of the old members must be taken to express unabated confidence in the Government which those members supported. These two incidents—the return of a Ministerial majority and the resignation of Ministers—would be incompatible in any country but France. In France, however, they co-exist without difficulty. They both spring from the abnormal position which M. GAMBETTA has so long chosen to maintain. As he was the real leader of the majority in the former Chamber, and as it is his majority that the elections have further strengthened, it is only fitting that at the beginning of a new Parliament the Minister who has been keeping the place warm for him should ascertain his patron's pleasure as to his further retention of office. This time it seems to be regarded as certain that M. GAMBETTA will not refuse to become in name what he has long been in fact. It is now announced, with what seems to be sufficient formality, that M. GAMBETTA will not again be a candidate for the post of President of the Chamber. This determination has not been arrived at in quite the most dignified way. Only a few days ago an opportunist journal advised the deputies to re-elect M. GAMBETTA, as the most unequivocal intimation to M. GRÉVY of their desire that he should make M. GAMBETTA Prime Minister. If this recom-

mendation was given with M. GAMBETTA's knowledge, he has quickly seen reason to change his tactics. Instead of counselling the Chamber to re-elect him, his friends are now busily proclaiming that he will not consent to be re-elected. It is whispered that the cause of this change is the discovery that, even if he did consent, he would probably not be re-elected. His enemies, whether of the Right or of the Left, naturally see in this fact evidence of his waning popularity. It is at least equally open to another explanation. If M. GAMBETTA wished again to be President of the Chamber, he would be opposed, not merely by the Right and the Extreme Left, but by a large number of the deputies who wish to see him at the head of the Government. They may not as yet feel assured that M. GAMBETTA is willing to take office; and, as they have no doubt as to their own desire that he should take it, they may not wish to place him once more in the position which for the last four years has enabled him to keep behind the political scenes.

It is certainly time that M. GAMBETTA should take the conduct of affairs into his own hands. The explanation given at the time of the speed with which the elections were hurried on has been completely borne out by events. From every point of view except one it was inconvenient to nominate in August a body which could not come into legal existence till October. Any reason that could have been sufficient for anticipating the elections would also have been sufficient for dissolving the old Chamber and leaving the place vacant for its successor. But the Government were not at all anxious to hurry on the meeting of the new Chambers. All that they wanted to hasten was the election of the deputies. The meeting of the Chambers meant criticism of their policy in North Africa, and their desire was to get the elections over before it had become necessary to put forward any such policy. The happy interposition of the great Mussulman fast gave them just the opportunity they wanted. While that lasted they reckoned that there would be no actual war in North Africa, and consequently nothing to convict Ministers of falsehood if they chose to protest that there was no war impending. General FARRE will now have to clear himself from the charge—if, when he is once out of office, any one thinks it worth while to bring it forward—of having subordinated the military interests of France to the success of a political manoeuvre. He cannot have been ignorant of the heavy demand which the war in North Africa would make on the military resources of France; but he chose to postpone his preparations to meet it until the Government could no longer be endangered by the dislike of the peasant voters to war expenses. The Minister of War, when, as in France, he is a soldier, stands in a position distinct from that of his colleagues. The country looks to him to protect the efficiency of the army even against the Cabinet. Under a Parliamentary system a Government will often be tempted to sacrifice the military interests of the country to its own immediate popularity. Ministers wish to represent their policy as pacific when it is really warlike, and they postpone putting the army on a war footing till the latest possible moment; or they do not choose to admit that a war they have embarked on is as serious and as costly as they know it to be, and they make their military preparations square with their words, and not with their convictions. What is the object of having a soldier in the Cabinet except to prevent this kind of thing from being done? A civilian War Minister is naturally inclined to go with his civilian colleagues; a professional War Minister is presumed to care more for the army than for politics. Consequently, with a professional War Minister in office, the country is disposed to rest satisfied that no great mischief can be going on. If the army were not properly looked after, General FARRE would not remain at his post.

If M. FERRY had been more popular, General FARRE might not have cared to give him the chance of making a scapegoat of his War Minister. But when the fall of the entire Ministry is evidently impending, it matters little on whose shoulders the blame first falls. General FARRE's special punishment will probably come in the shape of exclusion from office under the new Prime Minister. He is supposed to be a favourite with M. GAMBETTA, and to have been marked out by him as one of the Ministers who would be permitted to survive M. FERRY's resignation. That chance is now gone. M. GAMBETTA will hardly venture—unless some conspicuous success in North Africa converts General FARRE's errors into virtues—to reappoint

a Minister who has been the object of such fierce and apparently such well-founded attacks upon all sides. General FARRER's case is not improved by the cleverness of his colleagues in exempting themselves for two months from the possibility of Parliamentary control. If it had been possible to call the Chambers together, M. FERRY could hardly have spent money so freely on a war which he had always represented as a mere series of skirmishes, without coming to Parliament for permission. But, though there are two Parliaments in existence, neither of them can be got at. The new Chamber does not enter into possession of its powers until the powers of the former Chamber have expired by effluxion of time. Yet it would be absurd to ask the old Chamber to vote away public money when it has been discredited by the election of its successor, and when it has only another month to live. It unfortunately happens—so the Government will put the case—that in this interval a sudden need for spending money on the army has arisen, without its being possible to obtain it in the regular way. Fortunately the money voted for military purposes last Session is not yet exhausted, so that the MINISTER OF WAR has not been compelled to anticipate the consent of Parliament to the necessary outlay. Neither of these pleas seems likely to find much favour with the new Chamber. As regards the first, the rejoinder is obvious. The Cabinet was under no obligation to hurry on the elections, and the only legitimate reason it could have had for so doing was a desire to submit its African policy to the judgment of the country through its freshly elected representatives. But if this had been its motive, it should have advised the PRESIDENT to obtain the consent of the Senate to an immediate dissolution, in which case the new Chamber would naturally have met as soon as the elections had been held. As regards the second plea, the Budget is voted by chapters, not as a whole, and it is as illegal to use money voted for one military purpose in the accomplishment of another as it would be to appropriate to military purposes money voted for civil purposes. If M. FERRY wishes to avoid having to leave office for no apparent reason, he is taking the best possible means to obtain his end. It is probable that by the time the Chambers meet, the missing reason will have been abundantly provided.

Why M. FERRY should have thus laboured to retain power which he must have known that he would have to abandon so soon, it is hard to say. To be M. GAMBETTA's *locum tenens* is not a very exalted ambition, even when no term is set to the holding of the office. But when it is plain to all men that a very precise and near term is set to it, and that by the end of October at latest M. FERRY will have to make way for the real leader of the majority, the prize becomes so small that it seems scarcely worth purchasing at the cost of a reputation for sharp practice, and the certain discredit which this reputation brings to a Minister. The only conceivable explanation is that M. FERRY really thought that, by holding the elections in August, he could secure a majority devoted to himself and ready to sustain him against M. GAMBETTA. In that case he must be regarded as the victim of one of the strangest delusions ever evolved out of human self-conceit.

#### ELEMENTARY EDUCATION IN 1882.

THE Session came to an end without any further explanation being given of that apparently insoluble problem—the proposed Education Code for 1882. Probably the knowledge what it means is still confined to the permanent staff. Sir FRANCIS SANDFORD and Mr. CUMIN have not yet taken their Parliamentary chiefs into their confidence. Perhaps they regard the Code in the light of a conundrum, which Lord SPENCER and Mr. MUNDELLA must consent to “give up” before the answer can be told them. The “series of simple propositions” relating to the Code which appeared in the *Times* of Monday may possibly have been supplied from the Education Department. Who, indeed, among outsiders would be bold enough to have an opinion on what this or that provision is intended to effect? If so, the department is, or pretends to be, as ignorant as everybody else. There is much useful matter contained in the simple propositions; but it does not touch the parts which most need to be made intelligible. In particular, the really admirable puzzle how the Government grant can depend at once upon the

average attendance of the children and the results of the examination remains as mysterious as before. So, too, we imagine does the question, even more interesting to school managers, whether, on the whole, they will get more or less under the new Code than they got under the old one. The ninth and tenth propositions will certainly command the full assent of every one connected with an elementary school. “Many essential things are left uncertain and undetermined.” “All essential data should be published without delay.” The list of unsettled points is long enough to supply material for a separate code, and it includes such questions as what proportion of the children in the first two standards will be examined by sample, and how the choice is to be made; and what is to be the rate of payment per head in respect of the standard examination. In the ordinary course of things the Code will be laid on the table at the beginning of the Session, and will become law in two months after that time. “It follows, therefore, that large numbers of ‘schools’—those, that is, whose school years end on the 30th of April—are at this very moment almost half way through ‘the year, at the end of which it is at present absolutely uncertain whether the grant they will earn will reach ‘within 20 or even 30 per cent. of the sum they reckoned ‘upon receiving when they settled their staff and scale of ‘salaries for the current year.’ If the grant falls short by this amount of what previous experience had taught them to expect, the deficiency will have to be made good—in voluntary schools by additional subscriptions, in School Board schools by an additional rate. The coming spring promises to be a lively time alike for School Boards and School Committees.

The change which looks biggest and which will really effect least is the direction given to Inspectors to examine children presented under the first and second standards in “sample” instead of in “bulk.” Instead of listening to each child's reading and looking at each child's writing and arithmetic, the Inspector will take every tenth or every seventh child, and judge of the proficiency of the class from the proficiency of the children thus picked out. If this plan is worth anything, it is worth applying on a more extensive scale. Under most circumstances the children presented in these two standards form but a small proportion of the whole school, and even this proportion is abridged if either of these standards is the standard fixed for partial exemption from school attendance. In that case the Inspector must examine every child as he does now. Unless the Inspector takes the trouble constantly to change his method of selection, the way he arrives at his sample will soon become known to the teachers. If he habitually calls out every third or every seventh child in the row he sees standing before him, the teacher will take care that every third or every seventh child is fit to be called out. The sample will really be forced upon the Inspector, though he thinks it is picked out by him. Supposing that he is at the pains to choose the children at random, he will find it difficult always to resist the representations of the teacher that to take this particular child will bear very badly on the school. Illness, it will be represented, has made one boy unavoidably irregular in his attendance; another has just lost his mother, and though he has come to the inspection to please the teacher, he was obviously not fit to go through an examination. The chances are that the Inspector will take refuge from all requests to make changes in his sample in a hard-and-fast rule. In that case his rule will very soon be discovered, and though he will no longer be asked to alter the composition of his sample it will only be because it has been carefully composed for him. The time that the Inspector saves by examining only a few of the children is to be spent in inspection as distinct from examination. He is to take note of the organization and discipline of the school and of the methods of instruction employed in it. School Inspectors are perfectly free to do this at present; and, if they make proper use of their assistants, they will usually have time to do it. It is not done, however, to any great extent; and the reason probably is that it makes greater demands on the Inspector than he cares, or perhaps is always competent, to meet. Circumstances have given a kind of distinction to School Inspectors as a body, a distinction which is sometimes supposed to imply more than it really does. The Inspectors are usually men who have taken high honours at the Universities; indeed, it has sometimes been pro-

fanely said that the whole system of Parliamentary grants exists to enable successive Lord Presidents to find places for their young friends at Oxford and Cambridge. But high honours, though they are excellent things in themselves, do not necessarily give their possessor the faculty of divination as regards the organization, discipline, and methods of elementary schools. From this point of view, to be a good Inspector requires either a special natural faculty or careful training. The natural faculty is given to some Inspectors and not to others. The training is given to none. If they get it they get it from their observation and common sense. From the moment of his appointment an Inspector is left practically alone. He invents his own methods, writes his own reports, and generally goes his own way. It is quite possible, therefore, that the opinion of an Inspector on the organization and discipline of a school and the methods of instruction employed in it may be worth just nothing at all. He may have infinitely less knowledge of these things than the master whose work he is criticizing, and he has no means of getting at that accumulated tradition about them which may be supposed to exist in the Inspectors taken as a body. Consequently the fact that, under the sample system, he will have more time to give to a duty which he may quite possibly be not fit to discharge, is not by itself any reason for thinking well of the change.

Apparently the Education Department is pretty much of this mind, for, by another of the improvements which Mr. MUNDELLA proposes to effect, the Inspectors are to be reorganized as a hierarchy. The country is to be mapped out into large districts, over each of which is to be placed a Chief Inspector, who is to overlook and be in a measure responsible for the work of all the other Inspectors. This will be an immense improvement upon the existing arrangement if proper care is taken to make the right men Chief Inspectors. If they are to be of any use they must have both the requisite knowledge and the tact which is needed to apply it. It is no light matter to be suddenly put over the head of men some of whom will probably be older both in age and official standing than the Chief Inspector, and to be charged to see that they do their work properly. The subordinates will often think themselves quite as good as their new superior, and they will consequently be much disinclined to accept his hints or obey his directions. If the Chief Inspector is really no better than they are, or if, being better, he thrusts his superiority upon them with no discrimination of the men with whom he is dealing, the hierarchical experiment will break down, and the department will be obliged for the sake of peace to go back to the old plan of making every Inspector a law to himself. It will be very much to be regretted if this should happen, because the idea which underlies Mr. MUNDELLA'S proposal would, if properly carried out, remove a serious blot on the system of school inspection. Everything turns upon the question whether the department will have the courage to promote the most competent Inspectors without regard either to their seniority or to their standing outside the office. The permanent chiefs have had abundant opportunity of seeing how the work of inspection is done, and they are probably quite able to lay their finger on the men by whom it has been done best and who are most competent to take care that other men do it well. The doubt is whether they will be bold enough to recommend these men, and these men only, to the Lord President, and whether the Lord President will be bold enough to act upon their recommendation.

#### WIMBORNE MINSTER.

WE are sorry to learn that another of our great historic churches is in trouble. The central tower of Wimborne Minster has recently given signs of failure, and prompt and decided measures will have to be taken to arrest the mischief. Wimborne, though not one of our grandest minsters, and much inferior in size to the neighbouring churches of Sherborne, Romsey, or Christchurch, scarcely yields to any of them in architectural and historic interest. Its remarkable outline, presenting a low massive central lantern, and a tall western tower, reproducing on a miniature scale the outline of Ely, and that of Hereford till a hundred years back, cannot fail to attract attention. These two towers indicate the double destination of the church. The central tower, of Transitional date, was that of the collegiate church; the western, of a thoroughly parochial type, was added by the parishioners in the middle of the fifteenth century, as at Blyth, and Christ-

church, and elsewhere, to hold the peal of bells. It is the earlier of these towers, that standing in the centre of the fabric, that is in danger. Serious cracks, we are told, have shown themselves in the north-eastern pier of the crossing. The other three piers also afford ominous indications of internal movement; and, as the fractures are slowly but surely increasing, it is no longer a matter of doubt that the tower is, in builder's language, "alive," and that nothing but a process of underpinning and strengthening the supports of the lantern will save this chief ornament of the fabric from eventual, perhaps speedy, ruin. The foundations of the tower appear to be sound, which is not always the case in Norman buildings, and give no indications of settlement or weakness. The source of the mischief lies in the piers themselves. These, like the works of Norman builders generally, with all their seeming solidity, are so inartificially constructed that the wonder is, not that they should be failing now, but that they should have stood so long. Their huge bulk and apparent strength are simply deceptive. Norman pillars are really nothing more than outside cases of ashlar, or cut stone, enclosing a core of rubble brought into something like cohesion by a vast quantity of mortar, but with no real bond, either in its own incoherent mass or with the external shell. For a time, longer or shorter (and certainly some of these Norman structures may boast of a tolerably extended existence), these vast bulks stand by the sheer force of dogged resistance. But they carry the elements of their own ruin within them. In the lapse of centuries the cohesion of the core, small at first, weakens; the rubble becomes more and more friable, and is kept in its place merely by the strength of the outside case, from which, when an aperture has been made, it has been known, as in the central tower of Hereford, to gush out in a continuous stream of powder for several seconds. As long as the shell is able to resist the outward strain the structure will stand. But when once, as at Wimborne, the skin begins to burst, its fate is sealed. The ruin may be more or less gradual, but it is inevitable.

There is hardly one of the grand old Norman towers which impart such stateliness to our cathedrals and abbey churches which has not proved a *damnum hereditas* to after generations. Indeed almost from the time they were first built they have been tumbling about people's ears. Bishop Walkelyn of Winchester was hardly cold in his grave when, in 1107, the massive tower of the cathedral he had built fell to the ground—in indignant remonstrance, so men said, at the unhallowed corpse of the Red King having been buried beneath it. Towards the end of the same century towers fell at the cathedrals of Gloucester and Worcester. The central tower of Lincoln came crashing down in 1240, while one of the canons was preaching in the nave, "the very stones crying out," as he asserted, against the alleged oppression of Bishop Grostete, in claiming to perform an official visitation of his cathedral church. Abbot Simeon's central tower at Ely, though outlasting that of his brother Walkelyn at Winchester by two centuries, came down in 1321, after long threatening, "with a horrible ruin and collision of stones, which shook the whole city like an earthquake." A fortunate loss we may consider it, as it gave scope for the erection of what Mr. Fergusson has justly termed "perhaps the most beautiful and original design in the whole range of Gothic architecture," Alan of Walsingham's unrivalled octagon. The faulty principles of construction of the mediæval builders are shown by a multitude of similar catastrophes at Evesham, Dunstable, and elsewhere, as well as by the instances where the threatened ruin has been averted, either, as at Peterborough (somewhat on the principle of the Irishman who killed his pig to save its life), by pulling down the falling tower, or, which was more commonly the case, as at Wells, Salisbury, and Canterbury, by internal buttresses and strainer-arches, and other engineering devices, commonly more successful than beautiful. But, passing these by and coming to modern times, the Norman central tower of the grand abbey church of Selby, which forms so conspicuous an object to travellers on the Great Northern line, fell in 1690, crushing the south transept, which was never rebuilt. The tower itself was replaced by an ugly structure in the bald Palladian style of the day, which we hope will not be allowed to disfigure the beautiful church much longer. The western tower of Hereford Cathedral, standing, like the bell tower at Wimborne, in the centre of the west end, was allowed to crumble to pieces in 1786 before the very eyes of its guardians, who, probably congratulating themselves on being well rid of a source of constant trouble and expense, made no attempt to rebuild it; and, to close the list, in our own day, on the 21st of February, 1861, the central tower and spire of Chichester Cathedral fell, in spite of the most strenuous and well-considered efforts to avert the ruin; to quote the late Professor Willis's graphic description, "the spire descending perpendicularly into the church as one telescope tube slides into another, the mass of the tower crumbling beneath it." A similar downfall was averted in the cathedrals of Hereford, St. David's, and St. Albans by the engineering skill of Mr. Cottingham and Sir Gilbert Scott, and still more recently in the south-western tower of Lincoln Cathedral—where the enormous weight of the fourteenth-century belfry was crushing Bishop Alexander's Transitional work below, and even the apparently solid substructure of Remigius—by that of Sir Gilbert's distinguished successor as the Cathedral architect of the day, Mr. J. L. Pearson. In the last-named cases the work of underpinning and rendering the crushed substructure once more equal to the support of the enormous weight above it, which during the

operation had to be borne up in mid-air by huge balks of timber, was one of gigantic difficulty as well as of the extremest delicacy.

At Wimborne, from the smaller dimensions of the fabric, and the less formidable weight of the tower, the difficulties will be less alarming and the work less costly. It is, however, a task which imperatively calls for the best architectural skill, and for that courage united with discretion which nothing but large experience can supply. We earnestly hope that local or diocesan claims will not be allowed any undue weight, but that those with whom the responsibility of the restoration rests will not scruple to take counsel with the first architectural engineers of the day, and will place the actual work in the hands of one who has elsewhere proved his ability to cope with the difficulties and dangers inseparable from such an undertaking. The seat of the evil lying within, in the originally faulty construction and the subsequent disintegration and decay of the masonry, no measure can prove really effectual but the taking down of the defective pier or piers, and their rebuilding with the utmost solidity. All patching or piecing is to be deprecated. It would merely hide the mischief temporarily, deferring, but in no sense arresting, the downfall. Such a course was at first adopted at Chichester. New stone work was built up round the rotten core and bonded with its mass, and with what result we know only too well. The old fissures spread into the new masonry, and new ones soon began to open. The outside casing exhibited only too plainly the hopeless state of disintegration of the mass behind, and before many months were over the tower and spire collapsed, and the whole work had to be begun where it ought to have originally commenced—from the foundation. The only true policy in such cases is Stradford's "thorough."

We must at the same time express our hope that the restoration of the tower will not extend beyond the necessary reconstruction of the failing piers, and the resetting of any portions of the external work which are actually dangerous. The pyramidal pinnacles and heavy battlements added after the fall, in 1660, of the spire which once crowned it, for the removal of which some are clamouring, though coarse in detail and out of harmony with the beautiful Transitional arcades beneath them, are by no means bad in effect, and are of great value as marking an epoch in that history of the fabric which is so distinctly written, century after century, on its walls, and which would be falsified by their destruction. The re-erection of the spire, however much we may regret its loss, would certainly be unwise. Strengthen the piers as much as you please, still, unless the whole of the tower were rebuilt (and that, we fancy, the Wimbornians are not quite prepared for), the additional weight could hardly fail to prove a great element of mischief to the already crazy structure.

Wimborne Minster suffered such irreparable injury at the hands of restorers twenty-five years back that the very thought of a second restoration is alarming. We are far from denying that some very desirable changes were then effected, in the removal of the pews and galleries with which the interior was encumbered, the opening of the beautiful central lantern and of the western tower arch, while the removal of the plaster disclosed a most interesting feature in the original Norman clerestory of the nave. But these gains were sorely outweighed by other unwarrantable changes. Old features were done away with, and new ones introduced, to the confusion of the archaeologist; mouldings were recut, and the stonework retooled; the exterior of the choir was cased in smooth new ashlar, imparting a painfully modern air to the venerable building; while, by that complete misconception of the true purpose and meaning of a collegiate church which has operated so fatally elsewhere, which treats what is really two churches as one to be used at one and the same time from end to end, the choir was, as far as was practicable, thrown into the nave, and the essential distinction between the church of the college and the church of the parishioners was obliterated. Happily it was impracticable to destroy the grand ascents by which the eastern limb is elevated, and the sacristy, which stands upon a vaulted crypt, raised again to a still greater height. But the incomparably rich cinque-cento choir fittings, with their stalls and gorgeous over-arching canopies and elaborate screens, dating from the fall of the spire, which exhibited the most perfect example of a Jacobean choir in England, the organ occupying its true position over the western entrance above the returned stalls, were ruthlessly sacrificed to the vain hope of making the whole area available for congregational purposes. As it stood a quarter of a century ago, the choir of Wimborne Minster was one of the most charming things that could anywhere be seen; beautiful as a work of art, and invaluable as an example of ritual arrangement. But, in spite of the late Mr. Petri's earnest pleading in their behalf, the stalls were lowered, the canopies demolished, the organ dethroned, the choir gates removed, and the whole so completely reconstructed as to lose nearly the whole of its architectural interest and the whole of its ritual value, and to afford one of the many proofs that restoration and destruction are too often convertible terms. No such barbarism is, we hope, possible now—though such examples as the west front of St. Albans and Lincoln's Inn Chapel are not reassuring—but we shall watch the works at Wimborne with painful interest. Hints that have been let fall as to the restoration of the transepts make us apprehensive lest their venerable masonry should be destined to disappear under a casing of modern ashlar, as that of the choir has done, and the exterior lose the small remains of antiquity it still exhibits. No single stone should be tampered with, unless its state of decay is such as to endanger the stability of the

building. A smooth modern wall may be very pleasing to the eyes of a nineteenth-century restorer, but to a lover of the past it is utterly uninteresting.

This danger, however, is not unlikely to be averted for the present by the want of funds to carry out the restoration. Wimborne, rich as it is in historical memories as one of the chief towns of Wessex, from the days of St. Aldhelm and King Ine down to those of Alfred's elder brother Ethelred, who lies buried in the minster, and Edward the Elder, is but a small county town of no great wealth; while the county of Dorset has suffered more severely than most from agricultural depression—its population having fallen from 195,544 in 1871 to 193,979 in 1881—and is hardly in a position to contribute very largely to the restoration of its venerable historic minster. Three hundred and forty years ago, when the central tower, then weighed down by its tall stone spire, had "foundered and was lyke to fall," and there was "no money left yn the church boxe," the silver reliquary which had in more religious days enshrined the head of their sainted foundress, Cuthburh, King Ine's sister, presented itself to the minds of the parishioners as a hopeful means of raising the necessary funds. In a still extant letter to Thomas Cromwell, then omnipotent with his royal master, dated 1538 (the year of the demolition of shrines and the confiscation of reliquaries to the King's use), the guardians of the church state that "need constrainth" them "to sell the sylver y<sup>e</sup> ys about the seyed hed of Seynt Cuthborow," which they conceive belongs to the parishioners, "as y<sup>e</sup> was made by their charity," and they beg the then universal referee to certify them "y<sup>e</sup> they may sell the sylver and not offend their prince." Whether the reliquary was used as the parishioners desired or went to the King's melting-pot we are not informed. But as not very many years afterwards the dreaded catastrophe took place in the fall of the spire, we may perhaps conclude that the latter was the case. Happily Canford Manor is not far off; and we may hope that the iron of the mines of Howlais may prove a more effectual means of reinstating the foundering tower than the silver of St. Cuthburh's head.

#### REPUBLICAN BAPTISM.

IT is rather unkind of the *Standard's* Paris Correspondent to describe M. Victor Henri de Rochefort-Luçay as "a grey-headed old man." Grey-headed he certainly may be, but old he as certainly is not. In the country of *actes de naissance* it is not very easy to play tricks with the date of your birth, and there is no reason to doubt the statement usually made that M. Rochefort is a man of mille-huit-cent-trente in the sense of having been born in that famous year. However, M. Rochefort has gone through a sufficient number of experiences to age him. To have been not once, but twice or thrice, the most popular man in Paris, if not in France; to have thrown away more opportunities than most men in their wildest dreams hope to possess; to have been transported to the other side of the world and to have run away therefrom, not to mention a dozen or so of duels, are experiences quite enough to turn a man grey. It does not, however, appear that years have brought the philosophic mind to M. Rochefort. He is just as shrewd as ever on his few sane points, and the bee buzzes just as loudly in the vacant spaces of his bonnet. If, for instance, it is true that the French Government is going to prosecute him for his very wholesome and timely comments on the Tunis expedition, then he has done another excellent stroke of business, and will have another opportunity, which, beyond all doubt, he will throw after the rest. But on Saturday night in last week the bee was buzzing very loudly indeed. It is one of the most interesting points in the history of Freethought that Freethinkers are nearly always unhappy without some substitute for the forms and ceremonies which they pride themselves on having rejected. They thrust the "mummery" out of the Christian door; but, somehow or other, it comes back again through the Secularist window. The remarkable work which was the occasion of the first expression of community of soul between Mr. Gladstone and Mr. Bradlaugh contains many instances of this, the most singular of which is perhaps the Freethought form of dismissal, in which the faithful are requested to "keep the social system in view," as if it were likely to play them a kind of confidence trick. Readers of the late Mr. J. S. Mill have not forgotten his comments—in which, for once in a way, he showed that he had no small sense of humour, or might have had under other circumstances—on the remarkable Comtian substitute for the sign of the cross. This, if we remember rightly (for we quote from memory), consists in successively touching the organs, according to phrenology, of the more important passions and faculties of the mind; and Mill suggests, with much gravity, that if any one will try the process before a looking-glass he will see reasons for doubting its impressiveness. We are not certain whether the Parisian "Freethoughtists" have adopted this sign; but it is not likely, for Comte is now generally regarded by them as a terrible reactionary. They have, however, perhaps on the advice of Mr. Bradlaugh, devised a ceremony of civil marriage to supplement the august performance of the *mairie* and his *écharpe*, though a sincere Republican might be excused for thinking this an insult to the Republic. In the case of baptism, the need of a comforting substitute is even more evident, for here there is no mayor and no scarf to fill up the place of the detested priest and his trappings. Accordingly, M. Rochefort's

brains, which are active if also volatile, have been called upon to meet the occasion. We do not think that this is the first instance of the celebration of the rite, but it was attended by some pleasing utterances of the Pontiff, and therefore deserves the prominence which has been given to it.

M. Rochefort must be complimented upon an improvement on the original Republican baptism of Carrier. That ceremony consisted, not in tying the victims together as in the case of the Republican marriage, but in pitching them simply and singly, or sometimes in boatfuls, into the Loire. But circumstances alter cases, and the Republic of to-day is for the moment in a milder mood. Instead of an uncomfortable river bank, with devotees of equality and fraternity waiting to poke back the victims into the stream if by any chance they should be washed ashore, the scene of the rite was a comfortable inn at St. Denis, known as the "*Lapin qui Fume*"—doubtless from its expertness in providing the beloved *gibelotte*, as to the composition of which sceptical Parisians have theories. This Rabelaisian atmosphere may perhaps be in part responsible for the singular statements which, as we shall see, the Pontiff or Patriarch, or whatever he is to be called, proceeded to make. Everybody dined, and then M. Rochefort gave them an account of his voyage round the world; the result of which apparently has been that M. Rochefort's heart, untravelling, fondly turns to home. The French alone, said he, were really independent and liberal, which, considering that the French sent the speaker to New Caledonia, must be said to be a proof of magnanimity and forgiveness of injuries which, if we were not afraid of insulting M. Rochefort, might almost be called Christian. The French alone, continued the orator, knew how to get rid of despots. Here there seems to be a slight suspicion of national vanity, for the process, though the expertness of the French nation in it cannot be contested, was not original in their case, and has been freely imitated. To prove his case, however, M. Rochefort suggested that his audience should go to England. There they would find that the working-men could not shake off the trammels of religion, and that they were all convinced that Lords were made of a different clay from themselves. It is not exactly clear whether these two statements are to be regarded as connected in the ratio of cause and effect, or whether they are independent proofs of the inferiority of Englishmen. If the former be the case, M. Rochefort is to be congratulated on having added to the famous saying, "No bishop, no king," "No religion, no House of Lords," and on having indicated to the enemies of the Upper House in England where they must begin. But M. Rochefort had more to say about the House of Lords. "If his hearers could only see it! All the members got as drunk as porters and staggered about the lobbies." Now this is really interesting. M. Rochefort has been in England, though, if we mistake not, for no very long period. His intelligence as to the House of Lords may therefore be first hand, or it may be derived from his friend Mr. Parnell and the other Irishmen who visited him not long ago in Paris; or, to adopt a third and perhaps the most probable hypothesis, it may be an instance of the national habit of valiant and unhesitating deduction. M. Rochefort has doubtless studied the English language, and has come across the phrase "as drunk as a Lord." By careful examination of the context he has discovered that this is used to imply an unusual and specially glorious state of drunkenness. Obviously, then, the practical English would not compare very drunken persons to Lords if Lords were not very drunken persons. We can supply M. Rochefort with several arguments of a similar kind and of still greater weight. It is known, for instance, that the House of Lords has a strong objection to sitting after the dinner-hour if it can help it. Clearly the reason of this is that its members know themselves to be in a state of utter unfitness for their duties. To stagger about the lobbies is one thing; but to stagger round the Woolsack in the vain endeavour to climb upon it is another and a very different thing. Any Lord of sense would know that his brother Lord, the Lord Mayor (who is obliged to keep sober for this very purpose during his term of office), would come and take him in custody, and put him in the Tower, if he behaved himself in this way. So he and his fellows wisely adjourn about eight o'clock, and stagger about the lobbies to their hearts' content. It is very odd that when, not long ago, a discussion took place about the possibility of lengthening the hours of the Peers' sittings, this simple explanation of the difficulty did not suggest itself. But they manage these things much better in France.

After a little abuse of M. Gambetta, the toast of the evening, or at least its equivalent, seems to have made its appearance. The formula appears to be this, "*Citoyens and citoyennes*" (we hope it was the other way, but we follow our text), "we are about to proceed to the initiation of three young children to whom Freethought opens its ranks. It is requisite that we should emancipate ourselves from antiquated superstition before we can think of extirpating tyranny." Then M. Rochefort proceeded to open the ranks of Freethought to three small children, and to emancipate them from antiquated superstition. The actual ceremony seems to have been simple in the highest degree. The Pontiff attached pieces of red ribbon round the neck of each child, for all the world as if they had been black kittens or white fluffy puppies. *C'était tout.*

Somebody once suggested that, instead of *Red Cotton Nightcap Country*, it would have been much more appropriate if Mr. Browning had called France *Red Silk Ribbon Country*. No Frenchman in the past has been for something like a century happy unless he had some of this substance at his buttonhole; and it is clear that no right-minded and Freethinking Frenchman in the

future will be happy unless he has some more round his neck. The outward and visible sign cannot be said to be expensive or painful or troublesome to procure. But, on the other hand, it is open to the objection that it will get very shabby, especially if the infants are subjected to proper ablutions, and that it will be uncommonly tight by the time they reach man's and woman's estate. Perhaps a solemn ceremony of letting out the ribbon might be devised as a kind of Republican confirmation, in lieu of that first communion which a patriotic *maire* somewhere in France has just rewarded some young persons for neglecting. As has been hinted already, there seems to be a savour of antiquated superstition about the rite. Freethought should surely be more independent of forms and ceremonies. But M. Rochefort doubtless knows his people best. The worst of it is that there seems to be no central authority for introducing uniformity in the matter, which is very desirable. Perhaps M. Paul Bert, when he takes office, will look to this. But M. Paul Bert is so identified not, indeed, with Christianity, but with Antichrist, as M. Rochefort understands that personage—that is to say, with M. Gambetta—that he would probably be suspect to the subscribers of the *Intransigeant*. M. Rochefort had better, therefore, devise a new book of rites and uses himself; and if he has any time to spare, it would be exceedingly interesting to have a volume of English Notes as well from his hand. It is a long time since we have really seen ourselves as we are, and M. Rochefort's intimate acquaintance with the manners of the House of Lords marks him out as the man to succeed MM. Esquiros and Taine. "A Night with the House of Lords" would be an invaluable chapter for the purposes of the English enemies of that institution. As for the address at St. Denis, the only thing to be feared is that M. Rochefort should have raised feelings rather of envy than of abhorrence among the customers of the "*Lapin qui Fume*." There was a time when most Frenchmen were sober; but that time, at least in the great towns, is over, and scandal will have it that the purest Republican politics are usually found in conjunction with the most ardent devotion to the practice familiarly known by the phrase *tuer le ver*. Let us hope that there is as much truth in this imputation as in M. Rochefort's description of the nightly habits of Lord Shaftesbury and the bishops. Perhaps, however, there is a set of Republican commandments as well as a Republican liturgy, and one of them is "Thou shalt bear false witness against all aristocrats."

#### NEWGATE.

THE precise reasons which induce the City authorities to demolish Newgate have not yet been made public. To the outsider it would sometimes appear as if every municipality and corporation, religious or lay, was subject to periodical fits of destructiveness. As a prison, Newgate, no doubt, is antiquated; but we shall probably see the present building succeeded by a smaller one for the safe custody of prisoners during the sessions, and may ask without impertinence why the old prison could not have been a little altered and made suitable without absolute destruction. Many of the arguments against the removal of Temple Bar apply with greater force here. We were told, for instance, by innumerable writers that Temple Bar was the last of the City gates. They forgot, or never knew, that it never had been a City gate; but Newgate is unquestionably one wing of a real City gate, having been built on the site of the southern portion of the ancient arched entrance to the City from Holborn. As to associations, also, Newgate is far more interesting than Temple Bar. It vies, in fact, with the Tower in the eminence of its involuntary inhabitants. Though it would be a mockery to say of the present edifice that it is ornamental, it is undoubtedly one of the most satisfactory public buildings in London—gloomy, strong, impressive, and with its object as plainly marked on it as if the word "prison" was stamped on every stone. Dance, its architect, deserves the credit of having designed a perfectly simple, but perfectly suitable, façade, the more so as, though it is three hundred feet long, it has no windows, except in the central portion, only thirty feet in width. Although the height is only fifty feet, the effect produced by the mere mass and outline is comparable to that of a Norman keep. The central lodge, with its numerous arched windows in five stories, has been severely criticized; but, without some such feature, the plainness of the rest of the front might have failed of its due effect. The earlier design consisted of only three stories with an entablature, but the present arrangement is very preferable. The statues removed from the old Gate, and now set up in two niches on the front and two at the south side, are somewhat incongruous, and the festoons of fetters form a very lugubrious kind of ornament. The hundred years of its existence have seen many alterations and improvements of the interior, but have left the exterior substantially as it was when the new building was completed in 1782.

The name of Newgate may be compared with that of Newport at Lincoln. Both belong to the entrances of Roman cities. It may be too much to say that Newgate is the oldest of the London City gates, but it would be difficult to prove the greater antiquity of its rival, Bishopsgate. As a Roman gate it has the advantage, for the northern entrance to Roman London was some distance to the east of the site of the mediæval Bishopsgate, while Newgate is very near the place where the Watling Street reached the City wall. When the Romans had diverted the old road at what is

now the Marble Arch, so that it no longer pursued the course of the modern Park Lane to the ford at Westminster, but turned towards what was then the newly-constructed bridge at London, the place of the gate on the hill was determined by the place in the valley below of the bridge over the Fleet. The Hole-bourn in later times took an English name from its course among the high clay banks of Coldbath Fields; here it became a tidal estuary wide enough for ships probably as large as any then built. A water-gate may have existed at Ludgate, though there are certain indications to the contrary; but the principal entrance to the later Roman London must have been by Newgate. A fragment of the road which crossed the City diagonally from Newgate towards the great bridge over the Thames still bears its ancient name; but even here the Watling Street is not quite on the original site. The exact date of the alteration to which Newgate owes its existence will now, in all probability, never be known. It must have been after the Roman occupation of Britain, but that is all we can say with certainty. Of Newgate itself, however, it will be safe to assert that it was first built when the Romans made their new wall to take in not only the ancient city, but also its suburbs. Even here, too, the exact date eludes us, but it must have been between the time of Julian the Apostate and that of Valentinian, or in the ten years between A.D. 360 and 370.

To account for the name "New" as applied to this ancient gate we must come nearly a millennium further down the stream of history. A mistake of Stow's on this head has been repeated again and again. He asserts that the enlargement of St. Paul's so obstructed the highway that passengers had to go round by Paternoster Row to reach Ludgate. In reality the enlargement eastward of St. Paul's did obstruct the Watling Street and cut it off from its western extremity, now Newgate Street. But though this synchronises very well with the rebuilding of the old gate towards Holborn in the reign of Henry I. or Stephen, it by no means follows that it was caused by it. The road through Newgate existed before St. Paul's itself. But Stow and many other writers since his time believed that Ludgate was called after King Lud; and if any one nowadays is of this opinion, all the other improbabilities and inconsistencies of the story are as nothing. It is curious to observe that, if the "New" gate is one of the two oldest, the "Ald" gate is absolutely the newest of all. Newgate was called "new" with reference to Aldgate, which was built at the time when a bridge over the Lea at Stratford made an exit necessary to the eastward of Bishopsgate. Shortly after, within the lifetime of one generation, the Chamberlain's Gate was rebuilt, and the Chamberlain himself having been forgotten, his gate usurped the then waning newness of Aldgate. This Chamberlain was, of course, the same William who held of the King at the time of the Domesday survey a vineyard at "Holeburne," probably on or close to the site of the Charterhouse, and therefore not very far from the gate.

The Roman fashion of making gaols of gates was imported into Britain from the East, and in the present case has probably, with little intermission, prevailed ever since. Ludgate was also a prison—a "free prison," says Stow, referring, of course, to its use for the freemen of the City. Newgate was to some extent appropriated to the use of the inhabitants of the adjoining county of Middlesex, which about the time of the first rebuilding had been granted in farm to the citizens. The inconvenience of the gaol as population increased caused the many complaints which appear in the pages of every London historian. So far back as 1419 there is an entry in the Letter-book of the Corporation, quoted by Riley, in which mention is made of the fetid and corrupt atmosphere of "the heynouse gaol of Newgate." Ludgate had been abolished as a prison, and the result was that many "citizens and other reputable persons" were committed to Newgate, and died, "who might have been living, it is said, if they had remained in Ludgate, abiding in peace there." Sir Richard Whittington was mayor at this time, and three years later at his death left money for the improvement of Newgate, "seeing that every person is sovereignly bound to support, and be tender of, the lives of men." There is a view of the gatehouse so improved in the Orace collection. It is taken from Boyley's rare *Herba Parietis*, 1650. The wallflower is represented growing over two of the windows. The whole building was afterwards "improved" by the introduction of classical features and statues. This prison subsisted until it was burnt by the Gordon rioters—the present prison, which had been founded a few years before, being already in part completed on the south side of the gate. The Surgeon's Hall, so celebrated for alleged resuscitations, stood a little further to the south in the Old Bailey, but it was now removed, and a part of the Sessions House stands on the site. A portion, however, of the older building long survived, being the "condemned cells." They had in several senses a right to the name; but, though every humane person, and many besides, spoke or wrote of them with horror, the practice of hanging for felony declined before they were removed or improved. One writer discloses a state of things hardly credible even "sixty years since." The convicts were crowded like sheep in a pen. That these "unhappy beings were not victims to the most malignant diseases" he attributes to the kindness of a late keeper, "who frequently assisted their wants at his own expense." This last sentence reveals conditions horrible to think of, even now. "When Mr. Nield visited this prison, one-half of the prisoners, particularly the women, were miserably poor, and covered (scarcely covered) with rags. This does not appear to be so much the case just at this time." Such was the state of

Newgate so lately as 1815. After several even more shocking details, the writer goes on to say that, in order not to hurry poor wretches out of the world, in strict conformity to the letter of the law, after twenty-four hours, the trials for capital crimes took place on Fridays, as Sunday was not counted a legal day. There is a curious plate in the *Microcosm* of Pugin and Rowlandson, which represents the interior of the chapel in Newgate on the Sunday intervening between trial Friday and execution Monday. It shows eleven felons, two of them women, in a kind of central pew painted black. In the middle of the pew is a table. On the table is a coffin. This was in 1809. There is an account of the burning of the old gatehouse prison in one of Johnson's letters. There were not above a hundred protestants at work, but they were left unmolested. There were no guards to prevent their carrying out their design, "without trepidation, as men lawfully employed in full day. Such," reflects Dr. Johnson, "is the cowardice of a commercial place." Had he lived in Land League times he might have made the same reflection on the cowardice of an agricultural place. It was in the older building, then destroyed, that gaol fever made such terrible ravages. In 1750 the Lord Mayor and two of the judges, and others to the number of sixty, died of it after the sessions. This is the less wonderful, as we read that the prison was inadequately supplied with water. The new prison was at first little better in this respect. Lord George Gordon himself died in it of gaol fever thirteen years after his followers had destroyed the older buildings. Much improvement took place in Newgate shortly after the date of Rowlandson and Pugin's picture, yet in 1828 a visitor notes that thirty condemned persons might be seen in the two wards connected with the Press Yard, and congratulates humanity on the fact that none of them wore irons. It was not until 1817 that any classification of the prisoners was attempted. The coffin at the "condemned sermon" was disused about the same time. Mrs. Fry's exertions on behalf of the female prisoners resulted in great improvements in their condition. She taught them to make stockings and other articles, that by selling them they might improve their prison fare. What that was may be guessed, when it is mentioned as a matter for satisfaction by a visitor in 1825 that a regular allowance of food is "now" made out of City funds.

#### COURIERS.

CAPABLE couriers are a useful class of men, whose services must always be more or less in request; but we fear that, so far as the profits and romance of the profession are concerned, its palmy days are gone by. The courier whom Lever delighted to paint with all the strong sympathies of his intellectual and somewhat sensuous Bohemianism, may have been exaggerated by the novelist's lively fancy; nevertheless, the character had considerable foundation in fact. We remember the accomplished man of the world—refined, too, notwithstanding some touch of brusque rough-and-readiness—who entertained Mr. O'Leary at one of the Dutch towns in the course of that gentleman's wanderings. Mr. O'Leary's host was a bachelor and man of fortune, who, falling into the ways of the aristocrats he travelled with, loved to do things *en seigneur*. His taste in art and cookery was unimpeachable, and he had cultivated it at other people's expense with the easy devotion of a lifetime. His little supper, with its slight but well-selected *menu*, was served to perfection. The wines were in all respects worthy of the dishes. The plate and china were admirable of their kind. Gems by the Dutch painters were suspended on the walls—investments no doubt, which, while they gave pleasure to the shrewd connoisseur in the meantime, might ultimately be parted with at a profit. For the courier of those golden days was always turning "honest" pennies or pounds; and possibly this one, while doing the honours of the wine-flasks, deemed that his guest might propose a deal with him. But Mr. O'Leary, who travelled in light marching order, had no thought of the kind; and abandoned himself with frank unreserve to the cookery, the claret, and the charms of conversation. In conversation his talkative host showed to extreme advantage. He had been everywhere, seen everything, and was acquainted with most people of any mark, at all events by sight or by report. He had a general smattering of all the arts, as of all the European languages, and an inexhaustible fund of anecdotes and recollections. He related his experiences with the adroitness of the practised *raconteur*, who can be dramatically voluble without becoming tiresome. We forget at this moment whether in the course of his confidences he touched upon his own early history. Nor indeed is that of any great consequence, since probably his reminiscences would have been more picturesque than trustworthy. Clearly he was a man of parts and ambition, like many more of his class; and he might have made his way to some distinction in other callings than that of which he was an ornament. But the road in those days had irresistible attractions for roving spirits in love with adventure, who were philosophical enough to put false pride in their pockets, and not stand too nicely on the semblance of gentility.

Con Oregan, another of Lever's heroes, puts its advantages and recommendations very forcibly when contrasting his own position as grand vizier and dragoman to a rich travelling party with that of the highly-educated young tutor who was an unconsidered member of their suite. The courier carried the bag, and most likely mapped out the tour. At all events, he directed all

the details, and was charged with the everyday outgoings of the budget. There were handsome commissions to be made, according to precedents, on a great, and generally regardless, expenditure. The sumptuous traditions of the leisurely grand tour still survived. Nowadays when a wealthy peer starts *en garçon* for Vienna or St. Petersburg he drives down after dinner to Charing Cross, having sent his man on before with the portmanteaux. Formerly, the long and insufferably tedious diligence journey was out of the question for a man of fashion and ample means. He was absolutely constrained by circumstances to post, and posting meant taking a carriage of his own. The smart travelling chariot, with its light wheels and strong patent axles, was shipped at Dover to be disembarked at Calais. If a gentleman went abroad with his wife and family, there was the lumbering family landau with rumble and banquette; and a *fourgon* to follow, charged with the heavy luggage. So stately a progress was necessarily leisurely. Frequent intervals of repose were indispensable; and it was always a question whether the needful horses might be forthcoming, even if an *avant-courier* were sent on ahead. Rich *parvenus* had begun to vie with the old nobility and gentry in their claims for consideration; and they asserted their pretensions by even more reckless expenditure. When one of these formidable processions of vehicles rumbled up the ill-paved high street of the provincial town, it set all the landlords of the place on the alert. The patronage that must infallibly prove so profitable depended on the good word of the courier. And who was the courier? That was the question. Was he a friend of the house, or allied with the opposite establishment? He of the "Silver Lion" had his ambition gratified and his apprehensions set at rest when he recognized his good friend and gossip M. Jacques sitting in smiling dignity in the banquettes of the leading carriage. The host had plenty of salutations and ceremonious observance at the service of M. Jacques's master, but the real homage was for M. Jacques himself. In lively gratitude for favours immediate and to come he danced obsequious attendance on that pleasant-mannered functionary. M. Jacques, if he were in amiable mood, behaved to the landlord with good-humoured tyranny, issuing peremptory orders with a cordial manner. As to his own personal comforts some slight and half-jocular reminders were sufficient. His tastes were sure to be consulted in any case and his lightest wishes anticipated. The landlord requested his good friend's company at a little supper in his private apartment, which he hoped might merit his approbation. The repast sent up to the travellers might do credit to the preparing of that little supper. Milord might approve the Bordeaux or Burgundy that would figure handsomely in tomorrow's note, but it was the host himself who had fetched the particular seal for the courier from the reserved binn in the innermost corner of the cellar. We cannot profess to speak positively as to the arrangements, tacit or express, between the confederates in drawing up the bill; but we should do the intelligence of M. Jacques gross injustice if we did not assume that his interests were liberally considered, and in the course of a circular posting-tour through the kingdoms of Europe the sum-total of his pickings must have amounted to something handsome. He lived on the best while laying by for investment. He exercised that authority over his nominal superiors which is perhaps one of the most agreeable forms of arbitrary power. He enjoyed constant change of scene and society, and had every opportunity of cultivating and gratifying his artistic tastes; and while reaping a richer harvest than usual during a prolonged residence in one of the great cities, he kept company in the couriers' rooms with congenial spirits, and had every opportunity besides for the pursuit of whatever amusements he preferred.

We do not doubt that there are couriers who even now do very fairly in a pecuniary point of view, but the profession has been shorn of its best perquisites and the better part of its attractions. Couriers have suffered in common with Queen's messengers, banditti, &c., and all the gentlemen who used to get a comfortable living on the road. Much must still depend on their employers, and occasionally there are respectable prizes to be drawn. The man is comparatively to be envied who is charged with the guardianship of some rich or timid elderly lady who comes to lean upon her counsellor with childlike confidence. He settles her stopping-places for her and arranges the scale and manner of her living. She is trained to accept his estimates as a matter of course, and does her utmost to make the journey agreeable to him and to keep his temper at "set fair." Should she show any disquieting symptoms of wayward independence, a courteous but significant intonation of the voice, or "a flash" of silence more expressive than words, should be quite sufficient to reduce her to obedience. And so an intelligent courier ought to do well for himself when he goes abroad with the custody of a newly-married couple, especially if they should be innocent of Continental ways. The turtle-doves are so engrossed with their billing and cooing that they have no thought to spare for sublimity matters. They are but too grateful to the factotum who takes all trouble off their hands. The husband, who is still the devoted lover, thinks nothing too good for the object of his adoration. He strives to make each successive day a fête, and is apt to value the tributes he offers by the prices he pays. Naturally the courier, who is the minister of their pleasures, is ready enough to meet his views in that respect; and the man knows besides that a young husband in the first stages of the honeymoon hesitates to haggle on questions of money. He would rather submit to be plundered with a good grace than have

the air of appearing mean and miserly. But such exceptional chances of good luck as these can fall to but few of the courier fraternity. As a rule, they must content themselves in the main with the hard and fast terms of their engagement, while their time-honoured perquisites have been suppressed or reduced by the publicity given to travelling charges under the new order of things. A family bound for Rome or the Engadine may engage a travelling servant to act as interpreter and look after the luggage. But a glance at the opening pages of Bradshaw gives a bird's-eye estimate of the cost of the journey, approximating very nearly to the truth; and even the luggage-tickets, should one choose to examine them, show precisely the over-tax for extra weight. As for the hotel bills, they may be more or less elastic; still the average cost of most of the ordinary items have come to be matters of general notoriety. Thus there is a fixed charge for dinner at the *table-d'hôte*; and even a wealthy man with a head on his shoulders knows the usual price of a plain breakfast and luncheon; and probably he may have the greater objection to being cheated because his means notoriously afford ample margin for pillaging. Wines, be they bad or good, are classified upon wine lists with the figures attached; and many of the grand establishments have introduced the innovation of ticketing the price of each separate apartment on its walls. The consequence is that the courier of the present day is more of a servant and less of a man of the world than of old. But, in the absence of the former temptations to dexterous feats in financing, doubtless the profession has gained in respectability, since couriers can more easily afford the luxury of a conscience. Had it still offered its old inducements to somewhat unscrupulous adventure and ambition, we might have seen in those days of overcrowded careers a movement for an institution of gentlemen-couriers corresponding to that for lady-helps. As it is, the best opening it seems to offer to talents and energy is the prospect, after acquiring a *clientèle* and some knowledge of the world, of marrying an elderly lady's-maid with savings, and embarking their joint fortunes in an hotel or a fashionable lodging-house.

#### WHITTINGTON AND HIS CAT.

THE researches of students and antiquaries throw so much light nowadays upon obscure biographies that it is unsafe to predict that the most cherished hero of tradition will not turn out an impostor, or that the most mythical of legendary knights may not be rehabilitated and become a respectable historical personage. One of the stories most dear to English youth, and hallowed by the associations of old rhymes and picture-books, is that of Dick Whittington and his Cat. When Mr. Besant, charming novelist but inexorable historian as he is, undertook, in conjunction with Mr. Rice, to tell, in the "New Plutarch" series, the real facts about the life of the famous civic hero, we feared that we were going to lose another friend of our childhood; and that if, haply, the knight who was thrice Lord Mayor of London were spared us, the cat would be ruthlessly consigned to the limbo of popular superstitions. We are happy to say that these dark forebodings have not been realized, and that both Whittington and his Cat are proved to be most respectable, if not exactly prosaic, entities. It may be as well to remind the reader, in the first place, of the legendary history. One Richard Whittington, supposed to have been an outcast, for he did not know his parents, ran away from his tyrannical nurse and came to London, the streets of which he had been taught to believe were paved with gold. After two hungry days, and lying on the bulks at night, weary and faint, he got to a merchant's house in Leadenhall Street, where he made many signs of his distressed condition. The cook declared that if he tarried there she would kick him into the kennel; but the master, one Mr. Fitz-Warren, behaved in a more humane manner, and gave him employment as a scullion in his kitchen. Being a well-favoured young fellow, he attracted the attention of his master's daughter, Mistress Alice; but all the delicate kindness the young lady could show was counteracted by the cruelty of the churlish cook-maid, who not only subjected him to all kinds of ignominy, but caused him to lie by night in an unfrequented place, overrun by rats and mice, which caused him much annoyance and suffering. At length, with a penny which he had earned by cleaning the boots of one of his master's guests, he bought a cat which henceforth became the comfort and solace of his existence. Not long after this event his master, Mr. Fitz-Warren, adventured a ship to foreign parts, and, as was his wont, invited each of his servants to send something on it to try their fortunes, for which they were to pay neither freight nor custom. Whittington, amidst the jeers of his fellow-servants, proffered his cat, which the captain took with him, and proceeded on his voyage by way of Blackwall. The cook-maid's tyranny, however, became insupportable, and Dick Whittington made up his mind to run away; so, having packed up his little bundle overnight, he set off on All Hallows' Day to ramble over the country. But as he went through Moorfields, he fell into a pensive mood, and his resolution began to fail. Arriving at last at Holloway, he on a sudden heard Bow Bells ring out a merry peal, and the words they seemed to sing were—

Turn again, Whittington,  
Lord Mayor of London.

So strong an impression did this make upon his mind that he hurried back, reached his master's house before any one was astir, and got to his usual drudgery. In the meantime the ship had been

driven on to the coast of Barbary, inhabited by the Moors, unknown to the English; but finding the people courteous, the captain and factor traded with them, and the King was so pleased with their wares that he gave the ship's officers an entertainment in his palace. A magnificent repast was spread upon the ground, but was immediately invaded by rats and mice, which devoured all that came in their way. The story goes on to tell how the King purchased Whittington's cat for a fabulous sum, and how the fortunate youth married his master's daughter, became one of London's richest merchants, and was thrice Lord Mayor of the greatest city in the world.

As might be expected, much of this popular legend proves to be pure romance, but the central facts are undoubtedly true. Whittington, instead of being a friendless, nameless adventurer, was of gentle blood; his father was a knight and a country squire, who died in 1360, leaving three sons, of whom Richard, the hero of the legend, was the youngest; the oldest succeeded to the property, which was not of very great value, the second stayed upon the estate to act as a sort of bailiff to his brother, and the young Richard was apprenticed to a wealthy London merchant, Sir John Fitz-Warren, himself a connexion of the Whittington family. No authentic information exists as to the steps by which Dick Whittington arrived at success. The cat story has been laughed at and explained away by various writers; but Dr. Lysons, an antiquary who has occupied himself with very extensive and learned researches upon this very subject, comes to the conclusion that it is in the main true. The legend is not confined to London, but is told of one Alphonso, a Portuguese, who, being wrecked on the coast of Guinea, and presented by the King thereof with his weight in gold for a cat to kill their mice and ointment to kill their flies, improved his fortune so rapidly that he returned to Portugal, after fifteen years' traffic, the third man in the kingdom. The first cat taken to South America was also purchased by one Diego Almagro for 600 pieces of eight, and similar legends occur in Persian and Scandinavian literature. But, so far from the fact that the story is so common proving its absurdity, Dr. Lysons is of opinion that it tends rather to show the probability that there may have been some foundation for it in reality. Cats have in many countries had great value. An early traveller in South Guinea confirms the statement that they are much prized by the blacks for ridding their houses of the rats and mice which infest them. Gregory the Great, when he retired to a convent, took nothing with him but a cat; and there is a tradition that Mohammed used to carry a cat about with him in his sleeve. Arabian works contain some amusing stories about the same animal. A Bedouin Arab who had never seen one before found a cat while upon his travels, and asked every one he met what the creature was called, offering at the same time to sell it. Now it so happens that in the Arabic language there are a vast number of names for a cat, and one person would tell the man that it was a *sinnaur*, another declared it to be a *cott*, a third styled it a *hirreh*, and so on, but no one seemed inclined to make a bid for its possession. This so annoyed the man that he threw his find away, cursing it for "a beast of many names and little worth." In another anecdote the cat has a higher value assigned to it. A Bedouin had lost his camel, and vowed that, if he found her again, he would sell her for a *dirhem* or groat. Finding her shortly afterwards, he repented of his rash vow, and endeavoured to "hedge" with his conscience by tying a cat upon the camel's neck, and proclaiming that the camel was for sale for a *dirhem*, but any intending purchaser must take the cat as well, at the price of a hundred dinars—over forty pounds—for he could not sell the two separately. In ancient Egypt it is well known that the cat was regarded with extraordinary respect; it was one of the forms under which Isis was worshipped, and mummies of the animal are often found at the present day in the tombs and catacombs which are so common in the land of the Pharaohs. Thus there appears to be no initial objection to the story on the ground of the value or usefulness of the cat. Other suggestions have been made to account for the tale. One is that the word "cat" is a corruption of the French *achat*, a purchase; and another theory is that, since colliers and ships employed in the carriage of sea coal to London were called "cats," one of these may have been the foundation of Dick Whittington's fortunes.

Of all these objections Mr. Besant disposes in a very complete manner. By the rules of the language *achats* could never have become *cats*, but rather "ashats" or "ashets." As for the sea-coal view, he shows that ships of the description of the "cat" could not have been built in those days, and that, moreover, the objection to coal fires in London was so strong at the time, while coal did not become an important article of trade until two hundred years later, that it is highly improbable that Richard Whittington, a mercer, should have dabbled in so unpopular and unremunerative a trade outside his own. On the other hand, all the pictorial and architectural relics of Whittington represent him with the cat. A portrait which used to exist in the Mercers' Hall, dated 1536, represented him as a man of sixty years of age, in a free livery gown and black cap, and having a black and white cat at his left hand. In another portrait which exists, dated 1590, he is also represented with his hand resting upon a cat. And, what is more to the purpose, when the executors of Whittington, in accordance with the great merchant's will, pulled down and rebuilt Newgate, one of the figures which adorned the gate, as we learn from Maitland's *History of London*, represented Liberty, with the figure of a cat lying at his feet; alluding to Sir Richard Whittington, a former founder, who

is said to have made the first step to his good fortune by a cat. The strongest fact of all, however, is that the Whittingtons had a house in Gloucester, which they occupied until the year 1460, and in some recent excavations in the cellars of this building there was found a stone, probably part of a chimney, representing in *baso-relievo* the figure of a boy carrying in his arms a cat. The workmanship appears to be of the fifteenth century, so that the discovery affords proof that the family of Whittington in his own century believed the cat story. Mr. Besant's conclusion from all this is that Whittington, knowing that a cat was a valuable animal, did actually make his first venture while an apprentice by sending one out; that the cat sold well, and the profit gave him money and encouragement for other investments, and thus laid the foundation of his fortunes. The sentimental part of the story, which makes Dick Whittington weep at parting with his pet, would seem to be of a piece with the legend of his lowly birth, and due to popular exaggeration and misconception.

But if the early part of Whittington's career is involved in comparative obscurity, his public life is clear enough, for he figures in the annals of the City during a long period as an important merchant and civic officer, and served as Lord Mayor in 1396 and 1397, and again in the year 1419. In 1416 he was returned as member of Parliament for the City. It was in his last mayoralty that Whittington entertained Henry of Agincourt and his queen. "The magnificence of this banquet astonished both the King and his bride; probably there was not, in all England and France together, another man who could have provided such a banquet. . . . Even the fires were fed with cedar and perfumed wood. When Catherine spoke of it, the Mayor proposed to feed the flames with something still more costly and valuable; and, in fact, he threw into the fire the King's own bonds, to the amount of 60,000*l*. Among the bonds were some, to the amount of 10,000 marks, due to the Mercers' Company; one of 1,500 marks, due to the Chamber of London; one of 2,000 marks, belonging to the Grocers; and all Whittington's private loans and advances. It is probable," says Mr. Besant, "that in burning these bonds the Mayor acted by previous agreement of the City; but if not—if he took on himself the loans due to the Companies—he made a most splendid and princely gift. The sum of 60,000*l*. advanced by one man would, even in those days, be considered enormous; in those days it can hardly be reckoned as less than a million and a quarter of our present money."

Sir Richard Whittington died in 1423, leaving to the City which he had served so long and so well an immense number of munificent benefactions, which serve to keep his memory green until the present day. In the course of the work which Mr. Walter Besant devotes to the life and legend of the famous Lord Mayor, he gives some most interesting details about the ancient City life and history, a notice of which we must reserve for another occasion. In the meantime, we have seldom met with a pleasanter memoir than that from which the facts given above are extracted; and, if the legend loses something of its more romantic features, the true story is an interesting contribution to archaeological knowledge and an excellent example of a good and useful life.

#### INCONVENIENCES OF MILITARY REFORM.

NOT long ago we called attention to the increased educational demands which are now made on the British officer, and which have been necessitated by the rapid march of military science. We gave in detail the nature of the examinations which have to be passed by each rank, and we remarked on the fact that no amount of good service in the field will, according to the General Order, be allowed, as heretofore, to serve in lieu of examination, but that all must pass before they can hope for advancement in the service. This is doubtless right and proper; for the principal feature of modern war is the responsibility which may at any moment devolve upon subordinates; and to allow an army to take the field with uninstructed officers would be simply suicidal. Let us, therefore, by all means have our officers professionally educated to as high a standard as possible; but, at the same time, unless we are much mistaken, there is a somewhat serious question connected with this subject which will present itself before very long.

Before beginning to discuss it, we must first of all consider the relations which exist between the British officer and the State which employs him. They are very far from being the relations which usually exist between employer and servant. When the Royal Commission on promotion and retirement was sitting, one of its chief difficulties was found in the fact that inquiry into the systems of promotion and retirement in force in foreign armies was useless, inasmuch as the position of our officers has no parallel in any army in the world. It is peculiar and unique. With us, officers enter the service of their own free will, and leave it whenever they choose. The scale of pay which they receive for their services was fixed at some remote period in our military history, and has remained stationary ever since, while its purchasing power has diminished about threefold. But not merely does the British officer serve for wages that are confessedly and notoriously inadequate; he does even more, for out of his own pocket he relieves the taxpayer of what in every other country is a serious burden—he finds his own uniform, his own chargers and horse furniture, and he provides

nearly the whole of the money necessary to maintain the regimental band at a proper and respectable pitch of efficiency. In addition to this, he supports the national credit and reputation for hospitality in distant colonies and possessions in a manner which few people who live at home have any idea of, and to an extent which he can often but ill afford. Now it is not to be supposed that all this has been done by our officers without a *quid pro quo*. We cannot sum up the matter better than by saying that there has hitherto existed a kind of tacit understanding between the State and the officers, by which the latter enjoyed, as compensation for inadequate pay and heavy expenses, immunity from hard work, a liberal annual allowance of leave, and the prestige and position which formerly attached to the Queen's commission. Such was virtually the compact between the two parties—a compact which was alike unwritten and unrecognized, but which nevertheless, like many other arrangements of a similar nature, worked well and to the satisfaction of both. The bargain, however, begins to show symptoms of becoming decidedly one-sided. Circumstances have rendered it necessary for the State to exact more work than formerly, and the quantity seems to be increasing with alarming rapidity. The establishment of officers is, from considerations of economy, maintained at so low a figure as frequently to reduce the amount of leave annually granted; while the Militia and Volunteers have flooded the country with military titles, thus impairing alike their professional and their social value.

Altogether the prospects of the officer are becoming somewhat unpleasant; and, if we look further into them, they appear even worse. Our readers may remember that, when purchase was abolished, the immediate result was an utter stagnation of promotion, which attained to such a pitch that a Royal Commission was assembled to inquire into the matter; and it was stated in the Report of this Commission that, unless some means were devised to maintain promotion, a great injustice would be committed. Accordingly compulsory retirement for all who might be captains at the age of forty was instituted. Thus, not merely does the officer find the amount of work demanded from him nearly doubled, but he has also the agreeable prospect before him of finding that the whole of this work may be absolutely wasted, inasmuch as he may be turned adrift before he becomes a major. More than this, he has the satisfaction of knowing that the greater portion, if not all, of the said work is of a nature that will be useless to him in any other profession. With regard to leave, we have already remarked that the incessant detaching of officers from their regiments, and the small establishments maintained, are gradually reducing the amount hitherto enjoyed. We are quite aware that many would-be military reformers have called attention to the large amount of leave granted to our officers, and have pointed out that the authorized two months and a half in the winter with a casual fortnight in the summer is far in excess of that allowed to any other department in her Majesty's service. No doubt it is; no doubt also that officers should work; but at the same time there are two sides to the question. It is easy for reformers to declare that the nation has a right to demand harder work, a more moderate allowance of leave, and a cheerful resignation to summary dismissal on a small pension, combined with a feeling of gratitude that the pension is not smaller still; but the real question, we submit, is—Is the nation prepared to pay for it? It is all very well to say that when purchase was abolished we bought back our army at a heavy price in order to be free to do with it and to manage it as we choose. The rising generation of the class from which our officers are drawn can also do as they choose, and may decline to join the army at all. It is merely the old saying over again, "The labourer is worthy of his hire." Hitherto the balance has been well preserved—that is to say, there has been very little labour and very little hire. Now it appears that a good deal of labour is demanded for the same hire, and we doubt whether labourers will continue to come forward much longer on such terms. The Radical will perhaps reply to this, "Very good; we will in future draw our officers from the ranks." To which the officer of the present may retort, "Certainly you can; but you will only make the army dearer than ever; for, setting aside all considerations of discipline and efficiency, you cannot lower the present rate of pay; besides which, you must furnish your officers with uniform and equipment, and maintain your own bands." With reference to this matter, we may remark in passing that the chevrons or stripes which have heretofore been worn by sergeants of fusilier and light infantry corps on both arms are in future only to be worn on one arm, and, according to a military contemporary, the saving effected by this alone will amount to several thousands annually. Our readers may therefore judge for themselves what would be the expense of providing officers' uniforms. It would be simply immense, and would swell our already inflated military estimates to an extent which the taxpayer would little relish.

Let us now turn for a moment to the ranks. Here we find the same system at work. The educational demands made upon the soldier are increasing daily, and their variety seems to be boundless. In the good old days he had, like the officer, little or nothing to learn besides his drill; but now the case is very different. When a recruit joins he finds the drill sergeant, the musketry instructor, the gymnastic instructor, the schoolmaster, the signalling instructor, and the instructor in trench and field work drill all waiting for him; and he has to work in a manner which would have astonished his professional predecessors. Certainly the case of the soldier is not quite so bad as that of the officer, for the pay of the men has received additions of late years, their rations of meat and bread have been given them free of expense, and other concessions have

been made. It must also be remembered that a considerable portion of their clothing is provided by the Government, and altogether they are, as regards remuneration, relatively better off than the officers. Here, again, the arguments already used apply equally. It is useless to urge, as we have seen it urged, that our men even now do not work nearly so hard as their Continental brethren in arms. There is no parallelism in the two cases, owing to the difference between compulsory and voluntary service. It is an admitted axiom that the inhabitants of every country must pay for the defence of that country either in purse or person. The freeborn Briton refuses to pay in person, and it is somewhat difficult to make him understand that he must therefore pay in purse. He would infinitely prefer to do neither; but he cannot always have his own way. The art of war is daily becoming more complex, more scientific, and more exacting in its educational demands upon soldiers of every grade. We must keep pace with the times, and officers and men must and do work now as they never worked before; but at the same time the public should not forget that both are serving voluntarily, and that the question of remuneration may before very long present itself in a forcible manner.

We cannot conclude better than by pointing out that the pressure of work upon all ranks might be materially modified if the authorities could only be induced to keep our regiments at home up to a respectable establishment. We feel satisfied that all ranks fully appreciate the importance and the necessity of increased study; but where the shoe really pinches is in the knowledge that every one is doing the work not of one man, but of two or three. The military duties, the work, the drill, and in fact the whole professional routine of the service, are based upon a fallacy—namely, that our regiments are really regiments in anything but name. They are maintained at such low strength that when the men on guard, the sick, and the parties at musketry or other instruction are deducted, there is nothing but the band left. In addition to this, captains have to do the work of majors, subalterns of captains, sergeants of subalterns, and so on. It is quite true that after a due amount of service and experience in a certain rank the person holding it should be qualified to perform the duties of the next higher grade; but when this state of things becomes the rule, not the exception, not merely does the work become intolerably heavy, but efficiency suffers. Everything has an air of unreality and makeshift, loose habits creep in, and discipline deteriorates. The work which is now demanded both from officers and men might be materially lightened if we only had battalions approaching to their proper establishment. If we continue as we are now doing we shall assuredly some day find ourselves either compelled to raise the pay of all ranks, or to go without an army altogether.

#### THE PRISONS ACT.

THE Prisons Act of 1877 is not a measure that has brought the Government which passed it any increase of reputation. It offended the local magistracy, because it deprived them of some petty authority, and it did not interest philanthropists. Considering that those who up till that time had administered prisons disliked the Bill, and that those who before and since that time have preached about prisons were indifferent to it, the Government might think themselves fortunate that they were able to carry it through Parliament. Yet this friendless and unimposing Act has really been rich in valuable results. Down to 1877 there were some very good prisons, and a great number of very bad ones. It was natural that the authorities who had made their prisons good should think it a poor reward to have these very prisons taken out of their hands. Yet this was really the best reward that they could hope for. It was a formal recognition that their methods of administration were so good that they deserved to be made the standard for the whole country. Thereupon the suppression of the authorities whose labours had been thus approved became a necessity. There are only two principles on which prisons can be managed—the principle of leaving each prison, good, bad, or indifferent, to be a law to itself, and the principle of vesting them all in the hands of a central authority. It might have been convenient, no doubt, to leave the good prisons to be managed by the authorities which had made them good, and merely to take over the management of the bad prisons. But no one who knows the difficulty of dealing with any question which involves local independence will think that such a course could possibly have been taken. The idea of bringing all the prisons in the country under one and the same administration did so far approve itself to Parliament that the Bill became law. If any prisons had remained outside the scope of the Bill the discussion would at once have become a series of recriminations between one Board of Visiting Justices and another.

The third Report of the Prison Commissioners shows the nature of the reforms which have been effected during the three years during which the Act has been in operation. It may be well to point out that these reforms are not of a kind from which any striking change in the character or statistics of crime is to be looked for. The first object of the Act was to introduce uniformity into the treatment of prisoners. Hereafter observation and experience may enable the Commissioners to make this uniform treatment more effectual for its purpose. But before the good methods of treatment could be made better the bad methods of treatment had to be made good. On the 1st of April, 1878, the Commissioners took possession of 113 gaols of all imaginable

degrees of merit or demerit, and they had at once to devise measures for the introduction of a sound prison system into as many of these as they were minded to retain. The first step in this process was to reduce the number of gaols. A very small prison is almost inevitably a bad one. There are neither the funds nor the experience which can alone make a gaol anything else than an unimproved descendant of the local lock-up house. Out of these 113 prisons 46 have been closed. Of how little use many of these disused gaols were may be judged from the fact that the 67 which remain have room for 26,095, while the whole 113 had only room for 27,213. At present the amount of accommodation is fully sufficient for the demand; the largest known number of persons in prison at one time being only 20,773. The saving of public money resulting from the suppression of these useless prisons is considerable. It is known to be 30,000*l.*; it is believed to be a good deal more. Besides the pay of the officers in the disused prisons there was much irregular expenditure in the shape of allowances from prison stores and permission to use prison labour. A curious commentary on the public spirit of the local authorities is supplied by the fact that they very largely increased the pay of their staffs after they knew that the Government were going to take over the prisons. Their regard for the pockets of the ratepayers did not extend to the pockets of the taxpayers. Financial patriotism seems to begin and end at home. The rates are not regarded as fair game; the taxes are. This is not the only saving that has been effected by the transfer of the prisons to the Government. The cost of food is now less by 16,000*l.*, the cost of medicine and sick allowances is less by 4,400*l.* The Government keeps the prisons in repair for 11,000*l.* a year less than it cost the local authorities to do it. There is a further saving of 17,651*l.* yearly under the head of "other establishment charges." If this were the only improvement consequent on the Act it would well repay the time spent in passing it. If criminals remain criminals, and there is no diminution in the supply of fresh ones, it is still something that they should cost us less. Of course these savings might conceivably have been made at a sacrifice of humanity. The prisoners might have cost less because they were less well cared for. Instead of this, the health of the prisoners has improved under the new system. The Commissioners take just credit to themselves for the fact that the death-rate for the years 1878-79 and 1879-80 was lower than that of previous years. The winters of both these years were exceptionally cold, and long periods of cold usually tell with great severity upon the criminal class. There could not be a better test of the wisdom of the changes in diet and punishment introduced by the Commissioners than a positive decrease in prison mortality at a time when an increase might naturally have been looked for.

It must be admitted, however, that all these reforms, valuable as they are in their place, do but touch the fringe of the great question to which they relate. We have not yet found means to make imprisonment either really reformatory or really deterrent; at all events, neither result has been attained except in a very imperfect degree. Upon these heads the last Report of the Howard Association contains a novel suggestion. The origin of them is to be found in the remark commonly made by convicts on entering prison, "I have never yet worked hard for my living, and nothing shall make me do so." Here we seem to see at once the cause which brings men to prison and the direction which their treatment while in prison should take. A poor man who is resolved not to work hard for his living must, if he carries out his resolution, live more or less by crime. Money will not fall into his mouth as he lies idle in the sun, and the only choice open to him is to earn it or to steal it. If the prison could be made a place of real labour, two good ends might be considerably helped on. The thief who has taken to dishonesty rather than work hard would know that if he got caught—and caught sooner or later he almost always is—he would have to work harder than he ever need do if he led an honest life; and the distaste for hard work might to some extent be lessened by the influence of custom. Thus he would see more in imprisonment to dislike beforehand, while with the habits learned in prison, there would be some chance that he would alter his way of life when he came out. According to the Report of the Howard Association, the labour done even in the convict prisons is often very far from hard. At Portland, for example, "the convict hardly gets through as much in a week, notwithstanding his diet of animal food and cocoa, as many a poor free labourer outside does in a day or two upon food more scanty." The convicts have no motive to work hard, because their term of imprisonment is neither shortened by industry nor lengthened by idleness. The Report suggests that a sentence of penal servitude or imprisonment should not, as now, be a sentence to be imprisoned for so many years or months, but a sentence to do so much work, and to be imprisoned until it is done. Thus, supposing that it would take an ordinary navvy five years to quarry so much stone, or to excavate so much earth, the doing of this amount of labour should be the penalty imposed where now five years' penal servitude is imposed. Whether the prisoner got through this quantity of work in five years or less would be left to himself; but he would not be let out of prison until he had got through it. The knowledge that every hour's additional work brought him an hour nearer to the end of his sentence, that he could hasten that end by industry, and that he would certainly postpone it by idleness, would be the most effectual of inducements to work hard; and there might be at least a hope that a man who had yielded to this inducement for a considerable time would hate hard work a little less when he

was once more at liberty. If, on the contrary, he hated it more than ever, he would have an additional motive for not exposing himself to it again. Occasionally, perhaps, the dislike to work would be so great that, rather than do it, a prisoner might be willing to remain in confinement all his life. Cases of this sort might be partly met by a provision that, unless a certain amount of work was got through in each day, the prisoner's diet should be lowered. The community is bound to keep its prisoners in health, but it is not bound to give them while they are idle the food which is needed while they are working hard. This principle of apportioning labour by way of punishment would be applicable to all kinds of prisons and all varieties of work, and, considering how unsuccessful the present prison system has proved from whatever point of view it is regarded, there is every reason why another plan should be tried. The suggestions of the Howard Association point to a new departure of real value. It is no doubt true that "they may need years of advocacy before they are carried into effect," but that is but the common lot of really useful reforms.

#### THE COURSE OF PRICES ON THE STOCK EXCHANGE.

THE course of prices on the Stock Exchange since the beginning of the year has been very different from what it was expected to be nine or ten months ago. It then seemed probable that the speculation which had carried prices so much upwards during the previous fifteen or sixteen months would continue during the year that was about to begin. The expectation seemed to be based upon sound grounds. In the first place, money was very cheap and promised to remain so. The United States had taken about 16 millions sterling in gold from Europe during the autumn, but the drain had very little enhanced the value of money in the London market, the Bank of France having refused to raise its rate of discount, and consequently the drain fell chiefly upon France. The amount of gold which had gone from Europe to the United States in the previous year and a half made it highly probable that no further demand for the United States would arise for at least eight or nine months to come, and that the London money market would remain very easy. Speculators, therefore, looked forward to being able to borrow on very favourable terms. In addition to this, the improvement in trade which had begun in September 1879, continued—slowly, it is true, but still continued. And as the harvest of 1880 was considerably better than that of 1879, it was hoped that the improvement in the new year would be still more rapid, inasmuch as the agricultural population would be better off than they had been. A still further reason for expecting a rise in prices was the great reduction that was going on in first-class securities. The United States Government, for instance, was not only reducing the interest upon its debt, but was also redeeming the principal at a very rapid rate. Both processes were taking away stock which had been largely held in Europe, and the inference was that, since no new stock of equally good security was being created to take its place, the prices of existing stocks must go on rising. Moreover, our own Government also was reducing its debt by the reappearance of a surplus and by means of the terminable annuities which will lapse in 1885. Lastly, there was a very strong speculative feeling, not only here, but all over the Continent and in the United States. It had first made itself felt in the United States, and the great prosperity which was being there enjoyed made it probable that it would gain volume in the current year. In France, also, there seemed every reason to suppose that speculation would be carried further. The Government, in its desire to ingratiate itself with the capitalist classes, had induced the Bank of France to allow its gold reserve to be drained away rather than make money dear in the Paris market; and, as the elections for the Chamber of Deputies were to be held this autumn, it was considered certain that the same policy would prevail all through the present year, and that money in consequence would be kept artificially cheap, while there was no reason to expect political disturbances of any kind. For all these reasons, therefore, a steady and considerable rise of prices in the current year was expected at its commencement.

The course of events, however, has been different. It is true, indeed, that money has remained very cheap until about a month ago—abnormally and even unexpectedly cheap. The policy pursued by the Bank of France, to which we have already referred, had made that inevitable, and the slowness with which trade has improved had also prevented an eager demand for accommodation for commercial purposes. Even the new issues of all kinds which came out in such numbers in the first half of the year failed to enhance perceptibly the value of money. Trade also continued to improve—very slowly indeed, but yet unmistakably. Nevertheless, prices, as we shall presently show, have not advanced since the beginning of the year. The first check to speculation was given by the alarm taken by bankers in the month of January. The height to which prices had been carried in less than a year and a half led them to fear that the speculators were overpassing the bounds of prudence, and that it was incumbent upon themselves to apply the curb. They therefore showed an unwillingness to lend for speculative purposes, which caused a considerable drop in prices in January, and this drop received additional importance from the severe weather which almost immediately followed. At the meetings of the various railway Companies which have been held since the beginning of July reference has

been made to the loss of earnings and increase of cost caused by that severe weather. In fact, for some time out-of-door occupation was rendered impossible over a great part of the country, locomotion was seriously impeded, and trade was greatly hindered. There was, in consequence, a serious falling off in the traffic of the railways, while the expense to which they were put was severely augmented. The prospects of the railways for the year were consequently rendered less good than had been expected; and speculators, already alarmed by the difficulties raised by bankers to making advances, lost courage, and a heavy fall was the result. The value of money instantly declined, and bankers soon became as willing to lend again as they had been immediately before nervous and unwilling; but, when speculators were once more recovering courage, their hopes were dashed by untoward political events. The assassination of the Osar had not quite so unfavourable an influence upon the markets as might have been expected; even Russian stocks proved surprisingly steady. Yet it spread a very general feeling of uncertainty and distrust. People wished to know what would be the effect upon the relations between Russia on the one hand, and Germany and Austria on the other, before they committed themselves to heavy new engagements. There was also uneasiness as to what the Nihilists, who had proved themselves so formidable, might next undertake. The disquietude thus caused had scarcely passed away before the French expedition to Tunis generated a still worse state of feeling. Speculators had counted upon France more certainly than upon any other Power in Europe, for maintaining peace. In the first place, the cautious, prudent conduct pursued by all French Governments since the close of the Franco-German war had spread the belief that France was at length cured of her passion for military glory. In the second place, the anxiety shown by the present Ministry to keep money cheap, and to ingratiate itself with the capitalist classes, had still further strengthened the conviction that everything would be done to make matters pleasant for moneyed men. The expedition to Tunis shook this belief, and the ill feeling awakened in Italy and Spain, with the fears that prevailed for a time of a collision between France and Italy, had a very adverse effect upon the stock markets. Then came the war of rates between the trunk railways in the United States, which, by cutting down the earnings of the lines, threatened to deprive some amongst them of the means of paying dividends, and in all cases to reduce the rates of dividend. While this war was going on, the attempt upon the President's life was made. Since then the Government of the United States has been to a certain extent disorganized. The Secretary of the Treasury being unable to consult the President and the Cabinet, has been timid in his measures, has not afforded the relief to the New York money market which was expected from him, and has thus helped the party which was speculating for a general fall in securities. All this has necessarily acted against the speculation for the rise. The bad weather both in Europe and in America of the past month or two has dissipated the hope entertained that this year's harvest would be a good one, and has consequently spread fears that the agricultural classes will be worse off than ever, and that the amount of money available for investment will be less than it has been at any time in the past two or three years. Had the harvest here at home been as good as at one time it promised to be, it would of course not have recouped the farmers for their losses during five or six years, but it would have enabled them to pay at least a portion of their debts, and would probably have made further reductions of rent by the landlords unnecessary. The landowners would thus be in a better position, and would have more means for investment in stocks. As it is, however, the landed interest will probably be worse off than it was even last year. In addition to this, the mutiny in Egypt has shaken confidence in the existing state of things, and thus caused a heavy fall in Egyptian bonds. Lastly, the fear of a renewed drain of gold to the United States, and consequently of dear money, is now imposing caution upon speculators.

From all these causes the result is that prices are lower rather than higher, compared with what they were at the end of last year. Consols, for example, this week are barely equal in price to what they were in December last. In the interval they have risen to 103, but they have lost the whole rise, and a week or so ago were actually lower than they were in December. Colonial bonds, again, are lower than they were at the close of last year. In the case of New South Wales Four per Cent. the fall exceeds 2 per cent. Home railways, moreover, are almost all lower than they were ten months ago. North-Eastern Consols are about 10 per cent. lower, Manchester, Sheffield, and Lincoln about 12 per cent., and Caledonian about 9 per cent. The only important rise is in the case of London and North-Western stock, which is about 2 per cent. higher than it was at the close of last year. Railway preference shares and railway debentures have remained almost stationary, and in the case of Indian railways the number of cases in which there is a fall is larger than those in which there is a rise. There is one department, however, in which there is a very general rise, and that is in London banks. Owing to the Glasgow Bank failure, bank shares fell very heavily in the latter part of 1878 and the early part of 1879. Throughout 1880 they rose again, but they did not recover the entire loss consequent on the Glasgow Bank failure, and the rise has therefore continued during the present year. Moreover, the adoption of limited liability by the majority of the banks has made their shares more eligible investments for wealthy people. And, lastly, the prospects of the banks are growing better as every month passes. Not only are the banks doing

a better business than they did last year, but the probability that money will rule higher for the next year or two makes it almost certain that their earnings will continue to increase, and consequently, that they will pay higher rates of dividend. Bank shares generally are therefore higher now than they were at the end of last year, and seem likely to go still higher. In the case of foreign stocks so many various considerations have to be taken into account that it would not be worth while to compare their quotations now and at the end of last year. The credit of the several Governments, the dangers of war, the condition of the countries in question, the accidents of politics, and the relations of one Government with another, all affect prices. To take a single instance, Egyptian stocks have fallen heavily within the last few weeks, because of the mutiny of the army. Confining our attention, then, to home and colonial securities of all kinds, we find that, speaking generally, Government securities, whether home or colonial, and the preference and debenture stocks of the railways have remained almost stationary; but that the ordinary stocks of the home railways are lower now than they were nine months ago, and in some cases considerably lower.

#### HONOUR AT THE COURT THEATRE.

THE words used to express the process by which English plays are made out of French ones would seem to call for a little definition. We hear that a new play has been "adapted" from the French of M. Chose, or is "founded on" it, and the difference in the terms might be supposed to imply some difference in the process. In an adaptation, perhaps, the French would be closely followed; but when the English playwright had the courage to ask nothing from his foreign master but a foundation, then we might be allowed to hope that the building would be his own. As a matter of fact, however, the terms used are a mere distinction without a difference. "Adapted" or "founded on" equally mean, compressed and made decent according to the real or supposed demands of the public. When our native playwright does his work well, enough of the French piece is left to make the new play intelligible; when he compresses by the easy process of cutting off, and sacrifices the dramatic motive of the original to the proprieties, then he produces an absurdity which fails or does not fail according to the whim of the hour, and, in a much less degree, to the skill of the actors.

The play by Mr. Barrymore which is now being played at the Court is, on the whole, a favourable specimen of the adaptor's art. He has kept as much of the original as is really necessary to make an effective dramatic action, and what he has rejected can for the most part be spared. *L'Honneur de la Maison* of MM. Battu and Desvignes, on which Mr. Barrymore has founded *Honour*, is a good specimen of the Porte St. Martin domestic drama. The climax of its gloomy plot is indeed produced by a somewhat too obvious accident, and the inevitable *ingénue* is even less necessary than usual. But after paring away what may be called its superfluous ornaments, enough remains to make a vigorous piece; and perhaps the best way to explain *Honour* is by giving a sketch of the framework of the French play. A certain Elise de Neuville has been seduced and deserted by a friend of her brother's, Georges de Maubreuil, an officer in the army. Immediately after he has left her, an offer of marriage is made to her by a M. Maurice de Chennevières, and by the influence of her mother, who has learnt her secret, Elise is induced to accept him. A son—the son of Georges de Maubreuil—is born seven months after the marriage, and four years later a daughter. Maurice has as yet suspected no evil, but an accident betrays the secret of his wife. The injured husband keeps the secret for the sake of his daughter—he does not even let his wife learn that he knows it; but from that time forward he treats her son Paul with repellent coldness, and avoids him. When the play opens, Paul has just returned from Africa with the Legion of Honour, and is surprised at the indifference which his supposed father shows to him. At the same time Georges de Maubreuil, now a Colonel, has also come to Paris, after twenty years of foreign service, and is living with his kinswoman, the Baroness D'Origny, a friend of the family of De Chennevières. Here he has seen and has fallen in love with Mathilde, the daughter of Elise. Mme. de Chennevières is at first horrorstruck at the prospect of meeting the man who had betrayed her, and fears that he will presume on their former connexion; but at last she consents to go to a ball at which he is to be present at the house of the Baroness, and to go with her children. At this ball the indiscreet tattle of the Viscount de Beauséant, an old friend of Georges', and the only other man who knows the secret of Elise, and who speaks of it within the hearing of Paul, causes a very natural explosion of wrath on the part of the young man, of which he makes the Colonel the object. A duel is about to be the result, when M. Maurice de Chennevières, who has now learnt the name of his wife's lover, prevents it after a violent explanation with her. He tells Maubreuil that Paul is his son; the Colonel refuses to fight, and apologises. He then turns on Maurice, who has been concealed during the interview with Paul, and they engage with sabres as the curtain falls on the fourth act. In the fifth we find Paul, whose suspicions have been aroused, endeavouring vainly to obtain from his mother an explanation. While they are talking Maurice returns, tells them that Georges is dead, and, his

own revenge being now taken, embraces Paul with effusion, and the secret of Elise remains untold.

In the main, Mr. Barrymore has followed the French plot. He has very properly not changed the scene of the story, which passes in France. The change of names which he has made can only be accounted for by a wish to spare the actors as much as possible from blunders in pronunciation. The five acts of the original have been reduced to four, by almost wholly suppressing the part of the daughter, and the play is wound up in a slightly different way. The duel is placed at the end, and while it is going on behind the scenes Mme. de Latour—the Elise de Chennevières of the original—comes on the scene. She listens in agony to the clash of the swords, believing that the death of her husband is certain, until his appearance shows that it is the false lover who has fallen. This is perhaps, as a mere matter of stage effect, an improvement on the original, but of some of the other changes it is scarcely possible to say so much. The attempt of Paul to get an explanation of the mystery of which he is dimly conscious, which the French authors very properly place after his attempted duel with the Colonel, is put by Mr. Barrymore before the bull. This we cannot help considering a mistake. When the Colonel, whom he knows to be a brave man, refuses to fight him, it is natural that the young man should begin to suspect there was some truth in the scandalous talk of Beauséant and to guess at his own relationship to Maubreuil. To make the suspicions arise before the quarrel is to make the conduct of Paul, here called Maurice de Latour, almost inexplicable. Another dramatic mistake of the adapter's is doubtless due to the necessity under which he lay of covering sin with a mantle of decency. A false marriage with Georges has been invented to excuse Mme. de Latour. By doing this Mr. Barrymore has gone near to destroy the whole sense of the piece. Elise de Chennevières is naturally overwhelmed by the discovery of her sin, but Mme. de Latour is completely innocent. If such subjects are to be taken at all—which we are far from recommending—they should be taken with their artistic thoroughness, and it shows a certain contempt for the audience to suppose that they will be satisfied by such well-worn expedients. Would not Mme. de Latour have spoken of the secret marriage, if there had been one, in the great scene of explanation with her husband? In spite, however, of these changes for the worse, the piece is a powerful and affecting one. Whether it will prove successful is another question. It is very gloomy, and the English public is not fond of gloom. It is also very French in sentiment and situation, and even after a long course of adaptations we have not learnt to be always moved by what moves our neighbours. We are afraid that Mr. Barrymore will find he has made too severe a call on the knowledge and imagination of his audience.

The piece was put on the stage with something like luxury in the fittings, and was acted fairly on the whole and admirably in parts. Mr. Arthur Dacre, who played Maurice de Latour, has not yet rid himself of certain tricks of manner which seriously interfere with the real power he has for expressing emotion. Miss Addison gave a very graceful and gay rendering of the part of the Countess D'Avanches. The minor part of Gustave Regnier was played by Mr. Cooper so as to spoil what might have been a pretty scene. We would venture to point out to him that a gentleman whom love makes timid does not necessarily hop awkwardly round a room like a shy and ill-bred schoolboy. The two chief parts, those of Mme. and M. de Latour, were both excellently played by Miss Moodie and Mr. Clayton. Miss Moodie acted with force and passion, and in the last scene was almost terrible for a moment. The stern, fierce self-control of Mr. Clayton, who looked throughout like a man weighed down by a terrible secret, was equally good. But by far the best piece of acting in the play is Mr. Cecil's rendering of the part of Baron Verduret, the thoughtless babbler who causes all the trouble. Nothing could be more finished than his utterance of the Baron's scatterbrained chatter and scandal, or the way in which he cowered down like a beaten dog when he finds what mischief he has made.

## REVIEWS.

### THE PHYSIOLOGY OF LANGUAGE.\*

IT is interesting to find the French school of philology for the first time entering prominently into the special province which the writings of our own scholars Ellis and Sweet, and the labours of Sievers in Germany, have hitherto almost monopolized; and it is satisfactory to be able to foresee that the new contribution to so important a branch of science will probably attain a place among the leading authorities on comparative philology. It is possible that a better representative of the French school might be found than M. de La Caille, who, as a Spanish exile and a Genevese Professor, belongs to it merely by association and mental characteristics; but it would be difficult to select a scholar who would approach his subject with a keener interest or devote to it a more industrious energy. As a disciple of Schleicher, M. de

La Caille may be granted a sufficient knowledge of the principles of comparative philology; but he does not appear to possess any very extensive or accurate linguistic attainments. His statements dealing with Chinese are often quite erroneous, and his Arabic is very halting. He does not, however, pose in the character of a discoverer so much as in that of an expositor; and, in the present instalment of his work, linguistic knowledge is not so much in demand as sound scientific observation and a thorough acquaintance with certain departments of physiology and zoology. What he has done is to gather together and arrange methodically most of the important results of recent—and especially English—research, and since he usually gives the quotations (which make up three-fourths of his work) in the words of his authorities, translated into French but not otherwise changed, and as he enriches his pages with innumerable references, his epitome of the present state of knowledge will be found very valuable; it would have been more so if the quotations had been less frequently at secondhand. There can be no doubt that if the other two divisions, on the morphology and the philosophy of language, are executed on the same scale and in the same manner as the present part, M. de La Caille's *Glossologie*, apart from theories, will be one of the most important works on the subject yet published. It has grave defects, which we shall indicate, in method, and from the literary point of view it is open to severe criticism; but, if it is completed as it has been begun, it must, as a whole, be reckoned among the leading linguistic treatises of the time.

The present division of the work deals solely with the Physiology of Language, and the subject is arranged in sixteen chapters, of which the first and the last are mainly reviews of the linguistic theories previously advanced in sundry times and by diverse scholars, among whom Professor Max Müller receives at least his due share of criticism. In the first chapter the author takes occasion to vindicate his use of the term "glossology" in preference to "linguistique" and "comparative philology," on which it is only necessary to remark that the term, already introduced by Sir John Stoddart, needs no vindication, and ought to be universally adopted. Chapter ii. shows the importance of linguistic science for the natural history of man,

because it serves better than any other characteristic sign for a rational classification of the various human races; because the history of the development of language may be regarded as the history of the development of man; because this science is destined, I will not say to resolve the problem of origin—that is settled—but to demonstrate in its own department the hypothesis advanced by modern natural science; and because, as the inner manifestation of our higher organic functions, language must necessarily reveal to us the progress of our intellectual activity and explain to us the chief phenomena of our historical development.—P. 29.

The third to the eighth chapters are physiological, and treat of articulation, sound, the anatomy of the vocal organs, and the formation of speech. In all these there is little that is new, and the chapter on sound might have been omitted without injuring the work. The most interesting part is reached at Chapter ix., where a large collection of facts and observations relative to the sounds of animals, and especially the simious species, is gathered from Mr. Darwin, Mr. F. B. Tylor, and other authorities; and the author's theory becomes more explicit. In the two following chapters the speech of mankind is illustrated by a series of observations made by M. de La Caille on the first efforts at articulation essayed by his three children, and this is the only really original part of the work. "Evolution in Language," "The Life of Language," are the headings of the twelfth and thirteenth chapters; and a general *résumé*, an essay on the stratification of language, reproduced from F. Müller and Hovelacque, and a *chronologie linguistique*, bring the first part, "La Physiologie du Langage," to a close.

It must have been by accident that M. de La Caille printed the following remark:—"It is as useless to speculate upon the origin of language as to speculate upon the origin of mankind"; because the first thing that any reader will observe is that the book is full of speculations, and what is worse, positive assertions, on these very subjects. M. de La Caille belongs to the modern naturalist school of France, which has adopted Mr. Darwin's theories with more zeal than discretion, and which aims at applying them to every possible department of science. The danger of this lies in the application of the principle of evolution to matters about which we have not sufficient information. On many subjects the progress of discovery of late years has been so rapid that it is impossible to foresee what its future course may be or what revolutions of theory fresh information may produce. This is peculiarly the case with the study of language, in which every stage of advance has been regarded as the final truth, only to be presently demolished by the discovery of new materials. Schleicher and his numerous disciples are at present the last of the prophets; but it is possible that even they may in time be superseded. There is an air of peculiar fitness and completeness about the usually received theory of primary roots, the original phonetic types of language, which has been deduced from the minute analysis of the Indo-European vocabulary; but it must be remembered that in science, philological or other, though all things advance towards completeness, that completeness has never yet been attained; and that repeated failures have warned us to be cautious in announcing *eureka*. There are already many scholars who do not accept the theory of the recognition of primitive roots; at all events, as forming an actually or possibly spoken language; and the progress of discovery tends more and more to throw doubt on an hypothesis which, in spite of its apparent perfection, is not sufficiently elastic

\* *La Glossologie: essai sur la science expérimentale du Langage*. Par Antonio de La Caille, Privat-docent à l'Université de Genève, Membre de l'Institut National Génois. Avec une préface de M. Abel Hovelacque, Professeur de Linguistique à l'Institut Anthropologique de Paris. Première partie: La Physiologie du Langage. Paris: Maisonneuve et Cie. 1881.

to make room for the results of recent research. At the present moment a new force has been brought to bear upon existing linguistic theories; the young science of phonetics has already made several disastrous breaches in the ramparts of comparative philology, and has completely disposed of a great part of the so-called monosyllabic roots by showing them to be really of two syllables. But the growth of our scientific knowledge of the extreme East is doing perhaps more even than phonetics to shatter the favourite hypothesis of German glossologists and their extensive French following. Ethnology is now pointing unmistakably to the necessity of enlarging the Indo-European domain. We know now that the Aryan migrations were not confined to India and the westward stream, and that, besides tribes which remained in the original homeland, there are others in the extreme East which belong to the same white race, though probably they parted from it at an earlier stage than the Indian and Western emigrants. It is not long since M. G. Janneau sounded the alarm in the scarce book wherein he claimed an Aryan origin for the Cambodian language. Other discoveries since his time have proceeded in the same direction, and the old Indo-European system has really become untenable in many important respects. Many of the so-called monosyllabic roots are found to be decayed forms of longer words, which may be traced outside the ordinary bounds of the Indo-European group.

The uncertainty of the ground upon which linguistic theories are built renders it a matter of regret that M. de La Calle should have adopted so positive and assured a tone in speaking of the origin and the development of speech. The data upon which such theories as he propounds must rest are beyond our horizon; and it is idle to waste time and space upon theories which postulate the possession of the famous telescope which looks round the corner. To gather together all possible facts bearing upon the origin and growth of language is a worthy task; but it is unfortunate that it has not been performed without the introduction of much debatable matter. The attitude of the student of language should be one of cautious reserve; he must wait for the information which is wanting, not build his card-house on running water. M. de La Calle belongs to a school which does not understand reserve, and which has made up its mind upon everything. We cannot hope for any great gains to science from men who in spite of learning and ability are deficient in those prime conditions of true scientific research—diffidence and patience.

The two leading points upon which M. de La Calle lays most stress are these—first, he maintains that the difference between human speech and the sounds of animals is simply one of degree, not of kind, language being merely an evolution from animal sounds; and, secondly, he derives his views on language from the early efforts of children to speak, maintaining that “the formative processes of infantile speech in its early stage of intellectual development are identical, or, at least, very similar, to those which the people who speak the most rudimentary languages employ.” From the consideration of these rudimentary languages in conjunction with the speech of our children, “we may infer the general laws of development and establish the chief lines of evolution.” Such theories require to be supported by very strong evidence. But what is the evidence on which M. de La Calle relies? As a matter of fact our knowledge of the “rudimentary languages” is very imperfect, and much of it is based upon the observations of missionaries who were not properly qualified for the task of recording nice linguistic peculiarities. Again, the observations of the sounds of animals are as yet very incomplete, and it is hazardous to base any dogmatic opinion upon them. It is all very well to state that “the speech of man is nothing but the improvement of special aptitudes of the simious species,” but how much do we know of the special aptitudes of apes? M. de La Calle is much too ready to jump to conclusions on matters of which the wisest dares not risk an opinion, and not unfrequently his conclusions are opposed to the consensus of the learned, as, for example, when he assumes the appearance of man upon the earth in the tertiary period. Too often his views are founded on imperfect knowledge; whilst he refers to numerous obscure African and American dialects, he is strangely oblivious of the important data to be obtained from the East Asian languages; and whilst he quotes many indifferent writers in French, he is apparently unacquainted with the works of Sievers, Ellis, Sweet, and Buschmann. He states dogmatically that large brains are the necessary conditions of intelligence, and takes no notice of the contradiction afforded by the case of the elephant. He discusses the digital origin of numbers, but forgets to mention that the features of the face have served the same purpose. The comparison (p. 227) of the early guttural sounds of childhood with the Hottentot *clik* (not *clak*, as is erroneously stated) is wholly a mistake, and it is a little amusing to find M. Abel Hovelacque quoted as an authority on this subject. The curious blunder on p. 367 by which the Khasia population of 200,000 is converted into a region “deux cent milles” from the Bay of Bengal, reminds us of Pauthier’s confusion of bark and barque in translating the 107th key in *La Chine Nouvelle*. As a matter of fact the Khasia population is not 200,000, but 92,000. Many mistakes of an equally serious kind serve to show that M. de La Calle has not given sufficient study to his subject. The most remarkable omission, however, is with regard to accent. M. de La Calle does not appear to have duly appreciated the importance of accent in the history of language, for he scarcely alludes to it. A little compression of the less essential portions of his work

might well have been made in order to find room for so vital an element in glossology. But, perhaps, the omission may be explained by the fact that a consideration of the nature of accent is not likely to favour M. de La Calle’s theories of language.

The value of the new work on glossology, we must repeat, lies in its quotations, not in its original statements or theories. M. de La Calle may be right in many of his views, but he has not at present the necessary materials upon which to base such views—at the best they are guesses which may prove to be correct. Nevertheless, there is much that is suggestive, and a great deal that will be found very useful, in his book, and certainly there is no work in French that can compare with it. But it is difficult to excuse the objectionable habit of using long words where short ones would serve, and of coining obscure neologisms where there are already suitable words in the language. M. de La Calle loves to wrap his meaning in a cloud of scientific terms till it is scarcely visible; and he delights in inventing such expressions as *diversifications évolutives*, *évolution ontogénique et phylogénique*, *phonème*, *somatisme*, *harmonisation sonnantique*, and the like, which, to any one accustomed to classical French style, are intolerable; and such peculiarities of orthography as *hipothétique*, *cicle*, &c., seem to possess a special attraction for him. What is lacking in style is perhaps atoned for by the abundance of matter; but these literary faults throw some obstacles in the way of appreciating the real merits of the work.

#### LIFE IN WESTERN INDIA.\*

SOMEWHAT more than four years ago (April 14th, 1877) we reviewed a book in which Mrs. Guthrie had described her experiences of life in Belgaum, a favourite district of the Bombay Presidency, under the title of *My Year in an Indian Fort*. The success of that venture, and, we surmise, the encouragement of friends, have emboldened the author to give us two volumes about life above the Western Ghats. Travels in Bengal, the Upper Provinces, and the Himalayas so far outnumber works on Bombay and Madras that we are not indisposed to welcome publications which transport us to scenes identified with the exploits of Sevaji, the founder of the Marhatta power, and the splendour of Mohammedan sovereigns in the Deccan. Mrs. Guthrie has a pleasant way of looking at Indian exile; she never grumbles at the heat, the insects, or the waywardness of native servants; she can describe familiar and domestic objects with a light and graceful touch; and she managed to reach some places not often visited, where the air of novelty has not yet worn off. Few ladies acquire the power of speaking Marathi, and Mrs. Guthrie confesses her ignorance of that dialect, which predominates in the Bombay Presidency. Nor is this want compensated for by any remarkable proficiency in Hindustani or Urdu. The Deccani varieties of this polished language are well known, and would excite scorn and ridicule at Lucknow or Delhi. But Mrs. Guthrie might surely have submitted her chapters to the revision of one or more of the friends and relatives who accompanied her in her explorations. *Boag*, a tiger, for *bhag*, *Kurnes* for *Kurus*, *Judertha* for *Judhisthir*, *Tamasia* for *tamasha*, *Hanumat* for *Hanuman*, *Ficus* for *Ficus*, *nimbar* for *minbar* the Mussalman pulpit, and many other slips, might easily have been avoided without waiting for the critic’s knife. They are not grave errors, but, like the rent in Mr. Pyppe’s camel coat, they vex and annoy. Occasionally we suspect a slight misapprehension of the force of the term employed. A Hindu Raja is said to have founded certain Brahminical colleges in the town of Beejapore. His name is given as Bigam Rai, and the foundation as Bigam Halli. We suspect that the correct Hindu name is Bikram, and that by *Halli* is meant *Havli*, a suburb or part of a town. Dacoits, we are positive, are in most parts of India, and we believe in Bombay, not “tribes” at all, but gangs of ruffians made up of various tribes and castes. The Ramosis are correctly designated as a particular caste or hill tribe of thieves whom prudent Englishmen have long converted into night-watchmen. On one or two occasions Mrs. Guthrie allows her imagination a very wide range. In the Fort of Pratabguri she heard a chant proceeding from the house of a Brahman, whereupon she came to a rapid conclusion that the singers were giving out “that most affecting Vedic hymn to *Uhas*, the dawn.” We need hardly say that a modern Brahman’s ritual is not borrowed from the Vedas, and that it would require the strongest evidence to convince us that the daily prayers of a Konkani priest were based on those ancient documents. Mrs. Guthrie is rather fond of turning to more erudite works on India, such as those of Mrs. Manning for the Hindu religion, Mr. Fergusson for architecture, Grant-Duff for the history of the Marhattas, and the Life of the late Dr. Wilson and the narrative of Ferishta. A very little research would have enabled her to record the son of Arjuna, one of the five Pandus renowned for his archery, as Abhimanya, and not *Albimanque*. We charitably suppose that the name of the great Portuguese conqueror may have been running in her head when she was writing and thinking of the Mahabharat. *Albimanque* is, however, neither Sanskrit nor Portuguese.

It is a more pleasant duty to turn to Mrs. Guthrie’s descriptions of scenery, native costumes, and botanical life. She has an eye

\* *Life in Western India*. By Mrs. Guthrie. Author of “Through Ruaria,” “My Year in an Indian Fort,” &c. 2 vols. London: Hurn & Blackett. 1882.

for all that is picturesque and grand or soft and attractive in Oriental landscapes. Whether it is a big banyan tree, a forest in itself covering an area of more than three acres; or ferns, fuchsias, Dhaturas, wild tobacco, and hedges of roses; or a gorgeous sunset followed by a night so luminous that small print could be read with the naked eye; or a frowning precipice surmounted by a fort impregnable to all but British valour; or the black cotton soil and the treeless plains of the Deccan; or the squalor and degradation of Goa; or the exquisite finish of palaces and tombs raised by Mohammedan generals who had made themselves independent of Delhi: her observation is always intelligent, her description vivid, and her style elegant and clear. Driven away from Mahabaleshwar by the tremendous rainfall against which houses have actually to be protected by an additional roofing of teak leaves, long grass, and bamboos and canes, the author makes some pleasant excursions down the coast and into the interior, and occasionally her sex gave her admission to phases of native society barred against the Collector or Commissioner. She could be present at the house of mourning, and she attended a marriage feast in which the guests were all women, or, if she was not actually present on the occasion, she describes the scene excellently at second-hand. She witnessed a native play which was taken from the scenes in the Mahabharat, and another of more modern cast, in which Rajput princes and Mohammedan ambassadors are brought on the stage; and we gather that, in Dr. Johnson's language, the Whig dogs—that is, the Sultan or Shah and his followers—were not allowed to have the best of it. Native schools where the punishments would amaze a Board representative from Marylebone or Hackney; the house of a native Jain merchant, with its incongruous English pictures and coloured glass ornaments; a wrestling match; and the hospital for sick animals at Bombay are all well described. But the most interesting chapters in the two volumes treat of the famous falls of the Gairsoppa and the splendid desolation of Beejapore. We will take the former first. This wonderful cataract lies out of the beaten track in the kingdom of Mysore, but at no very great distance from the station of Honore or Honalivar, in the district of Northern Canara. The party of the author went by boat, and then by a conveyance peculiar to the Western Presidency, called a *mancheel*, which is a sort of substitute for a palanquin or a *dhooli*, with a thick roof and open sides. It is admitted to be uncomfortable, for if you sit upright in this vehicle you throw your weight unfairly on the bearers, while if you recline you are lost in bundles and pillows. However, the sight of the falls at the close of a night of discomfort was an adequate reward. In the rainy season the volume of water comes down in one solid mass, and takes a leap of nearly nine hundred feet into a basin of rock. In the dry weather there is still one considerable stream and three others of smaller dimensions, to which Englishmen have assigned the appellations of the Raja, La Dame Blanche, the Rocket, and the Hoarer—all very expressive. Seen from below, the view almost rivals Niagara; while above, a bungalow, of somewhat doubtful solidity, with an unpleasant overhanging gallery, enables sight-seers to look down on the precipices furrowed by the raging torrents and on the white mist that conceals the abyss to which they descend. The magnificence of the spectacle is enhanced by the surroundings. Teak trees of huge bulk form a contrast to the sago-palms, and to cotton or *simul* trees, with their red flowers that enclose a very short staple. There is a thick undergrowth of ferns and flag-leaved plants, out of which spring up pepper vines and arums, the wild mango-tree and an inferior kind of cinnamon. No large native bazaar is at hand to suggest degrading associations, nor is there any English station of which the residents might be tempted to get up midday picnics and moonlight excursions to "view the falls." The prints of the bison and the nilghau were seen on the path just trodden by the visitors, and even an occasional wild elephant may visit the spot. It, happily, will be a long time before these falls become the birthright of the ordinary traveller. Time and methodical arrangements are indispensable for the trip, and the neighbourhood at certain seasons is feverish and unhealthy.

Beejapore is sixty miles from Sholapore, a station, as well as that of Ahmednuggur, now accessible by rail. The splendours of this city have been commemorated by the Mohammedan historian Ferishta, and by Mr. Fergusson, our great authority on Indian temples, palaces, and caves. Meadows Taylor's last work, *A Noble Queen*, transports us to that part of India, and numismatologists are often busy with coins of the reign of Adil Shah. But it is worth the reader's while to hear a lady's account of a ruined capital, visited with the comforts that Anglo-Indian authority and management can command. A wide plain, watered by flowing rivers the affluents of the Kistna, studded with crumbling fortifications, and full of cotton plants with their bursting capsules, are suggestive of ancient predatory warfare as well as of modern wars. We rather share Mrs. Guthrie's scruples about the propriety of converting the tombs and mosques of the "faithful" into a temporary residence for officials and sight-seers. There is no doubt that Sheikh and Moulavis view these transformations with no friendly eyes, and in the instance before us there seems no reason why all the party at Beejapore should not have been accommodated in the tents of which we hear something. However, Englishmen cooked, ate, and slept where crowds of Mohammedans had once worshipped; and the rays of the morning sun flashing on pillars and domes and pointed arches, as seen from the mosque of Adil Shah or the tomb of Ibrahim, must be superior to any one view obtainable at Agra and may well rival the ruins of

Delhi. The fortifications that surround Beejapore are said to be six miles in circumference, which, if we remember right, is about the measure of the outside walls of Futtahpore Sikri. How the roof of one great dome is supported appears to have been a mystery even to Mr. Fergusson, who explains it by the extraordinary skill acquired in the use of concrete by native builders. The patterns of the interior display all the variety and brilliancy of colour familiar to those who have seen the best specimens of Upper India. The white marble, the carved woodwork, the noble walls, lined with stone and filled with pure water, the granite pillars some prostrate on the ground, the hall of justice, the towers of five and of seven stories, and the huge pieces of ordnance, one of them having a muzzle nearly five feet in diameter, form a striking contrast to the desolate plains round the city, and the poor and scanty population which extracts a subsistence from the black soil. The explanation of this startling contrast must be sought for in other causes than some terrible misgovernment on the part either of the East India Company or the Crown. In the first place, little more than a century and a half sufficed to raise all these magnificent structures. In that space of time more of the scorpion than the whip must have been applied, and a deal more must also have been laid on the population than native communities, squeezed as they usually are, are able to bear. Then, during the Mohammedan supremacy, irrigation had been largely provided for by aqueducts which speedily went to ruin. That terrible scabies or disease in the soil, the *Reh* or salt efflorescence, has made its appearance and has cursed large tracts with barrenness. But the most potent cause of the decline and fall of the Beejapore Empire was probably the rise of the Mahrattas after the death of Aurungzebe. No civilization is proof against these raiders. Other races and conquerors have left splendid or worthy memorials behind them. The Hindu Raja had his tanks and his temples; the Mohammedan his mosques, his mausoleums, and even his canals; the Buddhist excavated gigantic rock caves; but the Mahratta rose up to plunder and lay down to slay and eat. He was an excellent horseman, he made long marches, and he built a good many forts; but it would be difficult to say what other worthy legacies of his supremacy deserve remembrance.

Altogether, this record of homely pleasures and not very easy excursions to ancient and modern capitals is instructive as well as amusing. We need hardly warn Mrs. Guthrie against the temptation to "get up" more Indian subjects simply in order to write about them; and we trust that her success may not delude all Anglo-Indian ladies into the belief that it is a comparatively easy task to write two readable volumes because they have witnessed a strange sight or two on the hills and plains of India.

#### MISS BRADDON'S WAVERLEY NOVELS.\*

WE have already dealt with Miss Braddon's abridgments of Scott's novels from one point of view. We shall now, in accordance with our undertaking, consider them from another. We shall examine the way in which she has performed her task. We shall consider what claim she has to that "reverential regard to their peculiar merits and characteristics," to that "ardent admiration for the great master of Modern Fiction," which, if we may trust her or her publishers, so greatly distinguish her. We shall see how far "every one engaged in the education of youth," how far "all lovers of pure literature," how far "the Clerical and Scholastic Professions" generally, should respond to the call which she or her publishers make upon them "to vie with one another in making known this earnest endeavour to bring these Masterpieces of Fiction and of Historical Research within the reach of the humblest capacity and of the most slender means," and "to secure, at the earliest possible moment, the widest circulation of the NEW PENNY EDITION" of Scott's novels. "My father," says Francis Osbaldistone, in *Rob Roy*, "is a man who hates dissimulation in others, never practises it himself, and is peculiarly alert in discovering motives through the colouring of language." A Mr. Osbaldistone of the present day might well ask, supposing that all be true that is asserted by Miss Braddon speaking for her publishers, or by her publishers speaking for her, granting her and them even such zeal for the dissemination of pure literature as converts alone possess, why on the outside cover of each book does it stand printed *The Waverley Novels, Copyright Edition*? It is true that in the next three lines is added, "Abridged and edited by M. E. Braddon." But that comes too late. The trick has been already played. It is not of Miss Braddon's hash of *The Waverley Novels*, but of *The Waverley Novels* themselves, that the impudent claim is apparently put forward that we here have the copyright edition. The authors of the appeal which we have just quoted, whoever they may be, may perhaps find that those engaged in the education of youth, the lovers of pure literature, and the clerical and scholastic professions generally will here stop short, and will refuse to put any trust in the earnest appeal which awaits them on the other side of the cover. Even if they can swallow down the words "copyright edition," yet surely they will pause when they come to such an announcement as the following—*ROB ROY, PRICE ONE PENNY, COMPLETE*. Yet, to quote old Andrew Fairservice, "It's hard,

\* *The Waverley Novels*. Copyright Edition. Abridged and Edited by M. E. Braddon.—*Rob Roy*. Price One Penny complete. London: J. & K. Maxwell.

very hard, that a man cannot be believed when he speaks Heaven's truth, just because he's whiles overcome, and tells less a little when there is necessary occasion."

We have thought that we could form a better judgment of Miss Braddon's "reverential regard to the peculiar merits and characteristics of Scott's novels" were we to confine our attention to one of her hashes, or essences, or abridgments, or penny editions, or whatever she may call them. We have chosen *Rob Roy*. It took Scott the better part of one year to write this fine story. By Miss Braddon it has been cut down in about a fortnight. She, we imagine, would have spoken to Scott about his novel in much the same way as Mr. Osbaldistone spoke to his son about the letter in which the young man declined to follow commerce:—"There is much more," my father said, 'to the same effect, occupying four good pages of paper, which a little attention to perspicuity and distinctness of expression might have comprised within as many lines.' Now, if the story of *Rob Roy* were all that had to be told, we at once admit that in the thirty-two pages which Miss Braddon allows herself, it might have been done. But she is not content with telling the story; she alters it. She not only abridges Scott—she improves him. She recasts the plot, she suppresses whole characters, she corrects his Scotch, and she adds touches to his humour. To describe what she does there is need of a new word, and a new word must therefore be coined. She "Braddonizes" him. The great writer of whom we are all so proud, on whichever side of the Tweed we were born—on whichever side of the Atlantic we ought rather to say—who in our youth has cheated us of our hours of play, and who, as life advances, has many a time given us a blessed, if but a short, freedom from pain and troubles, has been turned into a vulgar ranter, who would deserve to be bisected off the boards of a booth in a country fair. As he is shown to us in this penny edition, he would disgrace even a penny theatre. It is, indeed, hard to avoid the belief that Miss Braddon has hashed a hash, and that she has gone not to *Rob Roy* the novel, but to *Rob Roy* in its dramatized form. There are more passages than one, as we shall presently show, which seem arranged with a view to the gods of the gallery. We scarcely know which excite our contempt more—her suppressions or her additions. At times we are more astonished at the folly which leads her to give but one line to Sir Iliedbrand and all his elder sons, to reduce Andrew Fairservice to utter insignificance, to assign to Diana Vernon a part as petty as it is ridiculous, to pass over altogether the wretched creature Morris and his awful end in the waters of the lake, and to give just three lines to *Rob Roy's* escape at the ford. But before long our wonder is transferred to the barefaced impudence which leads a writer to try to add force to the great Sir Walter's plot and vivacity to his incidents, to improve on his humour and to correct his Scotch. That she makes the greatest blunders in the story is only what might be expected. She represents Sir Iliedbrand and his sons as being arrested on suspicion of treasonable practices in the first chapter, before Frank has left Osbaldistone Hall for Glasgow. Her story opens with a ridiculous scene which for its folly would be a disgrace even to one of Miss Braddon's own novels. Owen, one of the best of the minor characters of *Rob Roy*, is made to meet a stranger at an inn. "'O my poor bones,' groaned he, 'the firm of my constitution has been worse shaken than the great house of Osbaldistone & Co.'" He at once informs "the unknown" of the object of his journey to Glasgow, and gives him an account of his master's son and nephew. "'Fare ye weel, Mr. Owen,' replied the Scot, rising to depart. 'I must go to the Hall,' he said to himself, as he went out; 'Sir Frederick may want me. Rashleigh in the North! then the heather will soon be on fire.'" As he goes out, Frank comes in. Owen tells him the news, and bids him "repair to Glasgow, and assist my poor endeavours." Frank at once replies, "'It shall, it must be so; this very hour I'll bid adieu to the bewitching Diana Vernon, and seek this destroyer, this Rashleigh! Set forward, Owen, instantly. . . . O Diana! must we, then, part?' 'Diana!' exclaimed Owen. 'Ah love, love!'"

In the second chapter Sir Frederick Vernon is introduced, with his daughter Diana, "a girl of powerful intellect and many charms, but of a dauntless and somewhat masculine character." He warns her against her cousin Frank's penetration. "'Rely on my discretion, sir,' replied Diana submissively." He next bids her remember that she is either devoted to a cloister or the betrothed bride of Rashleigh. "'The bride of Rashleigh! never, never!' she exclaimed when she found herself alone; 'any lot rather than that—the convent, the jail, the grave! I must act as becomes the descendant of a noble ancestry.'" She thereupon sends for Frank and takes leave of him. Their parting is thus described by Scott. "'Adieu, Frank; we may never meet more—but sometimes think on your friend Die Vernon.' She extended her hand, but I clasped her to my bosom. She sighed as she extricated herself from the embrace which she permitted, escaped to the door which led to her own apartment, and I saw her no more." The following is Miss Braddon's abridgment:—"O Frank! we are now to part, perhaps never to meet more. In the world, away from me, you may find a being less influenced by evil fortunes and evil times." "Never, never," cried Francis, as he clasped her hand, and would fain have drawn her to his breast, 'the world can afford me nothing to repay the loss of her I must leave behind me.'" We notice, by the way, in the puff of these pennyworths of mince-meat that it is hoped that, "whatever objection may have been felt hitherto by the Cleric and the Layman to placing fiction before children of tender years, the New Penny Edition will be found to

satisfy every scruple, and to realize every requirement." Can it be the case that maidenly modesty has taken offence, or, at all events, thinks that the Cleric and the Layman might take offence, at "clasped her to my bosom," and has therefore substituted "would fain have drawn her to his breast"? Is Saul also among the prophets? And yet, strange to say, we find put into the mouth of Bailie Nicol Jarvie, when he is speaking of his kinswoman Helen Macgregor, an indelicate expression which we certainly cannot discover in our copy of Scott.

But to pass on with the story, Frank receives from Miss Vernon the packet which he is not to open till ten days before the bills are due. So far Miss Braddon keeps to the original. But she makes Frank reach Glasgow—a good hundred miles from Osbaldistone Hall—within twenty-four hours after taking leave of Diana. Even before he gets his supper he enters the Tolbooth. There he is reminded that the time had elapsed, and he instinctively draws out the packet. She has read *Rob Roy* so carelessly that she does not notice that Frank's ride took some days, as indeed it must have done, considering the distance he traversed, the roughness of the ways, and "the broken-winded and spavined pony" on which his guide rode. Not only is the time cut down, but the fine scene in the Glasgow church is altogether left out. The meeting with *Rob Roy* on the bridge is thus managed. Frank says to Fairservice, "See the horses taken care of and order something for my supper; while it's preparing, I shall walk here upon the bridge." In the prison scene it is that we first notice the improvements in Scott's humour and language. It is not easy to show the changes that have been made, for a scrap has been taken from here and a scrap from there; they have been next adorned, and then tacked together. According to Scott, *Rob Roy* at the gaol-door said, "'Dougla! man! hae ye forgotten Ha nun Gregarach?' 'Deil a bit, deil a bit,' was the ready and lively response. . . . 'It's lang since she's seen ye.'" In the penny hash it thus runs:—"Dougla, you have not forgotten me?" said the unknown, extending his hand graciously to the turnkey, "Och, te'il a pit! to'il a pit!" cried the turnkey, . . . 'it's lang sin' she wadna sae't ye.'" According to Scott, Dougla takes Frank up to Owen's dungeon, and leading him in says, "'She's sleeping.' 'She! who? Can it be Diana Vernon in this abode of misery?' In the penny hash, as soon as Dougla said "It's lang sin' she wadna sae't ye," it thus follows:—"She! she seen him," thought Francis, . . . 'It is, then, a female to whom I am conducted, or is it merely the dialect of his country in which that animal expresses himself?' One of the changes made is absurd enough. "'How's this? how's this?' said Nicol Jarvie—'strangers in the jail after lock-up hours.'" Miss Braddon thus improves on the passage—"Hoo's this? Strangers in the Tolbooth after lock, up hours!" When we consider all the changes that are made in the Glasgow dialect, we can scarcely believe that she is such a mistress of it as, with all her audacity, to have ventured on the changes herself. Johnson, we remember, said that Bolingbroke had hired a beggarly Scotchman for half-a-crown to publish his Philosophy. No Scotchman, we feel sure, but a beggarly one—one, that is, who was reduced to the condition of a beggar—could be got to meddle with Sir Walter's Scotch. Such men, unhappily, are to be found among the hack writers in all nations, and the services of such a man may have been in the present case secured.

In the third chapter we make the acquaintance of Rashleigh. Tom Davies—the Tom Davies who had a pretty wife—somewhere or other describes an author or an actor as one "who lent a distinguished glare to tyrannic rage." Such a glare does Miss Braddon lend to Rashleigh. He comes before the footlights with a dependent, to whom he says that Frank "is a basilisk in my sight, and has been an insurmountable barrier to my dearest hopes." Then, with a warning frown, he orders the man not to breathe a syllable to any human being of the business which the Government has entrusted to his direction, and bids him depart. Having the stage all to himself, he indulges in a soliloquy:—"Cursed infatuation! Yet I repine not. Rejected by her I loved, scorned by him I would have served, they shall at least find the false friend and the renegade knows how to resent those insults." We pass on to the scene at the Clachan of Aberfoil. A certain humorous turn is given to the English captain, who is made to say sarcastically, "Mr. Bailie Jarvie" (the italics are part of the hash, and not ours). Dignity, moreover, is added to the scene. The corporal who was bidden to hang Dougla receives from Miss Braddon promotion to the rank of sergeant. "Now, Muse, let's sing of mice," at first wrote the author of the "Sugar Cane." "Mice," we are told, was afterwards altered to *rats*, as more dignified. After the captain and his men had marched off, "Rob Roy and Rashleigh emerged from their ambush at the back of the hut." Surely no one but Mr. Vincent Crummies could have imagined such a scene. This ambush and this emerging is not, we undertake to say, of Miss Braddon's devising. It bears all the marks of a hand long practised in turning good novels into ridiculous dramas.

We have neither patience nor time to follow this abridger and editor through all her silliness. We must pass to the last chapter. The curtain falls on the shores of Loch Lomond, with all the chief characters before the footlights. Helen Macgregor makes a speech of three lines; and *Rob Roy* makes one still more brief. Frank muses. "What a wayward fate is mine! My father's peace of mind is happily restored, but mine, with Diana, is lost for ever." At this moment a dark figure emerged from the obscurity for an instant, only to withdraw into it again. Three

lines lower down two figures appeared ascending towards Frank. "Amazement," cried Francis. "Dianna Vernon and——" "Her father," interrupted Dianna. "Do not involve yourself in my fate," said Sir Frederick; "protect my child, but leave me to suffer. I am familiar with danger, and prepared to meet it." "Meet it then here!" exclaimed the low and resonant tones of a voice which was but too familiar to all three; and Rashleigh, springing out of the woodland shadows, stood before them a figure full of menace. He was followed by a band of soldiers. The cry was heard of "Gregarach." "In another moment Rob Roy rushed upon the scene, followed by his Highlanders." Rashleigh is killed in five lines. Sir Frederick, turning to Francis, said, "You, young man, have proved yourself worthy of my child, and to you I give her." A dozen more lines and the curtain falls.

Does Miss Braddon remember what was done with the mighty Effreet who was so vast that his head was in the clouds while his feet rested upon the ground, when once he had been so much abridged that he was got into a vessel of brass. He was given to a Jinn, and by him he was cast into the sea. The spirit at length escaped from its brazen prison, and he indignantly kicked it back into the waves where it and he had so long lain. There it has lain in utter obscurity—a memorable lesson to all abridgers.

#### EIGHTEEN CENTURIES OF THE CHURCH OF ENGLAND.\*

IT would in any case be an ambitious and somewhat perilous enterprise to compress into one volume a history of the Church of England from the apostolic age to our own, beginning with St. Paul's alleged visit to Britain—of which we shall have a word to say presently—and ending with a discussion of the assaults of the Liberation Society and the merits of Ritualism. But we have a further objection to Mr. Hore's scheme of presenting English Churchmen with "an unbroken narrative of their Church from its commencement to the present day"—meaning thereby from the first century—for the simple reason that no such unbroken continuity of "their Church" exists. He is anxious to insist that the English Church was not "founded by the State at the Reformation"; and of course it is true—what-ever may be thought of the ecclesiastical changes then introduced, some of which he strongly condemns himself—that the same historical body, with its prelates, clergy, and corporations, which existed when Henry VIII. came to the throne has continued, with the brief episode of the Commonwealth, down to our own day. It is also true that "a Christian Church existed in this country of ours long before the Germans converted Britain into England." But it is not true that the Anglo-Saxon Church founded by St. Augustine, from which the present English Church is lineally descended, is identical with the British Church which it superseded, though both may have been equally orthodox and equally parts of the great Catholic community; that is quite another question. As Bishop Forbes expresses it, "the founder of the existing Church of England is Pope Gregory the Great." If, therefore, Mr. Hore had proved, as he has not, the apostolic origin of the British Church, he would not thereby have proved "its antiquity, and the succession of its bishops, and its identity with our Church of the present day," which traces its descent not from the British but the Anglo-Saxon Church. And, indeed, he virtually admits this, when in his Appendix he gives "the succession of the Archbishops of Canterbury from the Apostles," by first tracing them up to St. Augustine, and then giving a list of Popes from St. Peter to Gregory I., though Augustine was consecrated not by Pope Gregory, but by Virgilius, Bishop of Arles. There is evidently some confusion in his mind on this matter of the British Church, as appears from his making it a great point that "a Roman Catholic writer, not generally very favourable to the Anglican Church, readily admits" that Christianity was probably introduced into England during the Apostolic age. Charles Butler was a highly respectable, but not very critical writer, and we suspect that on this point he was mistaken; but his testimony is neither more nor less valuable from the fact of his being a Roman Catholic, for it matters nothing to the Roman controversy either way when or by whom the British Church was founded. Mr. Hore would have done wisely, we think, to omit his Part I. on the British Church, or at least to confine it to a single prefatory chapter, and he would certainly have done well to be more cautious in his statements about its origin. It may or may not be true that the church of Glastonbury was the oldest Christian church in Britain, or even in the whole world, but it shows an odd idea of the value of evidence to cite among the "abundant proofs" of it the testimony of Fuller and Archbishop Usher, who lived sixteen centuries afterwards. Nor is there a shadow of early authority for the conjecture that St. Paul preached either in Gaul or Britain, though there is some evidence of his having visited Spain. Mr. Hore tells us that "there is good authority in the Fathers for believing that by Galatia, mentioned 2 Tim. iv. 10, Gaul is meant, and that St. Paul came to Gaul," from whence he would easily pass over into Britain. The earliest ostensible authority for this notion is that of Sophronius, in the middle of the seventh century, and even the statement quoted as his is not to be found in his extant writings. Alford dismisses this interpretation of Galatia as purely conjectural. As for the hopelessly corrupt condition of the British Church, and its refusal to take any steps for converting

"the hated Saxons," Mr. Hore cites the testimony not only of Bede but of Gildas, one of these British Christians, and he might therefore have been somewhat less severe on Augustine for the very moderate demands he made upon them to join him in converting the heathen, and to adopt, not the "Roman" custom, as he words it, but the Catholic, in the observance of Easter and the administration of baptism. There were several Roman usages from which the British differed, about which Augustine said nothing, but their difference about the time of Easter did not arise, as our author seems to imagine, from a preference for the Oriental method, but simply from their having, through long isolation from the rest of Europe, lost the right computation which had been fixed three centuries before at the Council of Arles, where British bishops were present, and at the Œcumenical Council of Nice, whose authority they fully acknowledged.

Mr. Hore divides his narrative into seven parts, the first comprising the British, the second the Anglo-Saxon, the third the Anglo-Norman Church, between which and the Reformation Era he rather oddly inserts "Part IV., the Anglo-Roman Church," which is explained by the equally odd statement in the preface that "the course of the Church of Rome for more than three hundred years flowed in much the same channel as that of our own Church." If by the Church of Rome he means the local Roman Church, the statement is unintelligible; if he means, as of course he does, the Western Church in connexion with Rome, the English, like every other national Church in Europe, did not "flow in the same channel with it," but formed a part of it down to the sixteenth century. And, as though he had not already more than enough matter for his very limited space, Mr. Hore has introduced into this "Anglo-Roman" Part a bird's-eye view of the growth of the Papacy for the first fifteen centuries. It is drawn fairly enough from the ordinary anti-papal point of view, but it was obviously impossible to deal to any purpose with so vast a theme in a chapter of thirty pages, and the author had much better have let it alone, as it forms no part of the proper subject of his volume, and there are plenty of excellent works about it easily accessible to his readers. His narrative improves both in accuracy and soundness of judgment as it comes further down, though the inevitable brevity, not to say curtness of treatment, involved in the plan cannot but make it unsatisfactory reading for those who wish to gain a real grasp of any period of the history. We are glad to see that Mr. Hore has escaped the common error, exposed by Dean Hook, of classing the Ultramontane and persecuted Bishop Peacock among "Reformers before the Reformation." His estimate of the character of the leading persons concerned in the events of the Reformation is just, though he has not sufficient room to justify it. We give as a fair specimen of this, and of the general style—which is apt at times to be faulty—the characters of Gardiner and Cranmer:

The character of Gardiner is much misunderstood, and in the minds of many people is associated with that of Bonner in the cruelties of this reign. No mistake could be greater. Gardiner probably was not averse to the burning of a heretic (few people in those days were), least of all Cranmer. Gardiner had manfully withstood the ultra-reforming spirit of the late reign, which Cranmer had so greatly encouraged. He had himself been persecuted; but how did he behave when he was restored to power? His bitterest enemy had been the Duke of Northumberland; yet when the duke was a prisoner in the Tower, he visited him, and pleaded for his life. No one could have opposed him more than did Peter Martyr; yet, when it was proposed that the Reformer should be called upon to answer for his conduct, Gardiner, at that time Lord Chancellor, not only exerted his influence in his favour, but supplied him with the means of departing from the country. Cranmer, a comparatively unknown man, had been appointed over his head to the primacy; through Cranmer he had been committed to prison under Edward VI.; yet to him on one occasion Cranmer owed his liberty, and to the last Gardiner did all in his power to save him.

No one will reproach Cranmer that he had not the gift of fortitude; but not having that gift himself, he will always be blamed for want of feeling, and committing others to a cruel and untimely death. But truth compels one to confess that in no sense is he entitled to the appellation of martyr. A martyr is one that dies *willingly*, rather than renounce his opinions. Cranmer both renounced his opinions, and died *unwillingly*: he renounced his opinions more than once, and although it is unjust to reflect upon him that he might have done the same again to save his life, it is nothing to say he recanted his recantation when his life was forfeited. He only did what others do when they are at the point of death, and all hope of pardon in this life is excluded.

There seems to be no proof that the Second Prayer-book of Edward VI. either received the sanction of Convocation or ever came into general use; only three editions were printed, and these so badly that further publication was stopped by an order of Council September 27, 1552. Neither is it clear that the forty-two Articles received any sanction of Convocation; they were only circulated by Order of Council two months before the King's death. If the following account of the state of things in the early part of Elizabeth's reign is substantially correct, as we believe it is, it seems only natural to suppose that the famous "Advertisements," of which we have heard so much of late, were intended, as the author says, rather to prescribe the minimum than the maximum of allowable ritual; he adds that they had only episcopal authority, and there is no evidence to show that the Queen even saw them:—

In 1564 Cecil complained to the queen of the incongruous manner in which the services of the Church were celebrated. Some said the service in the chancel, some in the body of the church, some in a seat made in the church, some in the pulpit facing the people, some in surplices, some without: In some churches the holy table was in the body of the chancel, in some in the middle of the church, in some altar-wise near the wall, some—

\* *Eighteen Centuries of the Church of England.* By the Rev. A. H. Hore, M.A. Parker & Co. 1881.

times with a carpet on it, and sometimes without any covering. Some celebrated the Holy Communion in surplice and cope, some with only surplice, some with neither; some with a chalice, others with a common cup; some with leavened, others with common bread; some received kneeling, others standing or sitting; some baptized in a font, making the sign of the cross; some in a basin without the sign; some celebrated baptism in a surplice, others without; some went about in a square cap, others a round; some in scholar's clothes, and some without.

It is "a far cry" from Queen Elizabeth's reign to the middle of the eighteenth century, but external religion, in spite of the Laudian revival, had then sunk to so low an ebb that Bishop Butler was actually charged with Popery, and even reported to have joined the Church of Rome, because he put up a cross in his private chapel, while "in 1777 Archbishop Cornwallis, of Canterbury, was met with 'No Popery' cries, because, aided by Bishop Porteus—then of Ochester, and afterwards of London—he had advocated an observance of Good Friday, which at that time had become obsolete." It was openly said that his "arrogance" in causing the shops to be shut on that day would soon be followed by "the elevation of the Host and Crucifix to prostrate crowds in dirty streets." And unfortunately this laxity in outward observance had not been compensated by any increased energy in the spiritual action of the Church, but the reverse. Accordingly, by the end of the eighteenth century what religious life survived in the nation was rapidly drifting in the direction of Dissent:—

At the beginning of the present century, dissent had been increasing with rapid strides. Sherlock states that at the end of the seventeenth century dissenters were only in proportion of one to twenty, at the death of George I. they were one to twenty-five, Churchmen. In 1736 there were only six meeting-houses in North Wales, and thirty-five in the whole principality, whilst there were 850 churches. Then came the movements under Wesley and Whitfield, which, drifting away gradually from the Church, reanimated the languishing Nonconformity of the country, in which they were powerfully aided by the influence of Lady Huntingdon, whose numerous chaplains seceded and formed Independent and Baptist congregations. Cleaver, Bishop of Chester, in his charge of 1790, complains of those "who sought the Orders of our Church with a view to set at defiance her ordinances, to depreciate her Ministry, and to seduce her members into their unhallowed conventicles, under the arrogant and false pretensions of being themselves exclusively Gospel preachers."

The Evangelical movement greatly increased the number of dissenters: Evangelical clergy frequently either became dissenters themselves, or more frequently led their hearers to become so: no fewer than thirteen young men, converted by Venn, entered the ministry, chiefly as Independents; Rowland Hill had his meeting-house in London, and only after great difficulty, and being refused by six bishops, obtained deacon's orders; whilst John Newton, at Olney, with a parish of 2,500, succeeded in emptying his church, and filling the parish with dissenters and Antinomians. Through such means, when, by reason of the rapid growth of our manufacturing, dense populations were swarming from villages into towns, and had neither churches to attend, nor clergy to look after them; when the Church had fallen asleep, dissent assumed vitality; the meeting-houses in Wales increased from thirty-five to one thousand; so that at the beginning of the present century, Nonconformity had grown from one twenty-fifth to at least one-fourth of the population; when George IV. became king, dissent, and not the Church, was in possession of the large towns; by the time that William IV. succeeded him, dissent had become a power in the State.

In the present day Mr. Hore computes that either Nonconformists of all kinds are in a minority varying from 22 to 28 per cent. or that a large proportion of Protestant Dissenters prefer to be married and buried with the rites of the Established Church. He holds, however, "that there is a gravitation of Dissenters towards the Church," and proceeds to dilate on "the peculiar advantages" of the English Church, not only for conciliating Nonconformists, but promoting the reunion of Christendom generally. Many of our readers probably are familiar with the well-known passage of De Maistre—not *Le Maistre*, as our author calls him—on this subject. But as De Maistre was not only "one of the strictest sect of Ultramontane opinions," but was the recognized leader of the great Ultramontane reaction of the earlier part of this century, which gives additional force to his certainly remarkable testimony, it may be worth while to put his words on record here (we have taken the liberty of correcting the numerous misprints):—

Si jamais les Chrétiens se rapprochent, comme tout les y invite, il semble que la motion doit partir de l'Eglise d'Angleterre. Le Presbytérianisme fut une œuvre Française, et par conséquent une œuvre exagérée. Nous sommes trop éloignés des sectateurs d'un culte trop peu substantiel; il n'y a pas moyen de nous entendre, mais l'Eglise Anglicaine, qui nous touche d'une main, touche de l'autre ceux que nous ne pouvons toucher; et quoique sous un certain point de vue, elle soit en butte aux coups des deux parties, et qu'elle présente le spectacle un peu ridicule d'un révolté qui prêche l'obéissance, cependant elle est très-précieuse sous d'autres aspects, et peut être considérée comme un de ces intermédiaires chimiques, capables de rapprocher des éléments inassociables de leur nature.

It may be well in conclusion to point out a few specimens of the many blunders scattered over the volume, which are not perhaps to be wondered at in a work embracing so wide a period, but which the author would do well to correct if it should reach a second edition. We are told in one place that "King Alfred patronized John Scotus Erigena, the opponent of Transubstantiation," and the following footnote is appended:—

In the time of Erigena, a French monk named Paschasius Radbert first taught the doctrine of Transubstantiation as it is now taught by the Church of Rome. Erigena strongly opposed this novel doctrine; and in consequence Nicholas I. wrote to Charles the Bald, at whose court he resided, to banish him from France; this induced him to come to England.

The statement that Paschasius Radbert—who, as Neander says, merely advocated "that view which had commonly prevailed from the time of Gregory the Great"—first taught Transubstantiation is sufficiently inaccurate, but the assertions about Erigena are worse than inaccurate. That a writer who, according to

Milman, became a pantheist, while others excuse him as halting on the verge of pantheism, was opposed to the ordinary teaching of the Church on the Eucharist, as on many other subjects, is more than probable; but that he wrote a tract in reply to Paschasius Radbert is a later conjecture based, as Lauf has shown in his *Studien und Kritiken*, on a confusion between his works and those of Ratramnus, the leading opponent of Paschasius. It follows of course that the notion of his being banished from France on this ground is a conjecture based on a conjecture, and a perfectly worthless one, while the story of his taking refuge at Alfred's "newly founded University of Oxford" rests on a mere vague rumour, probably based on a confusion of his name with that of John the Saxon. The next mistake we shall notice is less important, but more inexcusably careless. We are told in one page that Archbishop Theobald "admitted Becket to deacon's orders," and that "as a deacon" he had various pieces of preferment given him, ending with the archdeaconry of Canterbury; in the next page we are told that he was "only in minor orders" when appointed to the primacy. The two statements are incompatible, and both are incorrect. Becket was ordained deacon on his appointment to the archdeaconry of Canterbury—therefore of course before he was elected Archbishop—but he had held his various other preferments when only in minor orders. When Mr. Hore tells us that "the cost of Wycliffe's Bible in 1429 was 2*l.* 16*s.* 8*d.*, when money was about the tenth of its present value," we presume he means about ten times its present value. To say that the persecutions and punishments of Roman Catholics under Elizabeth were not political but religious because the victims were "traitors," is only true in the same sense, and hardly to the same extent, as may be said of the punishment of heretics under Mary, for which the author offers no such excuse. The practice of the Roman Catholic religion was made a capital offence under Elizabeth, and many were put to death for this alone who were not disaffected to the Government; on the other hand, many of those executed under Mary were notoriously "traitors." It is equally incorrect to say that Campion the Jesuit openly advocated the cause of Philip, King of Spain, and was executed for this. The precise point which led to Campion's condemnation, as we showed some years ago in reviewing Mr. Simpson's Life of him, was his refusal formally to abjure the deposing power, though there is reason to believe he did not himself hold it, and he always professed himself a loyal subject of the Queen, and certainly did not "advocate the cause of Philip" openly or otherwise. Mr. Hore does not steer clear of mistakes—the stranger because they are so obvious—when he comes down to our own day. Thus he tells us, in connexion with the conversions of 1845, that "on November 1, Mr. Newman and Mr. Oakley were received into the Roman Catholic Church in the chapel of Oscott, by Dr. Wiseman." He might have learnt from the *Apologia*, which is quoted in the very same page, that Mr. Newman was received, not at Oscott but at Littlemore, not on November 1, but October 8, and not by Dr. Wiseman but by Father Dominic. Mr. Oakley's reception closely followed, and that did take place at Oscott. There is an unpleasant pertness about a sentence in the following page as applied to men twice his own age, and of more than twice his own ability:—"Newman set up his own ideal of a Church; so he wandered about from faith to faith [which, moreover, is not true] till he found a home, and let us hope rest, in Rome, as his younger brother did in Rationalism." In reference to the Bonn Conference of 1875 it is rather amusing to learn that the Archbishop of Syria and Tenos "is generally believed to have been chiefly instrumental in the agreement arrived at between the Easterns and Westerns," not meaning—what would have been true enough—those present at the Conference, but the Eastern and Western Churches. For the next sentence begins:—"On August 14, these two branches of the Church arrived at an agreement to the following effect." Considering that Dr. Dollinger, who presided, was careful to explain that those who attended the Conference came in their individual capacity, and not as in any way delegates of their respective Churches—as Dr. Liddon says in his preface to the *Report*, "had no idea of representing any one but themselves"—and that the "agreement" between the Churches is still unfortunately a matter of hope rather than of history, this statement is at least premature. In spite of defects, partly remediable, partly incidental to its method, the volume may prove serviceable as a handbook for reference, though it can never be a substitute for the study of more complete works, such as the excellent *History of the Church of England* by Canon Dixon now in course of publication.

#### BOOKS ABOUT THE HORSE.\*

ENGLISHMEN are proverbially opinionative on the subject of horses, and they are much given to putting their opinions into print. Fortunately, books on horses are generally short, but enough of them have been published to fill a large library. A celebrated author once said that no people read so few books as

\* *The Horse: as he Was, as he Is, and as he Ought to Be.* By James Irvine Aulton, F.R.C.V.S., Author of "The External Anatomy of the Horse," &c. London: Allen & Co. 1881.

*The Horse, and How to Manage Him: an indispensable Guide to Breeding, Rearing, Training, Grooming, Harness, and all other topics connected with the occupants of the Stable.* London: Ward, Lock, & Co.

those who write books. Be this as it may, it is probable that among the rarest readers of books on horses are those who know or care much about horses. Handbooks on horses are objects at which a reviewer—to use a horsey expression—is apt to shy. There are, however, exceptions to this rule, and even a nervous critic may be induced to approach a neat little book on horses containing good paper, excellent print, very fair illustrations, and the widest of margins. It would almost seem as if the ample margin of *The Horse*, by Mr. Lupton, were intended to tempt the reader to put down his own opinions beside those of the author, and it is probable that a large number of amateur critics will give way to this temptation. This little work does not profess to be a compendium of equine knowledge. It is written with one simple object, which is to prove that of late years the English nation has failed to supply the demand for good horses, and to express the opinion of the author that the cause of the insufficiency of the supply is the deterioration of the breed of horses in this country. Some of the premises laid down in the book are undoubtedly true, but the author's manner of reasoning from them appears to us rather illogical. He tells us that "we can produce the best horses in the world," that "our home-bred utility horses are superior to those of the Continent," and that "at the present moment we possess the best breed of horses in the world, whether they be thoroughbreds, nags, or cart-horses"; and yet he complains of the degeneracy of our horses in the following curious sentence:—

Is it not a national disgrace that England of the past, which supplied Europe with her best horses, should now be dependent upon Continental countries for her useful supplies?

He finds fault again with English breeders for in-breeding, and tells us that we have now arrived "at a period similar to that of 1870," "when in and in breeding was impressing its degeneracy upon our equine stock," but that "fortunately a remedy exists, by resorting to a fresh cross of good blood." Yet he grumbles because Englishmen have to purchase horses from abroad, which is the only possible remedy for the evil. The kind of horse which is most wanting in England is, according to the author, "the general utility horse." We have already quoted a passage in which it is admitted that "our home-bred utility horses are superior to those of the Continent." What, therefore, can it be that the writer desires? Moreover, let us inquire what description of beast the general utility horse may be. Is he a horse that will win a steeplechase when required, hunt when called upon so to do, draw a tradesman's van about on week-days, and take his owner's wife down to Richmond on a Sunday? We have certainly not yet succeeded in breeding a horse that will do all these things, and some time is likely to elapse before we can do so; but it seems to us that horses are bred in England suitable to every description of work. Most horse-owners know what sort of an animal is the horse that is advertised as "good in single and double harness, a clever hunter, an excellent brougham horse, a first rate lady's horse, docile with children, accustomed to be driven as leader in a team, &c. &c." It means a brute that is bad or indifferent in every one of these capacities, and we must confess that we should look with grave suspicion upon any animal that was offered to us as a general utility horse. If, by general utility horses, the author means active half-bred horses, we cannot agree with him in thinking that there are fewer of them to be had in this country now than formerly. In support of our opinion we may observe that a few years ago the Government determined to send a number of half-bred sires to India every year in order to improve the native breeds, and that excellent horses of the kind were (and still are) readily found. There was considerable variety of form among them, but the greater bulk might be divided into two classes—one much resembling carriage horses, probably bred by thoroughbred horses from heavy mares, the other consisting of strong, short-legged, high crested cobs, about fifteen hands high, with plenty of bone and fine knee action. Many of these half-bred sires were marvellous trotters; and yet from this book about the horse one would imagine that there are few good trotting sires to be found in England. It is true that in many parts of England there are no good trotting stud horses; but in Norfolk, where this kind of horse is specially cultivated, there are at least enough to keep up the breed, besides supplying a considerable number for exportation.

Mr. Lupton regards the racecourse as the great cause of the supposed deterioration of our horses. To the objections which may be urged against racing we are fully alive; but, although it is likely that certain modifications and alterations in the present system of racing might tend to the improvement of our breed of horses, we are by no means disposed to admit hastily that racing has injuriously affected English horses. Racehorses are bred for a special purpose, and no breeders of other horses are obliged to make use of thoroughbreds unless they please. The fact is that general breeders put their half-bred mares to thoroughbred sires simply because they find that it answers their purpose to do so. It is possible that what Mr. Lupton terms "the excessive creation of thoroughbreds," engendered by the racecourse, may cause a number of bad racehorses to be thrown on the market; but horses which are too slow for racing often make good hacks or hunters, while even the dregs of the racing stable have their uses in hansom-cabs, light errand carts, or riding schools. We believe that there are at least as many good horses of all kinds in England now as there ever were; but it is certain that the number of people wanting good horses in this country has

been more than quadrupled during the last hundred years, and we freely admit that the supply has not increased proportionately with the demand. Nevertheless, there is no great difficulty in procuring a good horse of any stamp or description in Great Britain if a man is prepared to pay for it; but this is an all-important condition of the transaction.

As regards the complaint "that England of the past should now be dependent on Continental countries for her useful supplies" of horses; without pausing to quibble about such trifles as literary inaccuracies, we will suppose a case which would be exactly parallel to our country's "national disgrace" in the matter of horses. The Hospice on the Great St. Bernard has been famous, for about a thousand years, for its breed of dogs, but if all the farmers in Switzerland were to take it into their heads to buy St. Bernard dogs, the Hospice could not possibly supply them. In order to procure them, the Swiss farmers would have to apply to people who have dogs of the breed in France, Germany, and England; but this would not imply that there had been any decline in the kennel at the Hospice. An hour's walk through the West End of London during the season ought to convince any one of the immense number of people who keep at least a pair of carriage horses in these days. Great quantities of these horses are bred in England, but when a jobmaster or dealer wants a good many horses of this kind suddenly, he may not be able to find enough at once in the British market. He has to go to Germany or Canada, and purchase horses from farmers who have our breed in those countries. We have picked out many useful and good-looking carriage horses from lots imported from Canada, and we have found nice hacks and carriage horses in Austria; but if we wanted to purchase a pair of the very best and smartest of carriage horses, or the finest weight-carrying hunters, we should certainly look for them in Great Britain, rather than in any other country. If, on the other hand, we wanted to buy a large number of one special stamp of horse, we should probably get them most quickly by purchasing as many as we could find at hand in this country, and sending agents to make up the number from Canada or Germany. Not only is it sometimes necessary to buy horses abroad, but an idea has been started that it might even pay Englishmen to breed their horses abroad. A large breeding stud of thoroughbreds has very lately been shipped off for New Mexico, where it is believed that the climate, the herbage, and the general conditions of the country are exceptionally favourable for the breeding of horses.

The chief value, in our opinion, of Mr. Lupton's book consists in its historical description of the English horse. The history of our horses had certainly been told too often already, but it had generally been told badly, and here it is told well. The following paragraph may be worth quoting as a specimen of the historical portion of this book:—

Chargers of great size were imported by the Anglo-Normans, Plantagenets, and Tudors, from Flanders and Lombardy, and Chaucer thus sings the praises of this equine type:

For it so high was and so broad and long,  
So well proportioned for to be so strong,  
Right as it were a steed of Lombardy.

Before the great horse the race of ponies gradually receded; the small animals were mated with imported weight-carriers, and thus the standard of height was raised from eleven to fourteen if not fifteen hands, for we find that during the reign of Henry VIII. a law was passed which enacted that no stallion less than fifteen hands and no mare less than thirteen hands should run wild in the country. A colt two years old and under eleven hands and a half high was not permitted to run on any moor, forest, or common where mares were pastured, and at Michaelmas the neighbouring magistrates were ordered to drive all forests and commons and not only to destroy such stallions but also "all unlikely titts, whether mares or foals." It was further ordered that all prelates and nobles, and all those whose wives wore velvet bonnets, should leap and ride upon stallions not less than fifteen hands high, and in Edward VI.'s reign a law was passed prohibiting the importation of stallions below fourteen hands and mares below thirteen hands high.

*The Horse, and How to Manage Him* is one of the shilling handbooks with which railway bookstalls are now flooded. It is described on the title-page as "an indispensable guide to breeding, rearing, training, grooming, harness, and all other topics connected with the occupants of the stable." It is full of pictures; it has an index; it contains prescriptions for all kinds of equine diseases, and it tells how to build a stable. It not only professes to give information about English, European, American, and Indian horses, but also about Chinese, Iceland, Circassian, and Dongola horses. There is a great deal in the book that is very true, but it treats of too many subjects to give sufficient information on any of them. Some of the illustrations are very bad. The picture of the "English hunter" represents a camel-like brute that would not be worth twenty pounds. There is a diagram which professes to show the "right and wrong positions of a horse's fore-legs," but the position is wrong in both of the examples given. In a shilling manual, treating of many subjects, it is of the highest importance to be concise; but in the little work under notice the author constantly goes out of his way to be diffuse, and the book contains many passages of the following type:—

The wild horses of the Ukraine are known to be descendants of animals that were originally subject to the dominion of man, the same as those found in various parts of the South American continent, which are supposed to have sprung from the stock first imported by the Spanish invaders; and the origin of the wild horse in Tartary has been assigned to the period of the siege of Azoph in 1657, when a number of horses were turned loose from want of forage. Of this fact Byron has made use in his story of *Mazepa*, a stirring narration, assumably told by the flickering flame of the bivouac-

fire, and one that will always hold a foremost place amongst those incidents of fictitious story which enchain the imagination, and arrest the attention, by their vivid picturesqueness and truthful semblance.

Whatever the merits of this book may be, we cannot endorse its pretensions to be indispensable.

#### BROOK'S FRENCH HISTORY FOR ENGLISH CHILDREN.\*

THIS is a pleasantly written book, which children are likely to read. The author knows how to teach; it is therefore the more pity that she does not always know what to teach. We open her book, and find it beginning in the old unscientific way:—"The country which we now call France was not always called so." "When it is first mentioned, . . . it is called Gallia, or Gaul." "If you look at the map you will see that France is a country about three times as big as England," and then follows an account of its boundaries—that is to say, its present boundaries—as if France had existed in its present extent from all eternity. No doubt these statements are geographically true—that portion of the earth's surface which is now called France was once comprised in a larger territory which was called Gaul; but politically and historically they are utterly misleading. No one who has been taught to begin French history in this way will ever grasp the fact that France, politically speaking, is a State which has gradually grown up round the city of Paris, until at last it has absorbed the greater part of the ancient Gaul. Later on, and as it were incidentally, the author does explain these things; but no after explanation is likely to do away with the erroneous impression given at the outset. Miss Yonge's little school History of France would have shown Mrs. or Miss Brook, had she consulted it, a more scientific way of approaching the subject. Or, indeed, the map which faces her own first page—a map of German execution, and therefore, we need hardly say, beautifully done—might have suggested some ideas to her. "If you look at the map," she says, "you will see," amongst other things, "some way to the east of the eastern boundary . . . a river called the Rhine." Naturally the reader's eye turns to the map at hand, and there he will see the "Rhenus," not some way to the east of the boundary, but forming the boundary itself. Also on the east, she says, you will find "the Alps, Germany, and Belgium." One looks at the map, and finds no separate Belgium, only "Belgica" as a district within Gallia. All this will probably puzzle the reader, if he happen to be an intelligent child. The fact is, that when the author talks of "the map," she means, not her own map of Gallia, but the modern map of France, which for historical purposes is useless. Exception on the score of accuracy may also be taken to the statement that "many of the rulers of France have wished and done their best to conquer the countries between France and the Rhine, but in this they have never succeeded." What she means is that the conquest has not been permanent; for at p. 428 she herself mentions the cession of the Rhine provinces at the Peace of Luneville.

The maps are a strong point in the book. There are nine of them, ranging from B.C. 51 to A.D. 1811, the last being the least satisfactory, as Great Britain and the French Empire have been tinted with shades of pink which, if they are not absolutely identical, require the eye of a milliner to distinguish each from the other. At the first glance, the impression conveyed is that Great Britain forms an outlying portion of the Napoleonic Empire—an idea which certainly should not be suggested to English children. It would also have been well to give one more map to show the limits within which France was reduced after the fall of Napoleon. But maps, however good, are of little use to learners unless the text is adapted to them, or they to the text. Our author duly mentions the acquisition of the "Three Bishoprics"—Metz, Toul, and Verdun—by Henry II. (1552); so far so good. But presently we come upon a map dated "1589-1610," in which Toul does not appear at all, and Verdun and Metz are distinctly outside the French frontier. The explanation is simply this, that Metz, Toul, and Verdun were not formally ceded by the Empire till 1648—a fact which we do not find mentioned in the text—and that the German feelings of the mapmaker have not permitted him to recognize their practical annexation by France nearly a century earlier; but how is the pupil to guess this? Two lines in the text would have made the matter clear. Then there is an elaborate map showing, amongst other things, the "Dominions of the King of England after the Treaty of Bretigny in 1360"; yet neither the name nor the date of the treaty appears in the text. Whether little children can really be made to understand maps may be doubted; but, if they are to have any chance of doing so, the maps and the reading should be illustrative of each other.

Want of precision, and deficient comprehension of historical geography, are in short the great faults of the book. Disciples of Mr. Freeman will shudder at finding Aquitaine, in the time of Louis the Pious, described as "a province in the south of France." Similarly, the fact that in the division of 817 one of the sons of Louis had Aquitaine assigned as his portion is expressed by saying that he "was to have a small part of France." If the writer had consulted her own maps she would have seen that the ancient Aquitaine, even in its more restricted sense of the land between the Loire and the Garonne, and not in the wide sense in which it includes the Spanish March, was not a very "small part." From

time to time, however, she strives after more accurate nomenclature, as when, at p. 47, after speaking of the period of the Treaty of Verdun in 843, she says, "From this time we may begin to use the word France, which has been the name of the country since the time of King Charles"; just as if she herself had not been perpetually talking of "France" before. At p. 49 we are told that "France was divided into many provinces"; at p. 52 that "among the other provinces or divisions of the country was one named France, which was gradually giving its name to the whole." Here again the statements are all true after a fashion; but the way in which the writer uses the word France, first in one sense, then in another, is hopelessly confusing. Clearness and precision in the use of the terms Gaul, Francia, and France are the first requisites in explaining the history of the growth of the modern State of France. From Hugh Capet's time onwards the book becomes much better, though no mention is made of the annexation of Lyons by Philip the Fair.

On the subject of the Roman Empire the author is not strong. She starts with what seems to be a confusion between Constantine and Theodosius, saying that "the first Christian emperor" "left two sons, one of whom ruled in Rome, and the other in Constantinople." In truth, Constantine left three sons, among whom his dominions were for a short time divided. The writer is probably thinking of the more lasting dual division of the Empire between the two sons of Theodosius in 395. Moreover she seems unaware that the Empire had already been divided before the time of Constantine, and that he re-united it. Then she says that "since the barbarians had taken Rome, there had been no Emperor of the West." As she gives no date, most people will understand this to refer to the famous taking of Rome by Alaric in 410, and will be puzzled to reconcile it with the fact that the succession of Emperors of the West went on till 476. Next she talks of "Charlemagne" becoming "Emperor of France, of Germany, and of Italy"—a description which shows that she is not under the fear either of Mr. Freeman or of Mr. Bryce. Worst of all is her attempt to explain the War of the Austrian Succession, where she describes how various princes "turned against Maria Theresa and said, whoever had the Empire, it should not be she." The question was whether Maria Theresa should have the hereditary dominions of the House of Austria, which are not the same thing as the Empire, though it is common enough for people to confound the two. The writer moreover appears to think that Maria Theresa's husband was made Emperor at the Peace of Aix-la-Chapelle in 1748, whereas he had been elected in 1745.

Despite its faults, the book has merit as a narrative; the stories are well told; the author knows what children will like to hear, and how to win their attention; and she has real powers of explanation, as is shown by her account of the rise and formation of the States-General. Another good point is that she does not dwell exclusively upon the doings of kings and nobles, but gives her pupils some idea of the condition of the mass of the people. She is moreover fair and tolerant and writes in a pleasant, appreciative manner, never allowing herself to become violent on one side or the other. It may perhaps be objected that she does not bring out how great a blessing to the country the Revolution, notwithstanding its horrors, follies, and evils, really was; but it is almost inevitable that its worst side should alone be visible in a narrative of this kind. The account of Bonaparte shows at first a little leaning to a belief in "Saviours of Society":—

Just such a man as had been wanted now appeared, and though he afterwards showed qualities which brought much trouble upon himself and his country, there is no doubt that at this time he did for France what no one else could have done so well, and helped the country out of the great difficulties into which its violence had brought it.

But the final summing up of Napoleon's character is a just one, though it is conveyed in a style which, meaning to be childish, has sunk into feebleness:—

Few men have had so remarkable a life. He was not a good man, but it is impossible to say that he was not a great one. He was one of the best soldiers that have ever been known, and had so good an understanding, that he seemed able to do everything well. But he was selfish, cruel, and ambitious, and carried away by the idea of his own greatness, and these faults led him to throw away the great opportunity he had of being of use to his country, and leaving a glorious name behind him.

The author concludes with a prettily worded "Farewell" to all readers "who have managed to come so far as the journey's end with me." Although she has much to learn before she can be considered competent to act as a guide, we must concede that she shows herself an agreeable fellow-traveller.

#### A MAN OF THE DAY.\*

THE co-operative method as applied to literature may at times prove to be felicitous in its results. But the experiment is hazardous, and the plea of dire necessity which will serve as a sufficient excuse for the framers of a Queen's Speech can hardly be urged in arrest of judgment by the writers of a joint-stock novel. The "authors of *David Armstrong*" are fortunately both anonymous as to their personality and indefinite as to their number; and we trust, therefore, that no individual sensitiveness may be

\* *French History for English Children*. By Sarah Brook. With Coloured Maps. London: Macmillan & Co. 1881.

\* *A Man of the Day*. By the Authors of "*David Armstrong*." 2 vols. London: R. Bentley & Son. 1881.

hurt by the suggestion which we feel bound to offer, that the member or members of the partnership in whom the faculty of writing a novel is, to say the least, dormant, should retire from any active share in the business, and leave it to be managed by the partners or partner in whom some of the requisite qualifications may be found. For while their joint production in *A Man of the Day* is sufficiently unfortunate on the whole, it is not by any means a failure altogether. The story was worth publishing, all things considered; and its authors have contrived with some ingenuity to force a definite verdict on the point from the pen of their critics. Almost at the close of the third volume the hero is moved to follow the old Ephesian precedent, and to burn his own priceless book:—

Slowly he rose, and taking them, one after another, from the table, he threw the pages of his new work into the fire, and held them there until they were all consumed. Months of toilsome thought, months of patient work, all gone in less than a quarter of an hour!

But though the book was burnt after a calm and balanced judgment by the author of its being, the baby, under exactly similar circumstances twenty pages earlier, was not burnt. In the baby's case, indeed, the judgment exercised was only that of the author of its being in the second degree, and not that of its immediate parent. "Accidents would happen; children had fallen into the fire and been burned to death before any assistance could be given; a sudden start would do it—or, perhaps, even if he just let it alone—and then—" But Adam Grey did not put his grandson into the fire, while Alick Lisle did put his literary offspring between the bars; and of the two decisions we are compelled to ask which, in the candid opinion of a reviewer, was the more to have been desired for the pages of *A Man of the Day*? On the one hand, its loss would not have been so terrible a blow to literature as was the act of Alick Lisle's self-sacrifice; for "he knew that with the work once published he would in all probability stand in the front rank of writers, shoulder by shoulder with the foremost thinkers of the nation"; but, on the other hand, the three volumes had very much in common with the baby—they were almost harmless, and "mamma" thought a great deal of them; they deserved to keep their innocent lives, and although to read them straight through was not a very lively occupation, still, there were drearier ways of spending a rainy day.

The story has a certain unity of design, but resembling that of a semi-detached house, or, more strictly, of a pair of such residences, with their party wall in common. Two ideas or motives may be traced throughout, and it is possible that each of them is the property of a separate author. Of the two, one is reasonable in itself, and is reasonably well worked out; but this cannot be said of the other, and we do not know that its owner has materially improved upon Adam Grey's device for getting out of the general confusion by burning the baby. In this division of the work we are unable to find either any constructive merit to compensate for its ethical shortcomings, or any moral excellence to atone for its artistic faults. It is no discredit to a novelist that he or she fails to reach the level of George Eliot; but a bad copy, with variations, of Hetty Sorrel, is not a pleasant object to look upon, and Father Grey's relations with Percy Scott present nothing but the most ordinary conditions of folly and vice in combination. Upon what principle it is to be supposed that everything came out right at last by virtue of a dream in England and an assegai in South Africa, preceded by a few fine words about a girl as "My wife in the sight of God," who was confessedly nobody's wife in the sight of man, we cannot even conjecture; and the whole of this disagreeable episode spoils *A Man of the Day* for a purpose which the book might otherwise have served well enough—the aimless and harmless reading of the holidays and the seaside. In the construction of the episode as a work of art, it appears uncertain whether the author did not know his or her own mind, or whether the interest of the reader was intended to be kept up by a succession of false scents. There is a cigarette, secretly picked up and preserved by the mole-catcher, but nothing comes of it; vows of vengeance, promises of protection, again uttered and repeated by the mole-catcher, are just as resultless; the baby, some time before he became the subject of his grandfather's pleasant meditation, has been apparently drowned in a mill-pond, only that the mole-catcher opportunely dives after him; and, finally, the mole-catcher himself, who combines hidden depths of character with an inborn taste for poaching, fails entirely to develop into a moral and intellectual hero, and is left "carrying the baby about untiringly" on his back. In the ordinary life of an English agricultural district, Esther would probably find herself, some ten years after the end of the third volume, putting up with this humble admirer as her only chance of a home; but the author takes care not to say so.

The experienced reader of novels will infer, from the mention of Dick Hepple's poaching proclivities, that the authors of *A Man of the Day* are unable to withstand the attractions of the criminal law, and he will anticipate the usual consequences. Is it too much to ask of publishers that they will, in every case where a writer does not make affidavit that his story contains neither lawsuit, trial, nor last will and testament, submit the sheets to a member of the junior Bar, at the author's expense? Dick Hepple has been found by the keepers on a public footpath, or near it, with snares in his possession, in broad daylight. He "hits out," but is at once overpowered and captured. The case goes to Quarter Sessions in due course; and "public feeling ran high against the prisoner in the upper and middle classes; in the

lower there was pretty generally a sneaking sympathy roused in his behalf." Life in Northumberland must have been otherwise a little dull at the time, one would think; but that may pass. Alick Lisle "was served with a summons to appear as a witness for the prosecution"; and, when the trial came on, the head keeper and the watcher were "closely questioned by the prisoner's solicitor." After this, Alick was called, and "tried to give his evidence in as clear and concise a way as possible, on Dick's behalf"; but, "on cross-examination, he was obliged to admit" certain awkward facts, and was generally badgered, as rustic witnesses under cross-examination sometimes are. Then the prisoner "pleaded Not Guilty; and, in defence, confirmed the statement that Alick had made of the case"; but, previously to this, "the watcher, who had already borne witness, volunteered" some "further testimony"; and, in the end, "the jury found the prisoner guilty." "Alick felt wild with indignation"; "his character had been blackened, and his good name sworn away"; which, considering that he was subpoenaed for the prosecution, and that the jury had convicted, is about as intelligible as the rest of the proceedings. One unfortunate result, we regret to observe, has arisen out of this poaching business:—"Lord ——— did not like the idea of becoming more unpopular than he already was in the district, owing indeed to no fault of his own." We can only trust that "Lord ———," whose name we of course suppress, will have lived down his "unpopularity" by the time he is old enough to go to Eton; and we take leave to suggest to the authors of the story that the small outlay of one shilling in money and one minute in time will save them in future from the repetition of an oversight which nothing but inexcusable carelessness can redeem from being an impertinence.

The "Man of the Day" must apparently be Alick Lisle, who is first introduced to the reader on the horns of a dilemma. He is then a small child with a thirst for knowledge, but he is too ragged to go to school in his own clothes, and too proud to wear the cast-off raiment of his master's son. The difficulty is obviated by a reasonable legacy, and he goes on through the stages of farm-boy, assistant keeper, and contributor to the "Banner of Freedom" till he reaches, as we have seen, the level of "the foremost thinkers of the nation." He is nearly, if not quite, self-educated; and his mental growth has advanced till he ceases to believe in anything except natural history and Nelly Scott. The last-named object of his faith has stayed at home at the farm, believing what she has been taught, and particularly anxious that Alick, when he comes home on a visit, should go with her to church, to which Alick violently objects. He does indeed go, but he comes away from the service in a very bad temper, and with "a brow black as thunder." This was hard on poor Nelly, though her motives, it must be allowed, had been mixed. It would do Alick good to go to church, certainly; but still in that part of the country "it was held as a decided token that the young folks were engaged" if they were seen together at church; and Alick had not been quite as ready to come to the point as he might have been.

The mental struggle is fairly conceived, and up to a certain point fairly well worked out. It is not a mere strife between the intellect and the heart, or a balancing of reason against passion. The conditions of novel-writing make it necessary that the young woman shall win in the immediate end, and the question whether the old woman will remain winner is conveniently beyond the horizon; but Alick's difficulty is a serious one while it lasts. He is neither able to change his own opinions, nor willing that Nelly should share them. He would not like to see the image of his own scepticism reflected in the life of a simple country girl. He will not either play the hypocrite himself, or allow Nelly to make a sacrifice from which he foresees nothing but misery. The statement of the difficulty is more easy than its solution, and we must not be too hard on the authors in respect of the somewhat colourless and washed-out creed in which the ultimate *modus vivendi* is found. The old farmer, Nelly's father, took a very reasonable view of matters in the light of the world's experience:—"Alick Lisle was a manly, straightforward chap; and all this newfangled nonsense would pass away when he got a bit older, and had a wife and bairns of his own—ay, and property of his own; it always turned out so anyway."

Farmer Scott's anticipations of "property" for Alick in the future hardly boded well for his nameless and unrecognized grandson; but Alick, if he had only known it, might have seen his way to fortune on his own account. The great work which he so ruthlessly destroyed might, or might not, have been a financial success; but the secret of its destruction, if his biographers may be relied on for the facts, was itself the key to prosperity. It was "a formidable pile of closely-written foolscap, the work of months of thought and care, carefully revised and copied, lying all ready to be sent to the publishers"; and it lay in "a cosy, comfortable room," provided, no doubt, as such rooms usually are, with a grate of the ordinary construction. Within the space of a quarter of an hour, the "formidable pile of foolscap," representing the still more formidable literary weight of the "new work," had been "all consumed" in the sitting-room fire. If it were possible to make a clearance of written, to say nothing of printed, matter, on such easy terms, not a few of us would be only too glad to pay a handsome royalty for the privilege; but, for security against possible accidents, it would seem desirable that the publishers of a good many modern novels, before settling down to the reading of the manuscripts, should provide themselves with an irremovable fire-guard.

## CHURCH'S STORIES FROM HERODOTUS.\*

STORY-BOOKS for boys have of late years improved almost as much as picture-books for younger children. It is not very long since the only condition necessary to be fulfilled by art or literature for the young was that it should be too bad to be seen before their elders. The ridiculous books of adventure in which considerations of probability and rules of grammar are impartially set at defiance cannot indeed be said to be entirely obsolete. The magnanimous Redskin, and the high-souled trapper who employs his rare intervals of sobriety in performing actions of chivalrous daring, still flourish the blood-stained scalping-knife and aim the unerring rifle for the delight of uncritical youth; but, so far as we are aware, no one has ever asserted that books of this description have any of the evil effects produced upon readers of a lower class by the study of *Jack Sheppard* literature. Even the worst of Captain Mayne Reid's many imitators, who reproduce his defects while they lack the vigour which in a great measure atoned for them, have probably little evil to answer for beyond the hazy notions of English construction which they may occasionally instil into their readers. We cannot, however, bring ourselves to regret the fact that their circulation is growing less every year. It is with a feeling of more lively satisfaction that we notice the absence from many a boy's bookshelf of those absurd pictures of school life as it is not, in the writing of which Dr. Farrar used once to spend much of the time not occupied in the more direct instruction of youth or the composition of Scriptural biography. It has been said of several schoolmasters who have in other respects been eminently successful that they had an unfortunate knack of making a prig of every clever boy who came into their hands. A more excellent means for attaining to this end could scarcely be conceived than the tales of vicious schoolboys who after wavering for a few years between the sinful lusts of the flesh and the precepts of the Church Catechism, run away to sea, and return, worn out by suffering, to die in the odour of sanctity surrounded by their weeping relations. It is not easy to overrate the services which have been rendered to the cause of education by those who have helped to replace such stuff as this by wholesome books which will amuse boys in their leisure hours, and encourage literary tastes without ministering to the desire for silly sensation on the one hand, or fostering priggish self-consciousness on the other. One of the most satisfactory means by which this desirable end has been attained is the reducing to a simple and interesting form those classical works which, from being written in a foreign language, or because they contain some matter not desirable to be set before children, and many thoughts and expressions beyond the range of common intelligence, are not, in their original form, accessible to the young. Charles and Mary Lamb's *Tales from Shakespeare*, of course, one of the earliest and best of such works. With its help children may gain a knowledge and appreciation of Shakespeare far better than that which is given them by some of their teachers, who, if we may judge by examination papers which we have seen, regard the sources from which the plot was drawn, and the probable date of the play's composition, as far more important points than knowledge of the play itself. Chaucer, too, has been adapted more than once, and, in one case at any rate, with conspicuous ability; but there are many classical English writers yet untouched whose works would readily lend themselves to such treatment.

No one has done so much to make boys familiar with the great writers of Greece and Rome as Mr. Church. In his *Tales from Homer*, *Tales from Virgil*, and *Tales from the Greek Tragedians* he has at once put into their hands a series of charming story-books, and proved in a very practical way that the works of classical authors are not merely so many examples of inflexional eccentricities and collections of syntactical puzzles. It is impossible for boys to take an interest in an author from laboriously translating small portions of his work as grammatical exercises, and perhaps even Mr. J. S. Mill, who tells us that he read Herodotus in the original Greek at the age, so far as we can remember, of four years, would have been glad of the help afforded by the volume which Mr. Church has just added to his series. The present work is a worthy companion to those which had been previously issued. Herodotus is perhaps, with the exception of Homer, the world's greatest teller of stories, and Mr. Church has found in the earlier half of his history tales enough to fill a volume, leaving, we hope, "Stories of Greece from Herodotus" for the subject of a future book. First, we have the history of Croesus, with the episode of Atys and Adrastus, and the defeat of Croesus by Cyrus. Then, following the order of Herodotus, Mr. Church relates the birth and bringing up of Cyrus, his revolt against Astyages, and the conquest of Babylon. Next comes, what is perhaps the most interesting part of the book, the account of the manners and customs of the Egyptians, with legends of certain of their kings. The amusing story of the treasure-house of Rhapsinitus is sure to be a great favourite with the younger readers of the book from its close resemblance to some of the tales in the *Arabian Nights*. These stories lead on to the invasion of Cambyses, his death, the usurpation of the false Smerdis, the conspiracy against him, and the accession of Darius. The two following chapters tell of the revolt of Babylon and its capture through the ghastly stratagem of Zopyrus, and of the campaign of

Darius against the Scythians. The account of the Scythians and neighbouring nations brings the book to a close. It is difficult to imagine a better execution of the task which Mr. Church has set himself. The stories are simply told in rather antiquated English, admirably suited to the matter of an old-world writer like Herodotus. Mr. Church says in the preface that, though he has kept as close as possible to his original, he does not profess to have translated it. Compression and paraphrase have of course been unavoidable in many places; but very often Mr. Church's translation is close and scholarly, and his version of some passages is worthy of comparison with the *Olysses* of Messrs. Butler and Lang, of which his style often reminds us. Higher praise than this can scarcely be given to any translation. It is impossible to read these stories without wishing that Mr. Church would undertake a translation of the whole history of Herodotus. It is a task which has never yet been satisfactorily accomplished, and Mr. Church possesses in a remarkable degree the two qualifications most necessary for the work—good scholarship, and complete mastery of a pure and graceful English style. We may quote the following passage, translated from Book I., Chapter 86, in evidence of both these qualities:—

But when Croesus stood upon the pile, and the fire had now been put to it, there came into his thoughts, notwithstanding the great strait wherein he stood, that the saying of Solon was indeed true, and spoken by inspiration of the gods, when he said that none of living men might be counted happy. And when he thought of this he cried with a loud voice, having before kept silence altogether, "Solon, Solon, Solon!" which, when Cyrus heard, he bade the interpreters ask of Croesus who was this that he called upon. But when the interpreters asked this thing, for a time Croesus kept silence, but afterwards, for indeed he was constrained to speak, made this answer, "He is one with whom it would be better than many possessions for all rulers to have speech." Then, as no man could understand these words, they inquired of him again what they might signify. And as they were earnest with him and would not leave him in peace, he told them how there had come to his coast one Solon, a man of Athens, who having seen all his wealth and prosperity, had made little account of it; and how that there had befallen him all that this same Solon had said, though indeed the man spake not of him in particular, but of all mortal men, and especially of those who judged themselves to be happy.

Mr. Church is happy, too, in his paraphrase of the replies of the Delphic oracle to its credulous votary. Here is his version of the prophecy relating to Cyrus:—

Man of Lydia, when the mule  
O'er the Median's land shall rule,  
Think of name and fame no more,  
Fly by Hermes' stony shore.

If we substitute "pebbly" for "stony" as a translation of *πολύ-ψήφια*, the rendering is nearly perfect. As regards the matter of the stories, they seem to contain all the elements necessary to make them popular with young readers. For sustained interest, the story of Croesus is perhaps to be placed first, though perhaps too much is made of that part of it which is concerned with the Greek oracles. Those whose taste is for the marvellous will be gratified by the account of the manners of the Egyptians, the tales of the Indian gold-gatherers and the huge ants which pursued them, and of the wonders of Arabia, while the description of the barbarous Scythians and their neighbours will delight every boy who takes up the book, and many older people too.

A notice of a book intended mainly for children would be incomplete without mention of the illustrations. These consist of specimens of Egyptian, Assyrian, and Persian art taken from bas-reliefs and wall-paintings. They have been well selected, and carefully reproduced in colour. The Egyptian wall-paintings certainly deserve the highest commendation, rather for the reason that they lend themselves more naturally than bas-reliefs to the process of printing in colour than from any inequality in the execution of the various plates. Perhaps the best of all is the one representing an Egyptian fowler who is knocking down vast numbers of birds as they perch on the tall papyrus reeds, while a cat acts as his retriever. His child, seated in the bottom of the boat, is picking a water-lily, while his wife stands at the stern, and a procession of fish accompanies the boat with a solemn regularity which has greatly amused those young people to whom we have, by way of experiment, shown the pictures. Still more entertaining to grown-up people will be the painting of an Egyptian feast, which suggests that the idea of lunching on the fragrance of a flower is not altogether an original product of nineteenth-century æstheticism.

We cannot take leave of Mr. Church without repeating the regret already expressed that he should devote his best literary energies to the production of books for children. While we fully recognize the educational value of really good "play books," and appreciate the services of those who, with a capacity for higher work, devote themselves to the production of such books, still, works like the present volume, even though they may be absolutely perfect in their way, can do little towards creating for their author any permanent reputation as a scholar and a man of letters.

## FRENCH LITERATURE.

IF the history of the seventeenth and eighteenth centuries in France is not fully understood, it will not be the fault of the present generation of Frenchmen. We commented last month on the numerous monographs, some of them of the greatest value, which MM. Didier have lately published in reference to seventeenth-century history. The following century is, relatively speaking, not quite so much in favour, but it has plenty of students.

\* *Stories of the East, from Herodotus.* By the Rev. Alfred J. Church, M.A. London: Seeley, Jackson, & Halliday.

M. Alphonse Jobes (1), who is already the author of a voluminous *France sous Louis XV.*, seems to be working through the reign of Louis XVI. in the same conscientious manner. He has already published a volume on Turgot—that is to say, on the first three years of “*Astrée Redux*”; the present is devoted to the following seven, under the title *Necker et la guerre d’Amérique*. These separate titles, however, only indicate the subjects which seem to M. Jobes the most important ones in his volume, not those to which he has given preponderant, much less exclusive, treatment. The volume is a careful and full summary of all the principal events between 1777 and 1784—the death of Voltaire, the siege of Gibraltar, the struggle in India between France and England, &c. &c. M. Jobes’s work is not remarkable for style, though, when he does not attempt to be eloquent, it is written in a very fair, straightforward, readable fashion. But he is diligent, full, and apparently impartial and accurate, seeming to possess considerable sobriety of judgment.

*La France et l’Europe* (2) is one of the curious books which are doubtless extremely important in the eyes of their authors, and which deserve to be treated with a certain amount of respect because they are transparently honest and well-intentioned, but which are utterly unpractical, and not amusingly unpractical. It is an elaborate essay to prove that in the present ills of France and Europe there is nothing for it but a European federation with a general abolition of armies, an international gendarmerie, a strict abstention on the part of the Federal Government from meddling in the internal affairs of the component States, &c. M. Poinot de Chanasac seems to have been born thirty or forty years too late. Between 1820 and 1850 he might have found listeners who would take him seriously, but not in the Bismarckian age.

Dr. Doherty, who, as we learn from the fly-leaves of his volume (3), has already published in English a work on Organic Philosophy in five volumes, appears to be translating it into French. The book deals with so large a number of subjects, from the “evolutive perfectibility” of man to the distribution of the ocean into habitable depths, uninhabitable depths, &c., that we can hardly do more than mention it here.

The merits of Dr. Bouchardat’s treatise on Hygiene (4) must be left to specialists to estimate. It seems to us, however, that Dr. Bouchardat has attempted to do too much. Even a stout octavo of twelve hundred pages is scarcely enough for the handling of the multiplicity of subjects (concerning not merely hygiene proper, but a vast number of matters connected with it) which he has included in his plan. Some of these are certainly treated in a manner rather perfunctory, while others, especially the section on food, contain a vast mass of not very relevant details.

M. Lemerre’s useful series of school books has been enriched by a modern history (5) in two compact little volumes, and by an excellent History of Greek Literature (6) by M. Eugène Talbot. The latter subject being thoroughly manageable in the space, M. Talbot has had a decided advantage over his colleague M. Zevort, who has almost of necessity been reduced to a bald and rather indigestible epitome. There is, indeed, one merit in these sketches of general history—that they serve to keep in mind what is too often forgotten, the coincident fortunes of different countries. Otherwise we rather doubt their value.

Two new volumes of the *Bibliothèque utile*—one on the ethnology of Europe and Asia (7), by M. Girard de Rialle, the other on the history of Prussia (8), by M. Doneaud—appear to be very careful and good. The latter especially, which, in the present temper of Frenchmen, is not an easy thing to write, has been, as far as we have examined it, very accurately and impartially done. M. Girard de Rialle seems to have gone to the best authorities, and has arranged his results well.

Of collected editions of the *chroniques* of Paris newspapers there is no end. The volume (9) of MM. Mardoche and Desgenais—pseudonyms, of course—is a kind of gossip-annual for 1880. It is rather more seriously (we do not mean more dully) written than most of its congeners, and some of the papers bear resuscitation very fairly.

It is barely possible that some English readers may have a very dim idea as to what the Ligue d’Union Républicaine is or was, and their ignorance would not perhaps be very blameworthy. It was formed by certain strong Republicans (but not of the very reddest type) to mediate between the Communists and the Moderates at the time immediately after the war. It failed, of course; and M. André Lefèvre (10) has enshrined in this volume a history (with an apology) of its failure. It is written in a bitter and abusive spirit towards Thiers, and in a

tone of very mild censure of the Communists; and the author cannot be said to be either impartial or accurate. To say, as M. Lefèvre says in his introduction, that M. Gambetta’s failure to triumph over the Prussians was due to the efforts of a Bonapartist, monarchical, and clerical combination, and that the provincial reaction rejoiced over the surrender of Paris and the woes of France, is at once incorrect and foolish. It is incorrect, for every one knows that the Legitimists, at least, distinguished themselves nobly in the struggle, and certainly did not feather their nests, as did certain Republicans. It is foolish, because it shows that M. Lefèvre is not in possession of knowledge or judgment sufficient to pronounce on the situation at all. A Marlborough or a Napoleon might possibly have enabled M. Gambetta’s raw recruits to beat the disciplined and victorious Prussians; but certainly nothing else could.

In *Les imams et les derviches* (11) Major Vladimir Andrejevich, or, to give him his Turkish title, Osman Bey, has collected together a certain amount of information, interspersed with a good many anecdotes, about Turkish religion and its ministers. The book seems trustworthy enough, but it is of a rather unsatisfactory class—the class of books which are neither scientific and elaborate treatises capable of serving as books of reference nor literary essays actually valuable as literature.

Attempts at arranging Oriental and ancient religions in harmonious classification according to a system of some sort or other are not unfrequent. *L’Orient dévoilé* (12), which seems to have reached a second edition, has nothing of occult lore in it, as its title may seem to promise, but is simply an historical and mythological catalogue raisonné, influenced a little here and there by theory, but on the whole sober and scientific enough in its treatment of facts. Passages of rather rhetorical discussion are indeed interspersed; but to authors who treat of subjects of this kind this is a perquisite not fairly to be refused.

Messrs. Hachette’s elaborate and valuable *Nouveau dictionnaire de géographie universelle* (13) has reached its sixteenth part, which is especially worthy of notice because it contains the article “France.” Sixty pages of the largest quarto size, printed in small but legible type and in treble columns, contain perhaps the fullest description and the largest collection of statistical information that has ever been got together in an article of the kind.

We have received from M. Rothschild a considerable parcel of the admirably produced works on science and art, in the getting up, and, above all, in the illustrating, of which he has few rivals among the publishers of Paris, and hardly any elsewhere. M. Heiss’s study on Vittore Pisano (14) is a first and apparently a tentative instalment of a history of the medallion sculptors of the Renaissance, which, if completed, will be a splendid work. All students of the Renaissance know that we owe to Pisano some of the most characteristic portraits of the despots of the earlier fifteenth century. The illustrations, rendered in permanent photographs of the size of the original, and supplemented by numerous woodcuts in the text, leave nothing to desire. Among the heads, those of Filippo Maria Visconti and of Sigismondo Pandolfo Malatesta are the most striking. It is a pity that the curious and evidently life-like medal-portrait of Isotta of Rimini, the only woman who contrived to retain the affections of Malatesta, the typical Renaissance tyrant, is apparently spurious.

The same publishers send us an elaborate and sumptuous illustrated monograph on the Bee (15); a history of Orchids (16), with woodcuts by the hundred, and with fifty chromo-lithographs which are hardly inferior to hand-coloured engravings; a new edition, with new and excellent diagrams and illustrations, of M. Demontzey’s standard treatise (17) on Reboisement; and (also in a second edition) a very useful and well-illustrated treatise on Precious Stones (18). Of less sumptuous appearance, but equally full of “cuts,” is a small handbook of Pisciculture (19), an industry pursued, as most people know, with abundant success in France, and very scantily in England.

Dr. Gustave Le Bon’s two stout volumes on Man and Society (20) are instances, not the first by many hundreds, of the attempt to do too much, and of the tendency which such an attempt has to confuse the writer as well as the reader. If Dr. Le Bon had confined himself to giving a lucid account of the actual discoveries, as distinguished from mere hypotheses, of anthropologists and sociologists in these latter days, he might have done good service. Unfortunately he has gone further, and has embarked on matter altogether contentious, and in which he is delivering himself, not of facts, but of opinions. To give the dimensions of the Neanderthal skull and the shape and probable uses of flint implements—

even to state the evidence for the hypothetical descent of man—is one thing, and a very useful one. To proceed to deliver judgments on the obsolescence of religious creeds, on the uselessness of classical education, and on the immense difference which separates men and women in the higher civilized races, is another, and in this case a somewhat useless, thing, because, though Dr. Le Bon is a very fair abstracter, he has evidently no turn for argument. An opponent of classical education who says that the ability to translate Thucydides is a proof of nothing but memory establishes one of two facts—either that he himself has not the slightest notion of Thucydides in the original, or else that he is intellectually incompetent to form an opinion.

Dr. Wershoven's technical vocabulary (21) of English and French scientific terms is likely to be useful, because most dictionaries are extremely deficient in this particular. We think, however, that it would have been more useful if it had been arranged dictionary-fashion, so that the required equivalent for a French or an English word might have been found at once. There are indeed indices, French and English, which enable the discovery to be made, but they are not entirely complete—for instance, "unit," in the electrical sense, does not appear, though "Siemens' unit" does—and they involve two operations instead of a single one.

The August number of the *Revue des Arts décoratifs* (22) contains an article on the recent Exhibition of Spanish and Portuguese Art at South Kensington. The chief illustration of the number represents some backs of hand-mirrors carved in wood, and of considerable merit.

M. Ollendorff seems to be the latest of the long line of poetical publishers who have existed since 1830, with Renduel for the first and most famous of them, and M. Lemerre in recent days for the most sumptuous, and, for a time, the most fertile. M. Lemerre has taken of late to grave scholastic works and ornate reproduction of classics, and the little three-franc volumes which in the palmy days of the *Parnasse* figured on his lists by scores issue but rarely from his press. M. Ollendorff seems to admit more variety in his format than most of his predecessors in the honourable function of ushering young poets into the world, and the bundle of poetry and drama which we have before us consists of volumes of very different shape and size. We have a couple of monologues in prose of the kind for which there is at present a rather incomprehensible rage in France, due probably to the talent of M. Coquelin cadet. Even M. Coquelin, however, could not, we think, have made much of *Un homme à la mer* (23), though he seems to have done it the honour of reciting it. It is a tissue of idiotic puns interlarding a very stale description of the miseries of seaside life. *De la prudence!* (24) is very much better. It is a sharp satire on the present régime in France. A new Procureur Substitut goes down to his post, and the friend who has obtained the preferment for him counsels him on his behaviour, always winding up with the horrified ejaculation, "De la prudence!" The unhappy lawyer has a wife named Eugénie—an insult to the Republic which is not to be thought of; he hires a house near the Cathedral—madness! At last, when it appears that prudence requires that Eugénie should call upon the wife of a strongly Republican Colonel, who is known to be a ci-devant camp follower of no reputation at all, the Procureur strikes, and throws up his position with an "Et en voilà de la prudence." The little piece would shock M. Paul Bert dreadfully, but it is very sprightly and a good example of its kind. *Piccolino* (25) is a very miniature comedy—in fact, merely a dialogue between a Sultan and the heroine, a wandering but virtuous young woman of French extraction. Piccolino is disposed to fall in love with the Sultan; but by an effort of self-denial he refuses to expose her to the degrading influences of the harem and sends her away. The verse is pretty, but the sentiment is rather conventional and at the same time overstrained. It is dedicated to M. de Bornier, who compares it to the work of François Coppée. We rather agree with the author of *La fille de Roland*, but we are not sure that the comparison is complimentary. Next to Heine's poems *Faust* is perhaps the most constantly and the worst translated masterpiece of German literature in English. The renown of Gerard de Nerval's version has probably deterred many Frenchmen from undertaking it. But, after half a century, M. de Riedmatten (26) may fairly contend that a new version in verse is desirable. His own is very fair, and a good deal better than most of ours in English; but we are afraid that Mr. Matthew Arnold would hardly accept as a refutation of his doctrine of the inferiority of French to German poetry this version of the *König in Thule*:—

Il était un roi de Thulé,  
Garlant toujours inconsolé,  
Don suprême de son amant,  
Une coupe en or ciselé.

M. Cabaret has produced a very nice little book (27), in which he shows himself an astonishingly clever imitator. The miracle of Auerbach's *Keller* itself (*Faust* is fresh in our memory) is hardly

more surprising than the ingenuity with which he makes something not too unlike the genuine Hugo, Musset, Baudelaire, Gautier, cover the page at his bidding. But then, after all, it is not the genuine, and imitations in poetry are of singularly little worth. On the other hand, M. Harel (28) does not seem to have specially imitated any one, and his verse has a decidedly pleasant freshness, much more resembling *serpolet* than *ail*. M. Harel, it seems, combines the vocation of poet with the profession of hotel-keeper and cook, and some of his descriptions of dinners are highly appetizing.

We have before us no less than three of those collections of short tales in which French literature at its best is unrivalled, and of which there are still left practitioners not to be despised. The subjects of the pleasant writer who calls himself Viscount Richard O'Monroy (29) are, unluckily, too often chosen rather beyond the limits allowed to story-tellers in England. But they are scarcely further outside these limits than those famous little masterpieces of M. Droz over which even the most straitlaced readers have consented to laugh, and, if their morals are no worse, the manners and breeding displayed in them are even better. The Viscount writes thoroughly like a gentleman, and like a very good-natured gentleman too. His sketches of the *camaraderie* of garrison life are exceedingly pleasant, and often, as in *Une fête de famille*, entirely free from anything to which the sternest moralist can object; while there is at least as much good feeling as there is satire in his *Professions de foi aux femmes de France*. The fragmentary history of the *Cercle des truffes*, again, is exceedingly funny, and might pass even a severe censorship.

M. Eugène Mouton (30) (only some of which are new) are of the eccentric order, aiming rather at humour than at wit, and, like a good deal of French work which has this aim, falling too often into the merely extravagant and grotesque. *L'invalidé à la tête de bois*, for instance, which seems to be such a favourite with the author that he has illustrated it with an etched vignette, is an over-laboured and clumsy burlesque. If it is intended to be a satire on Chauvinism, which is probable, or on such tales of wonder as M. Jules Verne's, which is possible, it overshoots its mark. The same may be said of *Le naufrage de l'aquarelliste*, and *Les plaisirs du voyage*. Some of the smaller pieces, however, can be laughed at.

There is no fear of mistakes of this kind from the pen of M. Ludovic Halévy (31). Something of the same proviso must be made in his case as in that of M. Richard O'Monroy; but, this made, it may be said frankly that *Un mariage d'amour* and its fellows are worthy of *Les petites Cardinal*, and that is saying a great deal. *Les trois séries de Madame de Chateaubrun* is admirable.

Of novels of any length we have only two to speak of. *La bonne d'enfants* (32), which is a sequel, is a lurid story of vendetta, strangling, poisoning, &c. &c. *Le veuvage d'Aline* (33) is very much what might be expected from its author. It is, indeed, rather a pity that this clever writer should be so constant to a particular type of the novel as understood by M. Octave Feuillet. Still, *Le veuvage d'Aline* is not a book of which it is right to speak disrespectfully, if it were only for the delightful personage of Olga Baronne de Vesvre, the pleasantest specimen of the Russo-Parisian that we have ever come across in fiction.

(28) *Gousses d'ail et fleurs de serpolet*. Par Paul Harel. Paris: Ollendorff.

## THE TRANSVAAL.

THERE is little reason for surprise at the latest performance of the Boer Triumvirate, although a cynic might derive amusement from its consideration. The attitude of the Triumvirate throughout the negotiations might not inaptly be compared to that of the fisherman and his wife in the German story, who made one monstrous demand after another from the Turbot. There was, it will be remembered, a point at which the fish's patience gave way, and it may be hoped that at the present juncture the parallel will be found as close as it has hitherto been. The desire to make a one-sided agreement is perhaps neither novel nor unnatural, but seldom has such a desire been expressed with so simple or so cynical an openness. When it was first proposed that the QUEEN should be styled Suzerain of the Transvaal, some doubts were entertained as to the exact meaning or value of the title, and possibly its ambiguity may have encouraged the present attempt of the Triumvirate to make it an absolute cipher by rejecting the stipulations for the Suzerain's control over the external relations of the State, and power to veto laws. In agreeable contrast to the position proposed for the Suzerain is that modestly assumed for the President, who, in the estimation of the Triumvirate, is hedged with such divinity that it would ill become him to be a member of "any Commission." As might have been expected, the articles affecting native interests seem to the Triumvirate the reverse of acceptable. The third, which provides against any enactment affecting native interests being passed without consent given through the British Resident, is described as "opposed to the spirit of complete self-government." Four articles are objected to as "superfluous, and calculated to give offence." Among them is Article 16, which follows the Sand River Convention of 1852 in providing that "no slavery, or apprenticeship partaking of slavery, will be tolerated by the Government." At this, it would seem, the Triumvirate wraps itself indignantly in its virtue, and protests against the Boers—the natives' best friends—being told not to do what they never dreamt of doing. If it is granted, for the purpose of argument, that no Boer ever did, does, or will wish to have anything to do with "slavery, or apprenticeship partaking of slavery," then why, it may be asked, this indignation, which seems at least as "superfluous" as the articles objected to? It is generally found that the objections of people whose highly-strung natures are offended by the existence of laws and regulations are founded upon something more than sentimental delicacy. The same keen sense of honour which is roused by the prohibition of slavery and the suggestion that the President should be a member of the Native Location Commission, has led the Triumvirate, not unnaturally, to attempt the simple and not very original move of repudiation.

In fine, what the Triumvirate proposes to do is to accept every article favourable and to reject every article unfavourable to the comfort and supremacy of the Boers in a Convention already signed by the Boers' accredited representatives. The Convention was sent to the Volksraad not to be discussed point by point over again, but to be ratified or rejected *en bloc*—rejection to be followed by the reversion of the country to the British Crown on the 9th of next month. It is perhaps not strange if the Triumvirate have persuaded themselves that such a

stipulation as this may be safely regarded as an idle form, or that, so long as the present Government is in office, they have only to ask often enough and loudly enough in order to get whatever they please to ask for. But it is perhaps hard upon them that they should have been nursed in such beliefs; for, unless they learn wisdom in time, the process of disillusionment may turn out to be unpleasant. We have, it is true, learnt to be surprised at nothing that Mr. GLADSTONE may do, but it is scarcely to be imagined that the Government can hesitate for a moment as to the course to be pursued on this occasion. That the Transvaal troubles will come to an end with the acceptance of the Convention can hardly be hoped or supposed; but it will at least be well to postpone their renewal by firmness at this juncture.

## SIR STAFFORD NORTHCOTE IN YORKSHIRE.

SIR STAFFORD NORTHCOTE'S speeches at Hull and Beverley were not calculated to produce strong excitement. He was perhaps in some degree embarrassed or chilled by the knowledge that a formidable adversary would in two or three days take advantage of any opening which he might offer. The custom of delivering political speeches in the Parliamentary recess dates from the first Reform Bill. In earlier times sound political traditions had accustomed the people to public discussion, especially at county meetings. It has now become necessary to address speeches exclusively to the members of one political party. An audience which might have included any considerable number of Liberals would have silenced Sir STAFFORD NORTHCOTE by clamour before he had made much progress in his speech. Since little benefit is to be gained by confirming a belief in opinions already fixed, it might appear at first sight that oral supplements to the daily disquisitions of party newspapers were not urgently required; but there is a definite advantage in procuring the insertion of speeches on either side in papers which might otherwise never notice unpalatable arguments. It is for this reason that the publication of faithful reports of Parliamentary debates is essential to the efficiency of constitutional government. In the recess meetings of Conservative or Liberal Associations furnish to a certain extent a similar opportunity of public, though intermittent, discussion. When the leaders on both sides are equally matched, a comparison of their speeches is almost as instructive as an actual debate. The advantage which is enjoyed by the more brilliant and more effective orator is legitimate and unavoidable. Mr. GLADSTONE will probably enunciate at Leeds unsound and dangerous doctrines; but his eloquence will not fail to stimulate the enthusiasm of his followers.

It was probably desirable to impress on the Conservative minority of Hull the expediency of cultivating the art of organization. As Sir STAFFORD NORTHCOTE justly observed, a local opposition acts as a check on the dominant party, and it offers on some occasions valuable assistance to conscientious politicians of the majority, who may from time to time be shocked by the extravagance of their allies. There can be few moderate Liberals in Hull or elsewhere who feel any confidence in the present Government, though they may not be prepared to abandon their party. The

Conservatives, if they are prudently led, and if they abstain from adhesion to false doctrines, may expect with just confidence frequent accessions to their ranks. The apologists of outrage, the advocates of legislative spoliation, will alienate more and more the respectable members of the party. The hasty partisans whose theories would, if they were accepted, render impossible an otherwise inevitable coalition, are only less mischievous than the Jacobins of modern Liberalism. It is in no way desirable that the Conservative party should pack itself after the example of the Birmingham Liberals. The intolerance and tyranny of the Liberal Federation furnishes rather a warning than an example. It may be doubted whether Sir STAFFORD NORTHCOTE was well advised in devoting the earlier part of his speech at Hull to commonplaces about the virtues of Yorkshiremen. When an able man deals in empty phrases, he is suspected, perhaps unjustly, of either wishing to conceal his thoughts or having nothing to say. The leader of the Opposition in the House of Commons is not a believer in vulgar platitudes, but he sometimes seems to form too low an estimate of the capacity and judgment of his hearers. If Yorkshiremen deserve either the compliments which he paid them or their popular reputation for astuteness, they can have been but moderately flattered by praises of their supposed good qualities.

The speech at Hull would have been more effective if the attacks on the policy of the Government had been exclusively directed against one or two vulnerable points. Sir STAFFORD NORTHCOTE referred to the complications which exist, not only in Ireland and the Transvaal, but in Egypt, and in France since the suspension of the commercial negotiations. The result may be that a successful defence at any point will destroy or weaken the force of just criticism and censure. The Egyptian difficulty has not been recently created, though it may be aggravated by the consequences of Mr. GLADSTONE's wild language used before he was in office. The conduct of the Government with respect to the Commercial Treaty has been firm and consistent, and there is reason to believe that it has been regarded with general satisfaction. If Sir STAFFORD NORTHCOTE had been in office he would probably have followed the same course of exhibiting neither reluctance to conclude a treaty nor undue eagerness. Of the danger and humiliation which have perhaps already been incurred in the Transvaal it was difficult to speak too strongly. The Government is directly responsible for the natural consequences of its ignoble policy. To place the armistice and the Convention on the same level with the difficulties attending the negotiation of the French treaty is to facilitate the acquittal of the Ministers. The supineness with which Irish anarchy and the consequent usurpation of a rival Government are tolerated would alone have sufficed for an indictment of the Ministerial policy. Lord BEACONSFIELD, in a similar position, would not have wasted his indignation on secondary miscarriages when he had the opportunity of denouncing unpardonable complicity or weakness; yet it would be unreasonable to find fault with an able party leader for not possessing the same gifts by which his predecessor was distinguished. Sir STAFFORD NORTHCOTE, by his wide knowledge, his fairness, and his temper, inspires a confidence which is not less valuable than the enthusiasm which responds to rhetorical appeals. It is especially fortunate for the Conservative party at the present time that it is led by a sound and scientific economist. The party of subversion ought not to possess a monopoly, in questions relating to trade, of the sound doctrines which it utterly rejects when there is a prospect of agrarian spoliation.

In his Beverley speech Sir STAFFORD NORTHCOTE expatiated still more largely than at Hull on the duty of attending to local organization. He must have felt satisfaction in addressing an audience principally composed of farmers who had at the last election adhered to their proper political allegiance. It is true that, as Sir STAFFORD NORTHCOTE said, it is more difficult to secure party organization in counties than in towns. A body of electors dispersed over a wide district has less facility of combination than the population of a borough; and in some cases an electoral success may have been snatched in consequence of carelessness by an active minority. Such cases occur but rarely; but the prevention of surprises is a legitimate object of organiza-

tion. The supporters of the Government lately felt or professed confidence of success in Durham and North Lincolnshire; and they brought a candidate from a distance to contest the seat for Cambridgeshire. The Conservative journal which always favours the interests of the Government warned its nominal allies that their attempt to secure either Durham or North Lincolnshire was absolutely hopeless. The organization in both counties, whether or not it had been previously prepared, proved sufficient to ensure a defeat of the Liberal party. The Beverley audience may perhaps have been more deeply interested in Sir S. NORTHCOTE's account of the benefits which, during his tenure of office, he had conferred on the ratepayers at the expense of the Treasury. His partial rearrangement of the burden of taxation may have been just and expedient, and, after a vote of the former House of Commons, it was unavoidable. It was perhaps natural to assume in a speech addressed to rural electors that the benefit was conferred on owners and occupiers, though ratepayers in towns received a large portion of the boon. Railway shareholders also contribute an extravagant proportion of the rates which are supposed to be levied on the land; but it cannot be denied that Sir STAFFORD NORTHCOTE's financial legislation was, to some extent, beneficial to the agricultural interest. Mr. GLADSTONE may perhaps, under cover of a cloud of figures, seek to establish an opposite conclusion. In the present condition of public affairs it is impossible to follow up a side issue with serious attention. When the integrity of the United Kingdom is threatened, when unscrupulous agitators on this side of the Channel demand for purely selfish purposes the expropriation of landowners, the readjustment of rates and taxes excites but a languid interest.

#### EGYPT.

THE despatch of Special Commissioners by the SULTAN to Cairo has added a new difficulty to the many difficulties which the protecting Governments have to encounter in Egypt. The SULTAN can have no motive in sending these Commissioners except to assert his rights as suzerain; to make them apparent to all the world, and especially to the Mahomedan world; and, above all, to impress on the Egyptians that they belong to Turkey. The difficulty thus created is that it is convenient to the protecting Governments that the SULTAN should hold a suzerainty over Egypt, while it is equally convenient that he should never make this suzerainty more than a name. If the action now taken by the SULTAN is judged by merely technical rules, it must be owned that there is no objection to it. The present KHEDIVA holds his position in Egypt entirely by an exercise of the SULTAN's power as suzerain. His father was deposed because the SULTAN, having examined into the mode in which he had been governing Egypt, found that he had not been governing well. He was a Pasha who had been tried and found wanting. He was told by the SULTAN that he must go; he obeyed, as a matter of course, and went. The SULTAN told TEWFIK that he was to be the new Pasha, and TEWFIK at once became the new Pasha. In the process of time the new man is seen to be governing the country in a manner which causes his chief anxiety. He is the victim of a military revolution, he is surrounded by unpopular Ministers, and only changes his Ministers under the dictation of officers who tell him that they have his successor ready if he is obstinate. The SULTAN feels that he may have some day to depose the Governor who governs in so ineffectual a way. But, in his paternal kindness, he is reluctant to judge and condemn without being quite sure of the facts; and he hopes that there is still time for warning and advice, and that, if good counsel is given and taken, TEWFIK may be saved, and may re-establish his tottering claim to remain in office as a good and worthy Pasha. He accordingly, at a critical moment, sends Commissioners to ascertain exactly what TEWFIK has been doing, to help him in his troubles, and to teach him how to avoid such troubles in the future. If the SULTAN's suzerainty is to be taken seriously, this seems on the face of it by no means improper or extraordinary on the part of the suzerain; and the protecting Powers certainly appeared to take the SULTAN's suzerainty seriously when they invited him to exercise it by deposing ISMAEL. They recognized the

the SULTAN had the power to depose an erring Pasha, and they found in the exercise of this power a swift and easy means of getting rid of a Pasha who had displeased and affronted them. Even if the SULTAN would agree only to exercise his power of deposition on the request or with the assent of England and France, he might still very plausibly say that he must be allowed to examine for himself what is the conduct of a Pasha whom he may be invited or permitted to depose, and to use his timely influence so as to avert the necessity of having to put his latent power in force. What the protecting Powers would probably like is that the SULTAN's authority as suzerain should in ordinary circumstances be non-existent; that he should have no more to do with Egypt than he has with Persia; but that every now and then his authority should flash into a momentary existence at their bidding and for their purposes. It is needless to say that, although diplomatic pressure has been used to give some such character as this to the SULTAN's authority over Egypt, no claim has ever been formulated that this is to be the true and permanent character of his authority; that, on the contrary, the character of the SULTAN's authority in Egypt has been purposely left vague, and that, if France could be justified in making such a claim because of her special interests in Egypt, it is very difficult to see why she should not make the same claim as regards Tripoli.

There seems to be an idea of a very hazy kind, but which floats about in its random manner, that England ought now to do something wonderfully strong and bold in Egypt, to cut herself adrift from France and Europe, and announce that she intends to come forward as the sole and unfettered guardian or owner of Egypt. It is even suggested that the Cabinet has already formed a plan of this sort, and that Mr. GLADSTONE is commissioned to disclose the great secret at Leeds. What the Cabinet may be planning cannot be known until the world is told; but it may be said, without hesitation, that, if the Cabinet has any scheme of the sort, it is entirely departing from the policy which England has pursued towards Egypt and Turkey under a succession of Ministries for half a century. Lord PALMERSTON persistently set himself to oppose the dominating influence of Constantinople to the aspirations of Egyptian ambition when Egyptian and French ambition were synonymous. Lord DERBY brought about the arrangement by which the administration of justice in Egypt was placed under the control, not only of the Great European Powers, but of tiny European Powers which practically have no more interest in the administration of justice in Egypt than they have in the administration of justice in Timbuctoo. Lord DERBY and Lord SALISBURY cheerfully allowed France to share with England the financial control of Egypt when all Europe agreed that some control over Egyptian finance was necessary. When the late Viceroy tried to upset the authority of the protecting Powers, England declined to interfere, although France pressed for interference, and it was not her own policy or the pressure of France, but the sudden intervention of Germany, which made England at last take active steps. What she did when she determined to do something was to appeal, in conjunction with France, to the sovereign authority of Turkey, and the course thus taken met with the ready assent of the other Great Powers. Not only was a precedent thus created, of which the SULTAN is now taking advantage, but a fresh step was taken towards placing Egypt under the guardianship of England and France in the first line, but also under the guardianship of the other Great Powers in the second line. As long as the protecting Powers control Egypt through Turkey they must share their control with all other Powers that can control Turkey. The dependence of Egypt on Turkey means the dependence of Egypt on all the Powers on whom Turkey is dependent. The other Great Powers view with indifference or approbation the control which England and France exercise in Egypt, because through the Egyptian tribunals and through their power of pressure at Constantinople they share this control. Their share is not a very large one, and is of a kind which in ordinary times escapes notice; but it exists, and to ignore its existence, to make some sort of bargain with France, and to treat the other Great Powers and Turkey as having nothing to do with Egypt, would not only be a very hazardous policy on the part of England, but a perfectly new one. That this new policy, the policy of a sudden and violent disruption of the European Concert, should

commit itself to a Ministry that specially piques itself on the good uses to which it has put the European Concert and its invention, seems totally incredible.

England has now the choice between two policies. It may work on the lines laid down by this and preceding Ministries, striving to make the best of things; working with France; consulting, after France, the other Great Powers which have an indirect control over Egypt; not denying the SULTAN's rights, but shaping the actual exercise of his power so as to make it as narrow and harmless as possible; considering with calmness what it is that dissatisfied Egyptians want, and how far their desires can be safely gratified; and only prepared to use force if, in the last resort, force must be used, in a way that has the general approval of Europe. The other policy is to do something bold and original—to seize on Egypt openly or under the disguise of an exclusively English guarantee, and to defy the world. Among other objections to this second policy, it may be observed that it would in all probability tend to defeat its own object. The only object it is supposed to serve is the guarding of British India. We are to take Egypt in order to keep India. It seems an odd way of guarding India to set an example of lawless violence, and to make all Europe our enemy. It is, no doubt, possible that, if England announced its intention of seizing on Egypt, no Power might think it worth while to make the seizure a cause of open and immediate war. Even France might resent and protest, but submit. But the restraining influence of England in Europe as a conciliatory and peaceful Power would be at an end. What we had done in Egypt France might do in Tripoli, Russia in Armenia, or Austria in the Balkan peninsula. We should either have to look on in a quiet and humble frame of mind while others were imitating our example, or we should have to go into a war of our own seeking in order to prove that we could guard our route to India. Apart from initiative acts of spoliation, we should have alienated all the Powers that think they have interests in Europe which ought not to be overlooked. We have been preaching in the last month to the French day after day, and showing them the folly of alighting Spain and Italy by their Tunis expedition. The French would have an opportunity which they would keenly enjoy of sending our sermons back to us, and showing our folly in alienating every Mediterranean Power in order to have a free and open highway through the Mediterranean. As a more matter of gain and loss, apart from the serious questions of principle involved, we should probably do better to rely on our power of sending troops to India in war time round the Cape than to rely on our power of sending them through the Canal in the face of an alarmed and provoked Europe. As things are now, every European Power recognizes that we have interests in Egypt which we must uphold. If we uphold them in such a manner as to command the approval and concurrence of Europe, we really uphold them. If we uphold them so as to shock and alienate other Powers, we destroy the very interests we are seeking to protect.

#### PROGRESS OF AGRARIAN LEGISLATION.

THOSE who foretold that the anomalies of the Irish Land Bill would be speedily converted from exceptional remedies into precedents find their apprehensions justified sooner than they expected. Mr. J. HOWARD and his associates in the Farmers' Alliance have already drafted a Bill for the arbitrary transfer of a large part of the property of landowners to themselves or the tenant-farmers whom they profess to represent. It may be confidently asserted that a more audacious project was never submitted to a Legislature; but it is impossible to estimate the injustice of which the present Government and its obedient majority may be capable. Before the text of the Bill was published, for the apparent purpose of accustoming public opinion to novel and unscrupulous demands, the governing body of the Alliance published a sketch of the proposed Bill in the congenial and sympathetic columns of the *Standard*. The writer, who performed his task without the smallest attempt to disguise the purposes of his clients, apparently belonged to the Birmingham section of the staff of the paper. It seemed

probable that one of his Conservative colleagues would afterwards be instructed to examine the new agrarian project of law. The expectation was justified by an article on the Bill itself, which was a model of apology or approval under a pretence of adverse criticism. The compiler of the previous abstract executed his task with accurate fidelity. His insinuated vindication of its provisions probably represents the arguments which will be used by the promoters. As he calmly and truly states, the Bill will "virtually grant the three F's, without actually mentioning them." "A farm will" (from the point of view of "the Alliance") "become a 'subject,' in which two persons, 'owner and occupier, have joint, but not equal, rights of property; and the question is, how these rights are to be differentiated." The land-owner may be well assured that, if the doctrines of the Farmers' Alliance prevail, any residue of his rights which he may for the present be nominally allowed to retain will, by further abuse of political power, soon be differentiated away. By the proposed Bill the differentiation will be effected after the model of the Irish Land Bill on principles which the Farmers' Alliance borrows from the Irish Land League. In due time, perhaps, a Taxpayers' Alliance will propose to convert the Funds into a subject in which two persons, taxpayer and fundholder, have a joint but not an equal, right of property. Debtors of all classes will be equally willing to enter on a process of differentiation with their creditors.

The three F's, if they are not mentioned, are introduced without any attempt at concealment. The framers of the Bill are kind enough to allow existing contracts to remain in force, as long as neither party desires an alteration; but a landlord who wishes to raise the rent may apply, and the tenant who wishes to lower the rent will apply, to a Land Court which is as completely as in Ireland to supersede all freedom of contract. There is something which may be called impudent in the suggested constitution of the body which is to differentiate the property of the landlord into the pocket of the tenant. It is true that the County Court judge who is to preside will probably wish to do justice, though he will have no definite or intelligible law to administer; but the most important part of his duty will consist in valuation of land and improvements; and his probable incompetence to assume the functions of a land surveyor will place him in the hands of the assessors who are to be appointed by the Board of Guardians, or, in other words, by the tenant-farmers. The judges at whose mercy the whole landed property of the kingdom is to be placed will probably be selected on account of their well-known bias against the rights of landlords. Mr. HOWARD and his friends are unconscious of the contemptuous estimate which their proposals involve of the honesty and wisdom of the Ministers whose support they hope to purchase by their votes.

To divide property between the undoubted owner and an intruder under the arbitration of a tribunal representing the new claimant is a wanton defiance of justice and decency which would two or three years ago have been deemed inconceivable. The other provisions of the Bill are worthy of the machinery by which it is to be administered. The tenant who receives notice to quit after the rent has been fixed by the Land Court may put up his interest for sale in the open market, and compel the landlord either to accept the purchaser as tenant or to pay the outgoing tenant the price which has been offered. As no part of the measure is even ostensibly consistent with justice or economic principle, it is perhaps useless to remark that a new tenant-right would imply that the Land Court has fixed the rent too low. The present occupier paid no premium on coming in; and he demands a premium on going out, for no reason except that many farmers voted for Mr. GLADSTONE at the last election. The enactment of any portion of the Bill would be an act of bribery as gross as any distribution of sovereigns which has been made by the Man in the Moon. The exponent and eulogist of the Bill who writes in the *Standard* declares that the proposed tenant-right "for the first time puts the vexed question of 'improvements upon a logical and commercial basis.'"

Having assumed that there is no need to trouble Ministers about any question but the promotion of the interests of tenant-farmers, the managers of the Alliance proceed to disport themselves at will in all other relations between landlord and tenant. All contracts made in violation of the principles of the Bill are to be rendered null and void. "All forfeitures on the ground of breach of cove-

nant will also in all likelihood be ignored." "All conditions as to the nature and succession of crops are 'virtually abolished.'" An occupier for two or three years will be able to break up old meadow land of which the qualities could not be reproduced in a single lifetime, with the sole risk of incurring liability to a payment to be assessed by two neighbouring farmers, engaged perhaps in a similar operation. "The tithe-charges will in all probability be placed on the same footing as house duty at present, the tenant paying them in the first instance, and then deducting them from the rent." The Committee of the Alliance probably chuckle over the reflection that the amount of tithe rent-charge has, in ordinary practice, been already deducted from the rent, as one of the considerations in the contract of letting. The mode in which the Bill deals with the question of rates may be inferred from its general provisions. "The Committee engaged in revising the draft of the Bill have, we learn, agreed that only one-fourth of the local rates levied on farm land shall be paid 'by the tenant.'" It may be asked why, in appropriating to themselves the goods of their neighbours, the tenant-farmers should restrict themselves to three-fourths of the whole. Some agrarian REGAN will probably outbid the GENERAL of Bedford by proposing to lay all the rates on the landlord, whose rent has already been reduced by the full amount. The tenant-farmers as represented by the Guardians will have the pleasure of expending the rates of which the unhappy owners are to pay three-fourths. The instinct of predatory selfishness acquires strength as it moves.

What needs he five-and-twenty, ten, or five?

Although arguments addressed to those who avowedly legislate for their own exclusive benefit are likely to be wasted, some considerations of prudence and self-interest may be worth the consideration of farmers who are disposed to join the Alliance in the hope of sharing the profits of spoliation. Mr. GLADSTONE, on whom the hopes of the Alliance are fixed, has already paid them a part of the price of their votes in the Ground Game Bill of last year. He would perhaps be willing to grant them a further boon at the expense of perverse Tory landlords; but they are not the only claimants on his bounty. Before it was thought possible to purchase the support of the farmers, the party now dominant had promised to enfranchise the labourers, in the well-founded hope of ensuring their political support. Household suffrage in counties will almost certainly be enacted by the present Parliament, and at the next election the new constituencies will show their gratitude to their benefactors, but not without a distinct expectation of future favours. The demands of the labourers will, from the nature of the case, be almost exclusively directed against the farmers. The Land Court may furnish a precedent for a Wages Court, which would exercise a not more anomalous jurisdiction. A Nine Hours Bill might also find a chance of acceptance if it were supported by a sufficient number of county votes. The institution of a peasant proprietary, though it might be more remote, would put an end not only to the Alliance, but to the farmers who compose it. The only mode of encountering dangerous schemes of innovation is to abide by sound principles of law and economy. If property is to depend on a majority of votes, the large farmers will soon be swept away. They already propose, for the benefit of the present occupiers, to subject all future tenants to an extreme rack-rent by compelling them to purchase the tenant-right at a price to be fixed by competition. The labourers, when they attain political power, will scarcely respect the newly acquired rights of a middle-class oligarchy of irremovable occupiers. It will, indeed, be difficult to defend a one-sided fixity of tenure, while the tenant retains the right, which he now frequently exercises, of throwing up his farm at pleasure.

#### TINKERING THE HOUSE OF LORDS.

AN article on the House of Lords in the *Fortnightly Review* painfully illustrates the unstable condition of all English institutions. That a periodical of revolutionary tendencies should contain an attack on that part of the established system which is most obnoxious to zealous democrats would cause no surprise; but Mr. RATHBONE, the author of the present essay, is a temperate advocate of changes which he would willingly restrain within safe

and reasonable limits. His objections to the House of Lords, as it now exists, are not founded on social jealousy; nor is he disposed to do injustice to the great qualities of many members of the hereditary aristocracy. He believes that rank and wealth may still advantageously be used to strengthen an efficient Second Chamber; but he thinks that the House of Lords ought to derive its authority from election, while he admits that there may be a reasonable difference of opinion as to the constituencies to be created for the purpose. A feeling of regret that a proposal for abolishing the present House of Lords should proceed from such a quarter indicates no want of respect for Mr. RATHBONE's ability and character. Plausible and even forcible arguments may be used against almost every branch of the ancient Constitution, including the highest summit, which is not yet included in the plan of revolutionary advance. The doctrine which is more than once propounded by Mr. RATHBONE, that in the present day every institution must justify itself by its practical utility, would perhaps be sound if it were universally applied. To some minds it seems that one gigantic exception practically vitiates the rule. Those who regard the absolute supremacy of numbers as the greatest of anomalies are quite certain that it rests, not on any calculation of expediency, but on physical force. The only power by which it can be even practically counterbalanced is respect for tradition, or the habit of acquiescing in the existing results of historical causes. Democracy, which questions all other authority, never examines its own credentials. In a sentence which is composed for another purpose, Mr. RATHBONE casually justifies the existence of the House of Lords. The leisured class is, as he justly says, the informal constituency of a Second Chamber. He might have added that in a short time the leisured class will be represented in no other assembly. It is already disfranchised in France, and to a great extent even in the far more healthy political organization of the United States. In neither country is property so seriously threatened as it has been of late in the United Kingdom. The House of Lords may perhaps not be strong enough to stem the tide of revolution; but its power of resistance may probably be greater than that of any substitute which could be contrived.

Mr. RATHBONE is thoroughly sincere in his desire to strengthen a House of Lords, under that or some other name, for the discharge of functions which he holds to be of paramount importance. He oddly illustrates the necessity of such a barrier to improvident legislation by "the working of American politics during the last forty years." He truly says that "the need of conciliating compact and selfish minorities made it hard, at one time almost impossible, for an honest man to be a politician." He adds that the same cause made possible a growth of local taxation almost equivalent (as in the city of New York) to confiscation. In the United States there is, as Mr. RATHBONE elsewhere observes, the most powerful Second Chamber which anywhere exists. Even in TWEED's Irish Republic of New York the Board of Aldermen revised the decisions of the predatory Town Council. The want of a check on dishonesty and wrongful legislation was produced by the common origin of all powers in the Federation, the State, and the Municipality. The same constituency directly or indirectly elected them all; and the class which possessed property and leisure was represented by no House of Lords. It is true that in England the hereditary branch of the Legislature has many imperfections; but it was hardly worth Mr. RATHBONE's while to quote, in support of his own more valuable opinion, the supposed admissions of a writer "whom we cannot suppose prejudiced against that House of which he will one day be a member." There have always been aristocrats who, through caprice or love of notoriety, affected hostility to their own order. In quiet times such patriots make the best of both worlds by combining the advantages of rank with the favour which may be earned by the profession of popular opinions. The Liberal nobles of the French Revolution were destined to acquire an opposite experience, which may be profitably studied by their successors in other countries.

Mr. RATHBONE, though he is free from conscious unfairness, scarcely does justice to the mode in which the House of Lords conducts important business. Mr. FREDERIC HARRISON, who is certainly not more friendly to the House of Lords than Mr. RATHBONE, lately cited the debates on the Irish Land Bill as models of method, if not of sub-

stance. Mr. RATHBONE, on the other hand, thinks that the Peers by their attitude seemed to court destruction. They were, by no fault of their own, placed in a difficult and awkward position. Their duty to themselves and the country forbade the rejection of the Bill; and yet it was proper and necessary that they should record their objections to its principle. Lord LANSDOWNE's speech, which was perhaps the best delivered on the occasion, contained a conclusive exposure of the political and economic faults of the measure. In a concluding paragraph he intimated that the evils of rejection would nevertheless be greater than those which could result from acceptance of the Bill. The Ministers, and not the Opposition, were responsible for making offers which were in their nature incapable of retraction or of reduction. Mr. HARRISON praised the rapidity with which the House of Lords elaborates details in Committee. Mr. RATHBONE finds much fault with the alleged ignorance of details, which he attributes to want of contact with constituents. It is true that the great body of the Peers may not possess extraordinary legislative aptitude; but in no other assembly is business so habitually left in the hands of the leaders of parties.

Mr. RATHBONE's scheme of reform is perhaps as good as any rival plan for the constitution of a new Second Chamber. He would make all peers eligible for a seat; but he proposes that the House of Commons should, by cumulative vote, elect one-third of the Upper House for periods of fifteen years. The election would really devolve on the Ministers of the day, who are also to have the power of appointing a limited number of civil and military servants of the Crown. The Law Lords are to retain their present seats, and the total number of three hundred is to be completed by the addition of the Chairmen of the proposed County Boards. As the Boards themselves will be elected by household suffrage, it is not impossible that some of the Chairmen may be local agitators, possessing influence in their own districts, but wholly unqualified for seats in the House of Lords. It was thought rash on the part of a religious Order to embody a condemnation of all change in the well-known formula—*Sint ut sunt, aut non sint*. To the House of Lords the phrase may be applied in the form, not of a wish, but of a prophecy—*Erunt ut sunt, aut non erunt*. It is strange that Mr. RATHBONE should regard the constitution of the American Senate as a precedent for the election of a part of the Second Chamber by the House of Commons. The Senate would have been as commonplace as the House of Representatives if it had been elected by that body; but it is useless to criticize in detail a project which is only one of many plausible contrivances which might be suggested. The French Senate furnishes an instructive example of the difficulty of creating a Second Chamber under the conditions imposed by modern democracy. It is elected by three or four different methods; it includes many of the most eminent orators, of the soundest economists, of the most experienced statesmen and administrators of France; and yet when it lately rejected a Bill of secondary importance, an outcry was immediately raised for its abolition; and M. GAMBETTA, who at first defended its independence, now thinks it convenient to support some scheme of reconstruction which may ensure its absolute subservience to the more popular assembly. Mr. RATHBONE's just and eloquent eulogy on the members of one great patrician House might serve as an argument for maintaining the privileges which he proposes to destroy or to qualify. The social and political weight of an able and wealthy family derives its principal lustre from the presence of its chief in the hereditary Assembly, which in turn is largely dependent on the general respect which is felt for himself and his equals.

#### LORD DERBY ON THE IRISH LAND ACT.

LORD DERBY has set himself to examine calmly and candidly the probable effects of the Irish Land Bill now that it has become law, and no one can aid or prevent its passing by exaggerated hopes or fears. What does it all come to? What will it do? What will it not do? are the questions which Lord DERBY attempts to answer by the light of a clear, cold judgment and of much experience of affairs, general and Irish. He necessarily assumes, to begin with, that the Act will be allowed to work, that the decrees of the Court will be respected, and that the law will in practice give to every man what it gives him in theory. If this is assumed, Lord DERBY shows that the

landlord will lose very little. On the whole, the land is let at a low rent. A fair Court, therefore, if it does not raise rents, will not lower them; and, as it is assumed that in the future all legal obligations are to be punctually fulfilled, the mass of landlords will get the same rents paid as a matter of certainty that they now get in a very precarious and painful way. They will have no political power, but they have already lost under the Ballot the political power they once possessed; they will retain the social advantages which in a peaceful country always attach to the receipt of large revenues from a source so obvious and indisputable as land. Their incomes will indeed be larger than ever, for they will no longer be exposed to the importunities of tenants asking them to contribute towards improvements. They retain all their rights of sport, and, under this imaginary reign of law, no one will poison hounds or stop hunting with pitchforks. Their only real loss will be that of the pleasure of finding a sphere of honourable activity in the personal management of a large estate, and it is not a pleasure that the bulk of Irish landlords have had the wish or the resources to enjoy in any very great extent. There will, no doubt, be landlords who will have their rents and their incomes reduced, and who therefore will have to content themselves with the thought that a certainty of sixpence is better than the chance of a shilling. Speaking broadly, Lord DERBY is quite right in saying that the landlords would not lose if the Act was loyally carried out. He, indeed, somewhat understates his case. If we are to contrast the dismal anarchy that prevails in Ireland at present with an imaginary state of things in which every one obeyed the law, the landlord got his present rents paid to the day, enjoyed in peace his social distinction, and sported to his heart's content, he ought, if he had a spark of gratitude, to invoke blessings every evening on the heads of those good and clever men who thought of this wonderful Act which had conferred on him such inestimable benefits.

When Lord DERBY turns to the tenants he sees before him a much more gloomy prospect. The tenants are now, he says, in the position of peasant proprietors who have not paid for their land. Are they likely to thrive in such a position? Lord DERBY thinks they are not for several reasons, of which the chief are that the soil and climate of Ireland are not favourable to small farms; that the tenants will have no capital to make improvements; that the Irish farmers have a painfully slight knowledge of their business; and that they are apt to have inconveniently large families. The many would fail, and only the few would succeed. Those who failed would sell their holdings, and the purchasers would be those who thrive. Lord DERBY rightly calculates that as a pure matter of business the cultivator of an adjacent holding is the man who can afford to give the best price for the interest of an outgoing tenant. Thus in the long run the effect of the Act would be to consolidate farms, and although this would be in one way a public benefit, for the soil would produce, if Lord DERBY is right, more than it can produce under a system of small farms, all the objects which have prompted the agitation by which the Act has been gained would be defeated. It is impossible as to all this to say whether Lord DERBY is right or wrong. We are told to assume the existence of a state of things so unlike all that we see now, that we cannot realize its immediate, and still less its remoter, consequences. It is supposed that the soil is to be occupied by tenants sure of their holdings, and in return cheerfully obeying the law, rigidly fulfilling their obligations, and making a gallant and persistent effort to do their very best with the land on which they find themselves placed. If humble Irishmen are capable of undergoing this moral transformation, they might also be capable of doing more in their new and better state than Lord DERBY expects. If we are to look at the mass of landlords and omit exceptional cases, we ought also to look at the mass of tenants. There are Irish tenants who, if they had no other source of livelihood, could not in most years pay any rent at all. But the mass of Irish tenants are perfectly well able to pay their rents if they choose. The proof of this is that, according not only to Lord DERBY but also to the best authorities he has been able to consult, on every two Irish estates out of three the rent has not been raised within the last twelve or fifteen years, and the rent, until the present agitation began, was regularly paid. This is, in fact, the customary rent which Lord DERBY thinks the Court will impose as

the future rent, and which it is assumed will be paid when due by a law-abiding tenant. What is there in the Land Act to make it more difficult for the tenant to live and pay this rent than it has been hitherto? These men, with a new moral nature, will find themselves in a new position, and this position will, at any rate, make them more, and not less, prone to do their very best for themselves and the land. As owners subject to a quit rent, they are not likely to work less hard or to take less interest in their work than they used to do when they held by a tenure which they believed, or affected to believe, was precarious. The size of their families might make emigration necessary; but these worthy, law-abiding, industrious men would be just the persons to explain to the superfluous members of their circle that they would do better to leave home and shift for themselves. They would, as Lord DERBY observes, have no capital for such expensive improvements as draining; but draining has hitherto been mainly done not with the money of the landlords, but with money which the landlords have borrowed; and tenants who as a body obeyed the law and paid their rents would borrow for drainage as easily as the landlords have done. There is perhaps only one way in which the Land Act is prejudicial to the tenants. Foreign competition may lower the price of the main articles of Irish produce. In this case it would be disadvantageous to a tenant to be saddled during a statutory term with a rent based on prices when foreign competition was not felt, and in this respect the rigidity of the Act would tell too much in favour of the landlords.

After discussing the probable effects of the Act as it would operate if a reign of law, order, and general content were established, Lord DERBY handles the very serious preliminary question whether there is any solid reason to anticipate that this happy state of things will be seen by the present generation. In other words, will the Land Act pacify Ireland? Lord DERBY has no kind of hesitation in saying that it will not. Whether it will ever come into practical operation until those who are determined that it shall not have a chance are made to feel themselves in danger is very doubtful. But, apart from this, there is the very grave objection to all hopes of the pacificatory effects of the Land Act, that it is not what England has given, but what England will not give, that the Irish want. Lord DERBY has done his best to inform himself on this head, and all that he has seen, read, or heard, leads him to the conclusion that the bulk of the Irish will be pacified by nothing but separation from England. Their new moral nature is not going to begin to show itself until they are allowed to set up a government for themselves. As Lord DERBY pointedly says, we are at the commencement, not at the end, of a great struggle. Nothing can be more unwise than to underrate the gravity of the position in which England is thus placed. Whatever we do, we seem only to increase the anxiety of the Irish to be let go. If we humour them, and pass an Act like the Land Act, which we only justify on the ground that they are not as we are, they take this as a confession that there are inherent differences which make an enforced union odious to them. If we treat them as being like Englishmen, and give them juries and the Ballot, a democratic franchise and local government, they use these gifts as instruments for working out their end of separation. Prudence, patience, and great firmness may overcome the Irish difficulty, as they have overcome so many difficulties which English statesmen have had to encounter; but they were never more necessary, and nothing can be more illusory than the hope that we have suddenly found in the Land Act a sovereign and specific remedy for the political maladies of Ireland.

#### M. FERRY AND M. GAMBETTA.

THAT small portion of the French public which takes an active interest in politics is busy in speculating as to the precise date and the immediate antecedents of M. FERRY's impending resignation. That the nominal leader of the lately-elected majority is shortly to make way for a new Prime Minister no one, except the Paris Correspondent of the *Times*, seems to doubt. The only point about his retirement from his present office which is still uncertain is whether it will come before or after the meeting of the Chambers. If the question

were to be decided either by precedent or political propriety, M. FERRY would certainly choose the latter course. He might very naturally have ceased to be Prime Minister six weeks ago, because he could then have said that, as the new majority evidently belonged to another man, he should no longer profess to represent it. Instead of this, he claimed the new majority as his own, and gave no hint that the thought of resignation had so much as entered his mind. No fresh light has been cast upon the composition or wishes of the new majority since that time, and if M. FERRY now resigns without waiting for the meeting of the Chambers, he will find a very different explanation given of the step. He will be accused, and accused with much apparent reason, of desiring to escape the responsibility of the war in Tunis. Had things gone well there, it will be said, nothing would have been heard about a Ministerial reconstruction until the Chambers were again in Session. This sudden desire to leave M. GRÉVY free to send for whomsoever he chooses coincides somewhat suspiciously with the news that has lately been received from North Africa. It will be taken, at all events, to mean that M. FERRY is anxious to escape the responsibility of his own action, that he has sacrificed the Tunis expedition to considerations of political convenience, and that he does not wish to face the censure which he is certain to incur in consequence. A Minister who retires under these circumstances must be curiously indifferent to the good opinion of his countrymen. To resign office rather than challenge, or even endure, inquiry is to admit that your motives will not stand examination. If M. FERRY has anything of a case, he will naturally be anxious to lay it before the Chamber, and he can only do this to advantage by remaining Prime Minister until there has been time for his conduct to be debated. M. GRÉVY, who is understood to be scrupulous about Parliamentary proprieties, can hardly fail to take this view. Though the powers of the President of the Republic as regards the selection of Ministers are not very well ascertained, he will certainly assume that a Chamber which is so nearly a double of the old one must be held to support the Cabinet which the old Chamber supported, until it has given evidence to the contrary.

When constitutional propriety and the wishes of the Chief of the State point unmistakably to M. FERRY's retention of office until he has been displaced by a Parliamentary vote, it may seem strange that there should be so much as a suspicion that he means to anticipate such a vote by resignation. Even a Prime Minister has a right to be accounted innocent until the contrary is proved; why, then, should it be taken for granted that M. FERRY means virtually to confess his guilt by running away from trial? That is a question for French journalists to answer; all that foreign observers can do is to note the fact that this intention on the part of M. FERRY is taken for granted by many persons who profess to be well informed as to his intentions. The very day on which he is to place his office at M. GRÉVY's disposal is named, and a reason assigned why he should do it on that day and on no other. It is argued that the new Prime Minister will wish to meet Parliament as soon as his Cabinet is formed, lest some mischief in the way of intrigue should be found for the hands of idle deputies, and it is calculated that it will take about ten days to form the Cabinet. This explanation of M. FERRY's expected resignation has the fault that it only explains why it should take place at a particular time. In this limited sense it is certainly an adequate explanation. Given that M. FERRY has determined not to face the Chambers in his present office, there are good reasons why he should retire from it somewhere between the 15th and the 18th of the present month. But it leaves the question why he should retire from it at all just where it was; and before this can be answered, it must be made clear why M. GAMBETTA wishes to take office before the meeting of the Chambers rather than after. If he had not made up his mind that the time is come for him to step into M. FERRY's shoes, we may be sure that M. FERRY would not be so anxious to put his shoes off. Now there are at least two reasons why M. GAMBETTA should not wish any longer to delay taking office. The first is, that if he is in power when the decisive news comes from Tunis, he will come in for the credit of it if it is good, while he will be able to wash his hands of it if it is bad. No one can say precisely how far M. GAMBETTA has shared in the responsibility of the expedition; and since it is left to him to define his part in it, he will probably be guided by the consider-

ation whether this responsibility is glorious or inglorious. If he waits until the result is known, he runs the risk of that result being favourable, and so of M. FERRY's seeming to be thrown aside, not because he is not fit to be Prime Minister, but because M. GAMBETTA wants to be Prime Minister himself. The second reason is that, if M. FERRY's resignation is postponed until after his policy has been debated in the Chamber of Deputies, M. GAMBETTA can hardly avoid taking part in the discussion. The politician who by universal consent is to succeed the Minister whose conduct is under inquiry must give his own opinion of that conduct, and state in what respects he would have acted differently. It is easy to see why M. GAMBETTA should wish to escape this necessity. No one except himself and some members of the present Cabinet can say how far the conduct of the Tunis expedition was of his ordering, and how far of M. FERRY's. So long as there is no exhaustive debate in the Chamber the precise distribution of parts may remain unknown, and if a new Cabinet is formed before the opening of the Session an exhaustive debate may be avoided. There is very little amusement in censuring a Government which no longer exists, and it will not be possible to censure the new Government until there has been time for it to show how its policy differs from that of its predecessor.

This, however, only accounts for M. GAMBETTA's anxiety that M. FERRY should not wait to defend himself before the Chamber. What can be the motive which is expected to lead M. FERRY to the same conclusion? He, it might be thought, is under the strongest possible inducements not to evade a Parliamentary trial. Even if all the charges now current against him should be proved in every detail, he would still be better off than if he resigned in order to prevent them from being proved. In the former case he would at least have given evidence of courage, if not of statesmanship; in the latter case he would have shown himself equally deficient in both qualities. This is not the view which is taken of the situation by French politicians. They, strange to say, are of opinion that M. FERRY will better, rather than injure, his prospects by declining to answer his accusers. If, it is said, he retires from office before the Chamber meets, there will be nothing to prevent M. GAMBETTA from offering him a seat in the new Cabinet. If, on the other hand, he awaits a vote of want of confidence, and the division goes against him, M. GAMBETTA will not be able to do this. For the time, at all events, a vote of censure directed against a Ministry must be accepted as disqualifying its chief for holding office in the Ministry which follows. M. FERRY may serve under M. GAMBETTA if he runs away from a Parliamentary condemnation, but he cannot serve under him—at least, not immediately—if he remains to face a Parliamentary condemnation. As ex-Ministers are very quickly forgotten in France, M. FERRY probably thinks that it is safer not to let the chance go by. The part assigned to him in the transaction argues a low standard of political honour; but, inasmuch as no considerable organ of French opinion seems to reject the hypothesis, it must be supposed that it is a standard in which average French opinion sees nothing discreditable.

#### LORD O'HAGAN AT DUBLIN.

THE Social Science Association has for some time past become dull and useful. In its early years it was neither. The extravagances which found their natural place at its meetings yielded an annual crop of amusement, and even the enthusiasts who paraded them did not dream that the experiments they suggested would ever be seriously tried. Now, the Congresses mostly address themselves to points in which the law is admitted to need amendment, and the President's address bears a painfully close resemblance to a Queen's Speech. Lord O'HAGAN's survey of the field which the Association has made its own was fair and comprehensive. He avoided awkward questions with all the care which high office renders necessary, and contrived to fill his allotted space without betraying any sense of the irony of fortune in placing a meeting called together to consider amendments of the law in a country in which law has ceased to be of any account. It is doubtful, however, whether under any circumstances a conspicuous party politician can be a good President of a Social Science Congress. He is bound by his posi-

tion not to hint that anything for which his colleagues, past or present, are responsible is other than perfect; and, however convinced he may be of the need for further changes, he must not betray his conviction in words. Lord O'HAGAN moved as easily under these fetters as it is possible for any one to do, but the fetters were still there. They were especially visible in the parts of his address which bore upon education. Lord O'HAGAN is an Irishman and a Roman Catholic, and in neither character can he feel any genuine liking either for the Intermediate Education Act or for the foundation of the Royal University. Religious prejudices in one political party and irreligious prejudices in the other have combined to withhold from Irishmen the kind of education which the majority of the nation desires. Conservatives have disliked the notion of endowing Popery; Liberals have disliked the notion of endowing any creed whatever. The consequence has been that secondary and university education have hardly existed for Irish Roman Catholics. Trinity College and the Queen's Colleges have been frequented mainly by Irish Protestants. The object of the Intermediate Education Act and of the Royal University is to amend this state of things in fact, without amending it in form. Party exigencies have made it impossible, or have been supposed to make it impossible, to give Roman Catholic parents in Ireland the same advantages which have long been enjoyed by Anglican parents in England and by Presbyterian parents in Scotland. In the two latter cases the desire to bring up their children in their own religion has been esteemed a virtue; in the former it has been treated merely as a proof that those who profess to feel it set no genuine value on education. Perhaps if leading politicians on both sides had had the courage to paint this flagrant inconsistency in its true colours, Englishmen might by degrees have awaked to it; but, instead of this, leading politicians on both sides have agreed to support one another in making believe that Irish education must be regulated by one principle, and English and Scotch education by another. The Intermediate Education Act and the Royal University are attempts made, so to say, under the rose to give Irish Roman Catholic youths an education which their parents' consciences will allow them to accept for their sons. The State carefully shuts its eyes to the destination of the money which it pays for this purpose. It refuses to know anything about the religion of the youths to whom it gives scholarships and fellowships; it only knows that they have passed a given examination. This is, no doubt, a great improvement on the system under which Roman Catholics could not hold scholarships or fellowships even by passing an examination. But it is open to objections which no one is better qualified than Lord O'HAGAN to set out with all the just weight that belongs to them. If he were not, never had been, and never hoped to be, in office, the Social Science Congress would have been greatly the gainer.

It is natural that the author of the existing Irish jury system should think well of his own work, and that a considerable part of Lord O'HAGAN's address should have been devoted to a defence of the Act which he passed in 1871. It is fair to remember that the deserved discredit into which trial by jury in Ireland has lately fallen has nothing to do with any particular method of choosing juries. It is useless to try to combine incompatible advantages. There are merits in trial by jury, there are merits in trial without a jury; but the merits are not identical. The virtue of trial by jury is the popular satisfaction with the result of the trial which springs from the popular character of the body by which the verdict has been given. The virtue of trial without jury is the possibility which it affords of obtaining a really capable and instructed tribunal. Great fault has been found with the Jury Act of 1871 because it took away from the sheriff the power of selection, and made the payment of rates a sufficient qualification for a juror. There are times, no doubt, when these two changes will almost necessarily work badly. There might be some chance of getting a just verdict, even in an agrarian case, if a high qualification had kept out most of the class which is actuated by passion or fear, and if the sheriff had kept out the remainder. It would be far better, however, to suspend trial by jury altogether than to deprive it beforehand of the features which constitute its sole claim to public confidence. A condemnation by a Special Commission would not excite a tenth part of the sympathy for the criminal which would be excited by a condemnation by a packed jury, or even

by a jury from which every one of the same rank with the criminal had been rigidly excluded. When the popular feeling about crime is healthy, the verdict of a jury will seldom do any real injustice. When the popular feeling about crime is unhealthy, trial by jury has ceased for the time to be a satisfactory or proper method of arriving at the truth. What Ireland wants at the present moment is, not any tinkering with the method by which juries are chosen, but a frank recognition of the fact that no method of choosing juries can be satisfactory in agrarian cases which does not make them cease to be juries except in name. When things have come to this pass, the remedy is to be sought in a suspension of trial by jury until it has once more become possible for juries that are juries in something else than in name to be trusted with the trial of prisoners charged with agrarian crimes. It is not to be expected that the meeting at Dublin will give a very certain sound upon a question of this kind. In theory, every Irishman must be assumed to wish that a man who has shot a landlord, resisted the police, or taken violent possession of land to which he has ceased to have any title should have prompt punishment meted out to him. In practice, the sympathy entertained for the cause to which these acts are supposed to minister makes a difference in the feeling with which the execution of the law is regarded, and this distinction may be expected to be visible even in a Social Science Congress.

It is inevitable, perhaps, that at a Social Science Congress held in Dublin something should be said in behalf of the movement which is to give Ireland manufactures. But Lord O'HAGAN would have done a greater service to his countrymen if he had warned them that such a movement is predestined to failure. There are countries in which the question whether manufactures shall or shall not exist on a great scale is determined by legislation; there are others in which it is determined by nature. Ireland belongs to the latter class, and a greater injury could hardly be done her than to invite capital to work up imported raw material with imported coal and imported machinery.

#### COVENTRY.

THANKS to Lady Godiva, the city of Coventry is more generally known than most provincial towns of the same degree of importance. The knowledge of it possessed by most people is, however, probably confined to the legend of Earl Leofric's lady, and the form of Boycotting known as sending the victim to Coventry, together with some vague ideas about seven spires and an accompanying multiplicity of churches. To such persons it may perhaps be disappointing to know that only three spires are now standing, that the legend of Godiva is probably quite mythical, being mentioned by no authority earlier than Matthew of Westminster, and that the episode of Peeping Tom—

low churl, compact of thankless earth,  
The fatal byword of all years to come—

is a late addition to the legend. In spite, however, of the destruction of ancient monuments which has been wrought by time, "restoration" and the necessities of trade and manufacture, Coventry still possesses much that is of the highest interest to antiquaries and students of architecture. Beside the three beautiful churches, and St. Mary's Hall, one of the finest guildhalls in existence, the city is rich in examples of domestic architecture of the best periods, especially of the early part of the sixteenth century. The town is fortunate, too, in its situation. The country near, especially to the south, in the direction of Warwick and Stoneleigh, is perhaps the loveliest in the county. On the Stoneleigh road, a mile or so from the city, lies Stivichall, with its beautiful grange, and the little church built in forty years by one man's labour. The road to Warwick, with its avenue of oaks, its grassy rides, and the stretches of fern-clad common by the wayside, is conspicuous, even among Warwickshire roads, for its beauty. As one approaches Coventry by this road, the two tall spires which stand on high ground in the middle of the town form a landmark for miles, except where the view is hidden by the elms that meet overhead. The entrance to the town on this side is very fine, in spite of some ugly modern buildings. Most of the houses are roofed with red tiles, and the two spires, prominent in every view of the town, rise over the cluster of low buildings which intervenes, with no rival object to take away from their appearance of immense height. Leaving behind the station and the row of stuccoed villas with which modern taste has disfigured the approach to it, we pass the old house where George Eliot went to school, and the little inn where the figure of Peeping Tom looks down from a window at the street-corner. In some parts of the town the old stands side by side with the new. A tumble-down timbered house leans against a magnificent new gin-palace, fragments of the city wall are placarded with the advertisements of bicycle manufacturers, and a fireplace lined with rare Dutch tiles

accompanies hair-brushing by machinery in a barber's shop. Elsewhere there are whole streets which still retain their old-world appearance. The houses are of all heights, their roofs pitched high or low according to the builder's fancy. They stand at various angles with each other and with the line of the road, and encroach upon the footpath in a way calculated to vex the souls of municipal authorities. The beams and gables are often enriched with fine carving, and many have suffered little except in the mutilation of the finials, which has been so general that in some modern reproductions of the style the finials have been copied in their mutilated form, and instead of rising above the apex of the gable, have been cut short and covered with coping tiles. One of the most picturesque of the old streets is Butcher Row, which stands close to the churches and in suggestive proximity to the old Bull-ring. Here the houses seem to be tumbling about in all directions, and are kept together in defiance of the laws of gravity by the strength of the materials and the excellence of the workmanship. In a narrow lane which leads into Cross Cheaping the buildings on each side slope so much as almost to meet overhead, and remind one forcibly of a street in the Arab quarter of Cairo, where "tres pateat coeli spatium, non amplius, ulnas." The line of the city walls can be easily traced in many parts, especially on the south side, where the city has never passed beyond its ancient limits. Here a footpath skirts the boundary line, and rows of cottages, raised above the foundations of the wall, look southward over acres of garden and orchard. Most of the gates have disappeared, but one remains on the north-east at the end of Cook Street, and the gate-house of another is still inhabited. A fine gateway which once belonged to the monastery of the White Friars still leads from the lane called after them into Much Park Street.

Of course the interest of the town centres around the churches of St. Michael and Trinity, which are too well known to need any detailed description. The beautiful red sandstone of which the tower and spire of St. Michael's are built adds the charm of colour to that of form, and the crumbling of the stone has given the beauty of age without as yet endangering the safety of the structure. Of the ruins of the Cathedral and Priory to the north of the two churches very little remains. Some foundations have been excavated and exposed to view in front of the buildings of the Blue Coat School, and a fragment of wall has been cleverly built into the new fabric, instead of being ruthlessly pulled down to make way for it, as usually happens in such cases. A great part of the site of the Priory is now occupied by a row of large red brick houses, built for the most part in the early part of last century, when Coventry, after a century and a half of depression, was beginning to recover through the introduction of the silk trade. No doubt further excavations would bring to light many interesting remains which lie buried beneath the trim lawns sloping down from the back of these houses. St. Mary's Hall stands on the south side of St. Michael's Church. Its history is closely connected with that of the city guilds, which were founded mainly in the reigns of Edward III. and Richard II. The hall was first built about the middle of the fourteenth century, by the guild from which it takes its name. As it now stands, it dates from the close of the same century, when the more important guilds were united. Though the Trinity Guild gave its name to the new society, the hall, after the rebuilding, retained its original title. It is fully described in Sharp's *Antiquities of Coventry*. Among its most interesting contents is the famous tapestry which has lately been exhibited at South Kensington. It hangs under the north window, and illustrates the close connexion between the city and Henry VI., who was a member of the Trinity Guild. The tapestry is in a state of excellent preservation; but it is unfortunate that the excessive zeal of the Reformers should have led them to cut out the representation of God the Father which originally occupied the centre of the chief compartment, and to substitute the present poor figure of Justice. The hall contains portraits of the English sovereigns from Elizabeth to George IV.; but perhaps the most interesting picture of all is one which may with great probability be ascribed to Sir Antonio More. It has generally, but no doubt wrongly, been called a portrait of Queen Mary. About the treasures contained in the muniment-room volumes might be written. The collection of documents is one of the most important in England, and among the MSS. may be mentioned the charter granted in 1153 by Earl Ranulph, the city Leet-book, and several account-books belonging to the corporation and to various of the guilds. There are also two volumes of letters addressed to the corporation on various occasions—one, from Queen Anne Boleyn, announces the birth of the Princess Elizabeth; another, from Elizabeth herself, charges the mayor with the safe keeping of Mary, Queen of Scots. Open the volumes where one may, there is sure to be something of interest in the history of the city or of the country at large.

Close to St. Mary's Hall is one of the most beautiful timbered houses in Coventry. The carving of the beams and gables is exquisite; but unhappily this is the only one left standing of a whole row of houses, which were pulled down some years since to make room for various modern buildings. The carved gables of the demolished houses are engraved in Pugin's work on the subject, and are among the finest examples contained in it. In the same work may be found examples taken from Ford's Hospital, in Greyfriars Lane, which shows, on a small scale, all that is best in the architecture of the period. It is in the form of a quadrangle, and is entered from a mean and dirty

street by a low archway, which leads into a tiny court only a few feet wide. In the window of the little room which was once the chapel are two curious figures, representing the Virgin and St. John. The building, small as it is, is quite equal in interest to the far better known Leicester Hospital at Warwick. Of similar character, but far larger and rather less beautiful, is the Bablake Hospital, at the west end of the town, where there is a fine portrait of John Hales, the founder of the Grammar School, probably by Holbein. St. John's Church, which stands to the south-west of this hospital, and close to the site of Spengate, has lately been restored, with considerable benefit to the interior, at any rate. The floor, which had for some inscrutable reason been raised several feet, is now lowered to its original level, and the bases of the pillars have been uncovered. The church is both beautiful and curious. The choir has a northward bend, as is also the case in St. Michael's, and the west wall is not at right angles with the two adjoining it. Several of the pillars, too, are very much out of the perpendicular. The church was founded soon after the formation of St. John's Guild, in the reign of Edward III. It is impossible here even to mention all the buildings which are worthy of admiration and study. Two more must, however, be named—the Grammar School, once the church of St. John's Hospital, noteworthy for the rare and beautiful tracery of its east window; and the old Palace in Earl Street, which has been sadly mutilated by the base uses to which it has been put, though it still possesses many features of interest. A curious fact about it is that there appear to be no means of ascertaining who were its original owners. The name of the street in which it stands suggests their rank, but nothing more is known of them.

In spite, or perhaps in consequence, of the vast wealth of material available for the purpose, no adequate history of Coventry has yet been written. Those best qualified to deal with the subject have confined themselves for the most part to monographs on the various branches of it; and to their labours, especially to those of Thomas Sharp the antiquary, the future historian will owe very much. Dugdale's work is, of course, extremely valuable; but as its author was writing the history of Warwickshire, not of Coventry, it does not go into the subject with the minuteness which its importance deserves. At the very outset the student is met by a difficulty, in the uncertainty which attaches to the origin of the name. The most obvious explanation of the first two syllables is that they refer to a convent which undoubtedly existed in very early times; but as the last syllable is of course *tre*, the British word for town, some authorities prefer to regard the remainder of the word as a modification of *Cine*, which they take to be the ancient name of the river Shirburn. However this may be, a nunnery certainly existed in the time of Canute which had a great repute on account of the virtues of St. Osburg, who had been its abbess. It was destroyed in 1016 by Canute and Edric, and we hear no more of Coventry until the reign of Edward the Confessor, when Leofric, Earl of Mercia, the husband of Godiva, founded the monastery which afterwards became so famous. This Leofric was descended from an ancestor of the same name, who was Earl of Chester in the reign of Ethelbald, King of Mercia. He was one of the most powerful nobles of the time, and it was his granddaughter Alghitha whom Harold II. was compelled for State reasons to marry. Another granddaughter was married to her kinsman Ranulph, and from them were descended Robert Bruce, King of Scotland, and Dervogil or Devorgilla, the wife of John Balliol, whose name is held in pious memory in the college which her husband founded at Oxford. The monastery, which was dedicated to St. Peter and St. Osburg, soon became very wealthy; it possessed rich manors in various counties, among others that of Eaton in Cheshire, while among its relics the most precious was an arm of St. Augustine of Hippo. It enjoyed, too, the privilege of being subject to no diocesan bishop; but this privilege was lost in the reign of William II., when Robert of Limesey, Bishop of Chester, obtained from the King the custody of the monastery, and by the Pope's authority moved his seat from Chester to Coventry. This was the beginning of misfortunes for the monks. The name of Abbot became extinct, "in regard that the episcopal dignity therein overtopped it," as Dugdale says. The fabric of the building fell into decay, and the monks were kept in strict subjection by the bishop. Several successive bishops lived here, and even dropped the name of Lichfield from their title, until it was agreed that the two places should choose their bishop in turn, precedence in style episcopal being given to Coventry. In the wars of Maud and Stephen, the Earl of Chester took the side of Maud; and Robert Marmion, of Tamworth, being an enemy of the Earl, expelled the monks and fortified the church. His ignominious fate is referred to by the Abbess in Sir Walter Scott's poem. He fell into a trench which he had dug for the enemy, and while in this helpless position he was killed by a common soldier. Ranulph, the Earl of Chester just mentioned, appears to have taken the part of the monks, and of the town generally, against the bishop. In 1153 he granted to the monks a charter, which has already been referred to, authorizing them to have two carts always going to and fro in his woods to carry timber for repairs and fuel. He also granted various privileges to the townsmen. He incurred the enmity of Walter, Bishop of Chester, and died excommunicate. The quarrel between monks and bishop came to a climax in the reign of Richard I., when the monks were expelled for assaulting Hugh Novant, their bishop. The assault, however, seems to have been committed under great provocation, for Hugh afterwards died

repentant at the abbey of Bec, having condemned himself to Purgatory till the day of judgment for the wrongs done to the monks, who were restored in 1198.

From this time the fortunes of the monastery began to mend. The existing charters were confirmed and enlarged in the reign of Henry III. by the then Earl of Chester, who died without male issue. After his death the lordship of Coventry came by marriage into the possession of Roger de Montalt, who sold it to the monks of Coventry to raise money to equip him for the Third Crusade. He reserved to himself only the manor-house and park of Cheylesmore, and the religious house of the Friars Minors, which had been lately founded. No doubt the latter exception was intended to protect the Franciscans from the enmity of the English monks, by whom they were hated as emissaries and agents of the Pope. In spite of the settlement of Franciscans among them, the monks remained faithful to the King, for we find that they suffered much at the hands of De Montfort and the barons, whose headquarters were at Kenilworth, about six miles distant. The monastery, however, prospered, and the welfare of the town was further promoted by Royal favour. Robert de Montalt, being without heirs male, entailed the manor of Cheylesmore upon Queen Isabel, with remainder to John of Eltham. As the latter died before Isabel, the manor came into the possession of Edward III., who settled it upon the Black Prince, and it is from this connexion that the three feathers appear in the city arms. Great privileges and exemptions were accorded to the citizens, and in 1346 the King granted them a charter of incorporation, the first mayor being elected in the following year. Soon afterwards the city walls were built, and in 1373 the tower of St. Michael's Church was begun by William and Adam Botoner, each of whom was twice mayor of the city. It is recorded in some copies of the city annals that a brass plate was found in the church bearing this inscription:—

William and Adam built the tower,  
Ann and Mary built the spire,  
William and Adam built the church,  
Ann and Mary built the quire.

It is, however, extremely doubtful whether any such inscription ever existed, and Thomas Sharp, whose opinion deserves the greatest possible respect, only mentions the tradition to discredit it. It is highly improbable that the Botoners did more than build the tower and spire. Richard II. made various grants to the town, giving stone from his park for the building of the walls, and granting to the corporation the waste land all round the town to pay for their maintenance. About this time the commons of Coventry were constantly rising, and on one occasion they pelted the mayor with loaves when he went to hold the assize of bread in St. Mary's Hall, because the bakers had not observed the assize, and the mayor had not punished them. John Onley, who was mayor in 1396, is recorded to have been the first Englishman born in Calais after its capture. His father, a Coventry man, was the standard-bearer of Edward III., and his son was born immediately after the taking of the town. He was twice mayor of Calais, and twice filled the same office in his father's native town. In 1404 Henry IV. held the Parliament known as *Parliamentum indoctum* at Coventry, and showed great favour to the city, though his associations with the place can scarcely have been pleasant, for it was here that he was sentenced to banishment by Richard II. on the breaking off of his duel with the Duke of Norfolk. Henry V. had no time to do more than confirm the city charters. At the end of his reign the commons rose, and destroyed the Royal gardens at Cheylesmore, but the cause of the rising is not recorded.

Thirty years later the crowning favour was conferred on Coventry by Henry VI., who constituted the city with the surrounding villages an independent county, the bailiffs of the city being sheriffs of the county. In 1458 the King held here the *Parliamentum diabolicum*, by which Richard Duke of York and his son Edward were attainted. In spite of its Lancastrian antecedents Edward IV. still favoured the city, and in the seventh year of his reign spent Christmas here with the Queen. Soon afterwards came the temporary reaction caused by the unpopularity of the Woodvilles, and in 1469 Earl Rivers and his son were executed on Gosford Green to the east of the city. On the return of Edward to England in 1471, the Earl of Warwick held Coventry against him, and after the battle of Tewkesbury the King came and took away the mayor's sword, and seized the liberties of the city. These were restored, however, on payment of 500 marks, and Edward, always politic, sent his son on a visit to Coventry, where he was well received. The city annals tell us, with some pride, that he stood godfather to the mayor's child, and received a present of a cup and 100*l.* He was followed by the King, who kept the feast of St. George at his manor of Cheylesmore. Richard III. found time in his brief reign to visit Coventry at the feast of Corpus Christi, and to see the miracle plays for which the city was famous acted by the guilds; and Henry VII., anxious to gain the goodwill of the most important town in the midland counties, went after the battle of Bosworth and lodged at the house of the mayor, Robert Onley—a descendant, no doubt, of the standard-bearer of Edward III., who has been mentioned above. The mayor was knighted, and the King received the traditional gift of a cup and 100*l.* In this and the following reign some of the most important of the city charities were founded. In 1497 the mayor was Thomas Bond, who founded the hospital called after him. In his mayoralty Prince Arthur visited Coventry, and was received with great rejoicings. The year

1521 is memorable for the mayoralty of Thomas White, the city's greatest benefactor, who left sums of money to be expended in gifts to the poor, and in free loans to enable young men to begin business for themselves after serving their apprenticeship. Twenty years later the Cross was built, by Sir William Hollen, on the site of another which had been pulled down in 1510; but this was the last important work undertaken in Coventry for many years. The dissolution of the monasteries almost ruined the town. It is true that a great deal of the property of the monastery was bought at a very cheap rate by the corporation and by private benefactors; but, as Dugdale tells us, "It was neither the lustre of their beautiful cross, nor all those large and easy acquisitions that did any whit balance the loss this city sustained by the ruins of that great and famous monastery, and other the religious houses which had so lately preceded." Trade fell off, and thousands of the inhabitants left the city. In the reign of Edward VI. John Hales, the founder of the grammar school, represented to the Duke of Somerset that only about three thousand inhabitants remained in the city, whereas within memory the population had been fifteen thousand. After the dissolution the site of the monastery was sold, and the building itself, with the cathedral, demolished, in spite of the entreaties of the Bishop.

For some time to come we hear little of Coventry. The Duke of Suffolk attempted to involve the citizens in Wyatt's rebellion, and, it seems, with some prospect of success; but the more prudent party prevailed, and the arrival of the Earl of Huntingdon at Warwick compelled the Duke to retire. On the occasion of Queen Elizabeth's visit to the city in 1565 the Recorder referred to the "lamentable ruin and decay thereof." He had good ground for complaint. The plague had been very deadly in Coventry during the previous year, and the clothing business was falling into decay, without the introduction of any new industry; but it does not appear that the Queen's visit did anything to mend matters. In the following year the city received a very doubtful mark of Royal favour in being chosen as a place of confinement for Mary Queen of Scots, who was imprisoned in the mayor's parlour. Three years later she was again at Coventry, when she was placed under the care of the Earls of Shrewsbury and Huntingdon at the Bull Inn, on the site of which the barracks now stand. Coventry seems to have escaped all connexion with the Gunpowder Plot, though Dunchurch was the appointed rendezvous of the conspirators, and Combe Abbey was one of their places of meeting. On the discovery of the plot the conspirators attempted to seize the Princess Elizabeth, who was then at Combe, but she was safely conveyed into Coventry. In the following reign the city was greatly harassed by the oppressive exactions of the King, and we find in the records that in 1635 "a silver-gilt bowl, 59 ounces, was given to my lord Bishop for his pains in settling ship-money." At this time the city retained its splendid appearance, though its material prosperity was in a great measure gone. Taylor the Water Poet, in a curious account of a summer's tour through the Midland counties, undertaken in 1639, describes Coventry as "a faire, famous, sweet, and ancient city, so walled about with such strength and neatnesse as no city in England may compare with it." He also suggests *trety count* as the derivation of the city's name; but his authority in philological questions is, of course, not worth very much. Mindful of their former wrongs, the citizens refused in 1642 to admit the King's army within the walls, though they expressed their willingness to welcome the King himself. The Cavaliers assaulted the town, and effected a breach in the walls; but the citizens stoutly maintained the breach, until they were relieved and the siege raised by the arrival of Lord Brooke with a cavalry force and the foot regiments of Hollis and Hampden. This took place two days before the King set up his standard at Nottingham. Twenty years afterwards this repulse was avenged by the demolition of the walls of Coventry, which had stood for more than three hundred years.

The subsequent history of Coventry offers few features of interest. The silk trade was introduced into the town early in the eighteenth century, and, with the watch manufacture, restored to a great extent its fallen fortunes. The French Treaty of Commerce again seemed to threaten the town with ruin, but the period of extreme depression passed away; new industries have been introduced, and perhaps a new term of prosperity may be associated with the manufacture of the bicycle.

#### COCKNEY SPORT.

'ARRY has always been a sporting man; his great ambition now urges him to be a sportsman. It is no longer enough for him to back horses whose names he knows not how to pronounce, and to risk the till on favourites which he has never seen; The mild excitement of glove-fights and of clandestine badger-baiting on Sunday mornings has begun to pall on 'Arry. He has read so much about fox-hunting in the erudite works of Ouida, and about coursing in the sporting papers, that he has determined to make acquaintance with water and with timber, with bull-finches and with raspers. 'Arry, in short, would a-hunting go. The demand, as political economists assure us, generates the supply; and the enterprising lessees of the Alexandra Palace have provided 'Arry with sport of the most suitable character. The following advertisement, addressed to Cockney sportsmen very

degenerate from good old Jorrock's, has appeared in some of the daily papers:—

THE HORN of the HUNTER will be heard on the HILL of MUSWELL TO-MORROW and every TUESDAY and SATURDAY. The ALEXANDRA PALACE FOX-HOUNDS will meet at 10.30 each Morning. Season Subscription, 5*l.* 5*s.* One day, 10*s.* 6*d.* "Do not be"

#### OUT OF THE HUNT.

What is called a "rehearsal" of the amusement of fox-hunting, as practised in an area of two hundred and fifty wire-fenced acres, was given a few days ago at the Alexandra Palace. A bag-fox, apparently a tame one, was turned out, and pursued by "some of the leading tradesmen of Holloway," who are reported to have looked somewhat uncomfortable in their saddles. A single fence of three feet in height had been erected, but the local sportsmen preferred to take a circuitous route and avoid this obstacle. The poor wretch of a fox took refuge in some suburban grove of laurels when he was tired of racing round his limited enclosure, and there he was ingloriously slain by a pack of thirteen couple of hounds, which are said to have been recently purchased from the Quorn. These discarded animals have been taught to follow a drag in and out among the shrubberies of the Alexandra Palace. Tuesday was the real opening day of the Palace Hunt, and about twenty horsemen met between the building which is occupied by a panorama of the siege of Sebastopol and the offices of the Company. The beginning of the sport was comparatively legitimate. A drag had been laid, and the Cockney sportsmen had their choice of leaping or of evading hurdles and water jumps, skirting the Colney Hatch road, and dashing past the primeval forests of The Grove. No one has any right to object to the local equestrians' desire to take exercise in this way, and doubtless the suburban air is healthier than the atmosphere of a riding school. But after the pursuit of the drag came the far more feverish excitement of a "real fox hunt." A tame animal was let out of its bag, and showed no desire to flee from the face of man. The bag-fox merely sat down and contemplated the varied attractions of the Alexandra Palace. Having exhausted these delights, the poor creature crept into a shrubbery, and, having passed a bad night in the bag, prepared to go to sleep in a thicket "just in front of the central arch of the Palace." As he showed no signs of leaving this insecure retreat, the hounds were sent into the bushes, and slew the quarry ingloriously. The crowd gathered round, and eagerly watched the hounds as they devoured the poor sleepy bag-fox, butchered to make a cockney holiday.

The historian of the Crawley family mentions that the younger Rawdon, in his boyhood, could conceive of no sport more noble and manly than ratting in a barn. Ratting in a barn is certainly a more natural and honourable pursuit than watching the worrying of a tame fox in a laurel grove. It is sufficiently plain that the real attraction at the Alexandra Palace is not the riding, nor even the display of skill shown by the avoidance of hurdles, but the brutal part of hunting with which sportsmen could most happily dispense. The holiday crowd of gazers like to see a worry, to watch a poor brute taken at advantage, and destroyed by powerful foes. People who love to look on while women are fired out of guns at Music Halls, and while children risk their necks on the trapeze, are naturally charmed to behold a tame fox torn piecemeal. These sportsmen are cultivating a habit of mind which will soon enable them to stand by, as diverted amateurs, when a man cuts his wife to pieces, or a crowd of roughs kick a stranger to death.

The Alexandra Palace fox-hunt, if it has been correctly described, is perhaps the very lowest form of sport which has yet been discovered in an age of sport made popular and easy. We used to think that it was impossible to fall below the level of the Rosshire chase, in which the fox arrived in a bag by the 10.45, and the hounds came on in a train at noon, while the wire fences prevented any attempt to follow the hunt. But the sportsmen engaged in that pursuit did not, at least, shut up their bag-fox in an area of two hundred and fifty acres. On the whole, the Kempton Park Coursing Meeting seems to afford a closer parallel to the sport at the Alexandra Palace. Coursing is at no time and in no way the most humane of sports. It is best when it is, as it used to be, quite natural—when farmers take the greyhounds out over an open tract of country, and course such hares as they may happen to find. Here the hares know their ground intimately well, and are in the prime of health and natural training. Coursing is less natural, and therefore is less of the nature of sport, when hares are driven in from a large surrounding district, as in the great contests like that for the Waterloo Cup. Third in the scale come the enclosed grounds, like Gosforth Park, but even here the hares—the imported hares—have a chance, if they are left long enough in the place to know the nature of the country and of the escape. One old Irish hare is said to have been coursed seventeen times last year, and to have got clean away after all. But at Kempton Park, an enclosed place, it is said (by a contemporary) that "many of the hares had been on the ground but a few hours, and, consequently, knew nothing of their surroundings; while they were stiff and cramped from their confinement during a long journey by rail, the ground was so narrow that they had no chance of escape. Consequently on the first day only two hares were not killed by the greyhounds, and they were afterwards found dead." If this report be correct, the performances at Kempton Park far outdo the enjoyments of the Alexandra Palace. It is not a mere couple of foxes a week that are chopped in

a suburban shrubbery, but a whole crowd of tired bewildered bag-hares that are turned out for the parqu岸 of greyhounds, and to be instruments of betting for sporting gents. That is what modern coursing has come to be. We may be charged with sickly sentimentalism, but we confess to no great liking for the sport in itself. The odds against the hare are rather too great. One thinks of Shakespeare's description of hare-hunting:—

By this, poor Wat, far off upon a hill,  
Stands on his hinder legs with list'ning ear,  
To hearken if his foes pursue him still.  
Anon their loud alarms he doth hear.  
And now his grief may be compared well  
To one sore sick that hears the passing bell.  
Then shalt thou see the dew-bedabbled wretch  
Turn and return, indenting with the way.  
Each onvious briar his weary legs doth scratch,  
Each shadow makes him stop, each murmur stay.

To be sure "poor Wat's" troubles are over sooner when he is hustled out of a railway into a wire-enclosed space of heath.

Sport is respectable and admirable just in proportion to its arduousness and difficulty, and to the knowledge which it should demand of the haunts and habits of animals. A man sets his walking powers and his cunning against those of the stag, his skill against the caution of the salmon, his trained eye and ready hand against the wild flight of the grouse. This is all very well, and, so pursued, sport is the most healthful and delightful training for the serious hard work of life. It requires a minute knowledge and careful observation of nature and of the habits of birds and beasts. But the essential character of sport is deliberately ruined by modern contrivances. We try to make sport easy, instead of hard, and to make a knowledge of the habits of hunted creatures quite unnecessary. Pheasants are artificially reared in millions. Partridges are crowded into the fewest possible fields. Grouse are driven, and the excellent sport of the moors becomes a kind of superior pigeon-shooting. Even stags are driven, that so-called sportsmen may fire at random among hinds and fawns, and be enabled to brag of the heads they have secured without distress or difficulty. As to fox-hunting and coursing, the managers of Kempton Park and of the Alexandra Palace have shown the way to make these sports easy and safe. We have not yet succeeded in taming salmon, but probably the use of dynamite and rake-hooks will become more and more popular, and will be unblushingly practised whenever the water is low. In short, modern sport is degenerating into organized poaching, in which nothing is considered but the easiest way of making a big bag or basket. We expect soon to read that the Duke of X, with Lady So-and-so, had a capital day with dynamite on this or that river or loch, and "brought to bank" seventy salmon, beside three hundred grilse and sea-trout. Sport of that sort would be no more than a rational extension of the practices of driving deer and coursing bewildered bag-hares. It would be as easy to bet on the results of angling with dynamite as on those of Cockney coursing. In the off-season noble sportsmen might amuse themselves like Signor Paglia, who has been shooting swallows at Battiferro, near Bologna. The Signor took six breech-loaders to the ground, and killed 2,186 swallows in the course of the day. When swallows take to sitting in long rows on railings and telegraph-wires, it would be even more easy, and therefore more in the character of modern sport, to pot them. The President of the Bologna Shooting Club, who is said to have applauded Signor Paglia, should certainly, now that the swallows are departing, come to England, hunt at the Alexandra Palace, and course at Kempton Park.

#### THE PARIS ELECTRICAL EXHIBITION.

IN a former article we explained that the Electrical Congress had settled the question of the international standards of electrical measurement. We may now give the nomenclature of the standards adopted. The Volt is the unit of electromotive force, and the Ohm that of resistance, both keeping their old values as well as their old names. The unit of current is to be called the Ampère, and is the current given by one Volt acting through a resistance of one Ohm—in fact, it is the unit of current hitherto known as the Weber. The reasons for this change of name will of course remain in obscurity until the proceedings of the Congress are made public. The quantity of electricity conveyed per second by a current of one Ampère is now to be called one Coulomb; and the unit of electrostatic capacity which remains the same as before—the Farad—is connected with the other units by the formulae that one Coulomb in a Farad gives one Volt, or that, if a condenser of one Farad capacity be charged by an electromotive force of one Volt, it will contain one Coulomb. As to the defining of a mercury column of the resistance of one Ohm, we fancy that it has been of most value as a piece of diplomacy at the Congress; when defined, such a standard will be troublesome to make, and by no means easy to use. We venture to think that for scientific investigation, the usual German silver resistance coils will always be used as at present, except in cases where for very delicate work it becomes necessary to go to the expense of employing coils made of the platinum silver alloy used for the standard B.A. unit coils. For practical work probably coils of copper will soon be made at a low price and of quite sufficient accuracy; for, just as a grocer has no need of a delicate chemical balance, and does not observe the height of the barometer and the reading of the thermometer every time he

weighs out a pound of sugar, so the electrical engineer, in measuring the resistance of a line wire or of a coil, is generally content if he can depend upon his instruments giving results accurate within a small range of probable error. And, as measurements of resistances are generally made by Wheatstone's bridge, by which the resistance to be found is given by the proportions which the unknown resistance and three known resistances bear to each other, it is evident that even a rather large error in these known resistances will introduce but a small one in the result.

Some accidents have unfortunately happened in the Exhibition, which will, no doubt, be taken advantage of to raise a "scare" about electric lighting and the transmission of energy by electricity. It has become well known now that several fires have arisen at the Palais de l'Industrie; but, if we examine into the causes which have produced them, we shall see that they need no more raise uneasiness about electric lighting than the burning of a house by allowing a naked gas-burner to swing against the curtains of a bed need cause us to reject gas lighting as frightfully dangerous, or than the fact that an old steam-boiler, designed to work at 50 pounds per square inch pressure, has exploded when worked at 150 pounds per square inch, need make us decline to use steam-engines. Thus one fire was caused by allowing an arc light to burn without any means for preventing the flakes of glowing carbon, which always split off from the electrodes in a greater or less quantity, according to the quality of the carbons, from falling on to a wooden floor; and others have occurred from the overheating of conducting wires, caused either by their being too thin, or by the two conductors of one machine making contact, this last class of accidents having been entirely caused by hasty work executed by unskilled men. The quantity of heat generated per second in a conductor of known resistance by a current of known measurement, and hence the highest temperature to which that conductor can be raised, is readily calculated, so that in any permanent system this danger of overheating can easily be avoided. Further, the loss of energy due to using conductors of too low resistance is so great that electrical engineers are inclined to erect conductors, or "leads," as they are technically called, of less resistance than is absolutely necessary rather than to put up leads likely to cause danger from overheating. The danger from contact of wires is hardly to be considered in a well-planned permanent system. We may also take into account in discussing these accidents the fact that the lighting systems are competing one with another at the Exhibition, so that if any lamp appeared less brilliant than its neighbours, there would be instant temptation to force up its illuminating power by increasing the speed of the driving engine, and so increasing the current. These fires may serve a good purpose by forcing upon the minds of "practical men" the necessity of measurements and the utter uselessness of rule of thumb and "experience of twenty years, sir"—the two tools and weapons of the hopelessly ignorant, blind, obstinate, vaguely speculative class of men who love to give themselves this title.

Whilst on the subject of danger, we may say a word or two about danger to life and health from shocks accidentally received. There have been some cases of death within the last few years, but these have all been caused by alternating current machines, which are extremely dangerous when of high electromotive force. The continuous current machines, however, do not give such severe shocks, and, in the opinion of many scientific men, are not dangerous, though capable of inflicting considerable pain. However, it will be the duty of every electrical engineer to take care so to place his leads as to make it almost impossible for any one to touch both at the same time, severe shocks being thus entirely prevented. On the whole, were every house lighted by electricity and every factory to receive its "power" in that form, the dangers would be much less than those which exist now from gas and boilers. For no bad workmanship or carelessness can by any possibility cause an explosion to be produced by an electric current; and, in the event of a fire taking place, conducting wires would only heat, and perhaps fuse, instead of feeding the flames with combustible and explosive matter as gas-pipes do when fused by the heat of a burning building.

The number of dynamo machines at the Exhibition is very great, but for the most part they are all modifications of the well-known forms—i.e. those of the Gramme type with ring-shaped armatures, or those of the Siemens type with cylindrical armatures. Of the first type the most original is perhaps the Birgin machine exhibited by Mr. Crompton, which may be roughly described as consisting of a number of thin Gramme rings mounted side by side, each ring being a small fraction of a revolution in advance of the next one, the effect of this arrangement being to make the current more continuous. The rings are further polygonal, instead of circular, which reduces the difficulty of winding the coils, and enables the rings to be more securely and rigidly attached to the revolving shaft. But there is one exhibit which must give many inventors most bitter feelings. This is in the Italian section, where Professor Antoine Pacinotti of the University of Cagliari exhibits some models of machines made by him so long ago as 1860, and described by him publicly in 1864. We see here almost every detail of the modern dynamo machines; one is a Gramme machine, another a Brush machine. Not only are these early forms identical in principle with the modern types, but even important details are the same in both. Professor Pacinotti used wire brushes in connexion with his commutators, and placed them in the same position as that adopted by modern construc-

tors. The existence of these forgotten instruments is another proof of the fostering power of commercial enterprise on scientific progress. These beautiful and useful inventions died in Italy, whilst their exact counterparts in France, England, and America have brought honour and profit to their inventors, and have helped on the work of pure scientific research.

The electric transmission of energy is fairly well represented in the Exhibition, the apparatus varying in size from the original ploughing gear of M. Menier to tiny motors used to propel toy boats. Speaking in general terms, for driving large machinery the Gramme machine is used, whilst for lighter work, such as driving sewing-machines, small boats, &c., Siemens's armatures are used with either permanent or electro-magnets to produce the magnetic field. In the important class of railway signalling apparatus there are several exhibits, many of which, though ingenious, are complicated, and not thoroughly suited to the purpose. Mr. Sykes's system of electric locking of signals from station to station, which has been used on the Metropolitan District and some other railways in England for some time, is exhibited. Perhaps the most promising novelty in this direction is Mr. Spagnoletti's system. The locking apparatus on the signal lever is contained in a space not much larger than two sealitz-powder boxes, and the whole apparatus seems to leave no room for accident by the intervention of human carelessness. If a signalman at station A wishes to send a train to station B he is unable to lower his starting signal until he has asked permission from B; if the line is clear, B unlocks A's signal; A lowers it, and, on putting it back to danger, it locks itself; in addition, by the act of unlocking A's signal, B breaks the line-wire between the two stations, so that he can no longer unlock A's signal. The train, on passing out of B's station, however, restores the continuity of the line automatically, and so restores the power of unlocking the signal at the station behind. It is thus impossible for two trains to be in the same section of the line at the same time. This system has been put up on parts of the Great Western line.

The same inventor also exhibits a very ingenious and novel fire-alarm, by which any number of alarms can be put on one line wire, each, when set going, indicating its name at the central office on a dial. The requisite makes and breaks of the circuit are effected by a metal ball, which, when released by a lever, rolls down a sort of railway, making contacts as it goes; thus rendering the action of the transmitter uniform and regular, however excited and careless the person setting the instrument in action may be.

In the class of telephones and telephone transmitters we find practically nothing that is new, with the exception of Dolbear's induction telephone in the American department. This remarkable instrument consists merely of two plates of ferrotype iron, separated by a vulcanite ring rather less than the tenth of a millimetre in thickness, forming in fact an air condenser; these plates are connected one to each terminal of the secondary circuit of an induction coil at the transmitting end, in the primary circuit of which is included a battery and a microphone transmitter. The variation in the mutual attraction of the two plates from their varying charges received from the coil is sufficient to clearly reproduce speech. It is further claimed for this instrument that, as the line circuit is never closed, it will be less affected by induction than other forms of telephone. An ingenious modification of the microphone is exhibited in the Belgian section by M. Lochot Labye, under the name of the "Pantéléphone"; it is not only one of the simplest transmitters yet made, but is perhaps the most sensitive, transmitting ordinary speech at distances of thirty and forty yards, and the lowest whisper at a distance of two or three feet. It consists of a plate of cork about six inches long and four wide, suspended by two pieces of slight watch-spring from one of its short sides. In the middle line, close to the bottom edge of the plate, a button of hard carbon about the size of a shilling is embedded and placed in electrical connexion with one of the suspending springs by means of a wire. The button is pressed upon by a hinged brass hook, the hinge being made sufficiently stiff to enable the pressure to be adjusted by turning the hook more or less on its pivot; the current passes from the hook through the carbon to the upper spring. The instrument is connected up in the usual way with a battery and induction coil, and any of the well-known types of telephone can be used at the other end of the line as a receiver.

A curious transmitter is shown in the Swiss section by M. A. Amsler. In this instrument the microphone part of the circuit is formed by a little flame, adjusted until it is very nearly a "singing flame." This just makes contact with a platinum wire, and by its elongation and contraction under the influence of sound vibrations varies the resistance sufficiently to transmit speech. Of course this apparatus is only a philosophical toy, but it is yet of some scientific interest.

In the class of telegraph instruments there is a fine display of almost all the known forms of apparatus, but not much that is new; the two most interesting novelties, perhaps, being a very ingenious and comparatively simple instrument for transmitting writing or drawings in facsimile, invented by M. Meyer, and exhibited in the department of the French Government Telegraphs. The design is reproduced in coloured lines on a white ground. The Ministry of War has already used it experimentally for sending sketches of military positions, &c.; but, as it depends on the exact synchronizing of two sets of clockwork—as do all instruments of this kind—it is not likely to succeed in field telegraphs. In the same department is shown a modified form of Professor Hughes's type-printing instrument, devised by M. Baudot. The key-board

is reduced to five keys, the signals being given by combinations of keys pressed down together, as chords are played on the piano. It also allows of six messages being transmitted simultaneously on one wire.

The classes of physiological and medical apparatus are very disappointing, and do not represent even tolerably the ordinary forms of instruments in every-day use. The instruments of scientific electrical research are well represented; but we were unable to find anything of especial interest.

One of the most perfect examples of mechanical skill, both in adaptation of means to their end and in finished workmanship, is the Telemeteorograph of Van Rysselberghe, exhibited by the Observatoire Royale of Brussels. This instrument records at intervals of a quarter of an hour the readings of the wet bulb and dry bulb thermometers, the height of the barometer, and the direction and force of the wind, and engraves the records on a cylinder of zinc, from which the curves and their co-ordinates can be at once printed, the whole operation being conducted perfectly automatically.

The most interesting thing in the whole Exhibition from a scientific point of view is undoubtedly the apparatus and experiments of Dr. O. A. Bjerknes in the Norwegian section. By the action of vibrating bodies in water Dr. Bjerknes has succeeded in reproducing the phenomena of the magnetic field; his vibrating bodies consist of little drums with india-rubber heads, set in action by pulses of air from a little air-pump—which behave like isolated poles, and of solid spheres vibrating backwards and forwards on one of their diameters which behave like bar magnets. All the phenomena of attraction and repulsion between magnets are reproduced by these instruments, and tracings can be taken of the lines of force round them, which exactly correspond to those of the magnetic field. Again, a vibrating body and a non-vibrating body behave like a magnet and an unmagnetised substance, the non-vibrating body behaving as a magnetic or paramagnetic body, according as its specific gravity is less or greater than that of water. Further, Dr. Bjerknes has produced tracings identical with the lines of force round a current by using a ball making half turns each way in rapid succession. We may hope that when his mathematical theory of these effects has been well investigated, some fresh gleam of light may penetrate the darkness which still conceals from us the true nature of electrical and magnetic phenomena.

#### THE SALVATION WAR CRY.

TO a casual observer the Salvation Army seems to have attained its chief purpose. Its leaders profess to wage an organized warfare with sin and "the Devil," who is represented by the roughs of the various towns in which the forces of Salvation pitch their camp. If the leaders want a good fight, they have not been disappointed. Sunday is made hideous every week in many towns and villages by battles between the Salvation Army and their secular opponents—if, indeed, these affairs can be called battles in which all the kicking and striking is on one side. Many of our fellow-countrymen in Lancashire and elsewhere spend Saturday night in kicking any inoffensive strangers they may chance to meet with clogged boots. To these sportsmen the appearance of the Salvation Army seems a providential boon. Many of the officers of the army are women, like Captain Kate Taylor (*née* Watts). Both privates and officers feel bound to suffer peacefully. Thus they are the natural sport and prey of the kicking section of the population. Both sides are pleased; the roughs gratify their ruffianly instincts, the members of the Salvation army rejoice in the luxury of martyrdom. The only people who are not satisfied by these battles are the somewhat large proportion of citizens who neither care to "get properly saved" by "Hallelujah methods" at "Salvation free-and-easy," nor yet rejoice in persecuting evangelists whose scheme of operations and whose language are certainly displeasing to a cultivated caste.

People have asked, rather superfluously, why the Salvation Army is so apt to get kicked, pelted, and ducked? Other preachers and propagandists seem to receive more hallicence than kicks. Any one may preach any doctrines, from those of Buddha or Confucius to the truth as it is in Mr. Bradlaugh, in any open space, without disagreeable consequences. A small and inattentive crowd, dwindling down to nurses and infants in perambulators, listens to Mr. Stiggins as he "lets old 'Uxley and Darwin have it 'ot," or to some equally fervent missionary who easily disposes of the evidences of creation from design, or gets rid of the doctrine of a future life. No one molests these preachers, and, as Mr. Tennyson observes, "a man" (or even a woman) "may say the thing he will." It is only the Salvation Army that may not say the thing it would like to remark. There is nothing naturally irritating to the popular sentiment in the banners and music with which the Salvation Army adorns its processions and services. Tishborne mobs, the Ancient Order of Foresters, the Band of Hope, and a number of patriotic Irish associations, go about with banners and music, whenever they please, and nobody stones and kicks them. The Salvation Army readily explain their own peculiar sufferings by the theory that the Devil himself is raging against them, and that he has secured the aid of the publicans, who, again, have egged on the sinners. But it is a wise rule not to advance a purely supernatural hypothesis when a natural one will serve the turn. We are driven to the conclusion

which we have already advanced, that the Salvation Army is assailed and bullied chiefly because it is pacific, and will not return evil for evil. Partly, perhaps, its enemies are irritated by the notorious fact that the Salvation Army regards them as by no means "properly saved," and does not entertain the faintest fear of meeting them again in another and a better world.

It is not more difficult to explain, what may puzzle the Salvation Army, the indifference of educated people to their doubtless honest and well-meant propaganda. A copy of the Salvation newspaper, *The War Cry*, lies before us, and in all religious literature we have seen nothing more painfully grotesque and unconsciously irreverent. The vagaries of nigger preachers, the extravagances of nigger sacred melodists, the extravagances of the old Puritans when most hopelessly deprived of the sense of humour, are all easily outdone by the performances of *The War Cry*. Few hymns are good considered as literature, and Mr. Arnold is fond of quoting one which begins

My Jesus to know  
And to feel his blood flow  
'Tis pleasure immortal, 'tis heaven below,

as an example of the religious taste of the middle classes. But the following composition (from which we have struck out a verse that excels the others in irreverence) would probably seem grotesque to a crowd of enthusiastic plantation hands at a camp meeting:—

(Original for the War Cry.)

GOING UP.

BY STAFF-CAPTAIN PEARSON.

TUNE:—"I'm bound to go." (S.A.M. 1.)

Good Elijah went to Heaven,  
In a chariot of fire;  
Bright and warm to glory driven,  
Fiery horses drew him higher.

CHORUS.

We're going up, we're going up  
In chariots, we're going up;  
We're going up, we're going up,  
At Army speed, we're going up.

Up God's deathless way to glory,  
Where God's holy seraphs burn;  
Enoch travelled by translation,  
With no ticket to return.

John and Stephen saw the City,  
When the door was open wide;  
Heaven may look sublime and pretty,  
But 'tis best to be inside.

Up to glory Paul was carried,  
Wondrous things to hear and see;  
He surveyed the Upper Country,  
Went right up to Number Three.

Millions now are up in glory,  
Up from sin, and death and hell;  
In God's best Salvation Chariots,  
We are going up as well.

Saints go up from Army Stations,  
Fiery horses still depart;  
In God's going-up Salvation,  
Up to glory all may start.

There must be something wrong in a religious movement which prefers to speak of the Third Heaven, in hotel style, as "Number Three."

One of the most moving contributions to *The War Cry* is the spiritual autobiography of Major Taylor. The gallant Major recalls some of his early offences when he was still a child of sin, and, as he says, "spent much precious time in the service of the Devil." Thus he relates how his father, a farmer, once told him to go and shut a gate, on a dusky evening; how he went off, hid in a hedge "as long as I thought it would take me to get to the gate and back," and then announced that the gate was closed and "it was all right." But the Major's father, an energetic disciplinarian, discovered and punished this little bit of work done in the service of the Devil. On another occasion the Major drenched his coat in a pond, and then came home and said that it had been too wet for him to go to school. As this trick was played off on his mother, the Major escaped detection. He now became "very anxious"—and it was high time—"about his soul's salvation." He was converted—we observe, with regret and apprehension that he does not know the exact "hour or date" of this experience—and, as he says, "I am in the fountain now." At the age of sixteen he became a draper's apprentice, and "began to work for Jesus." Since he joined the Salvation Army he has been much exercised as to the propriety of going to distant "knee-drills" and Salvation reviews by railway on Sunday. But he has come to the conclusion that it is definitely wrong, and now he is quite "sanctified and made whole." After being "drilled at Whitechapel for two months," he was shunted to Middlesbrough. "There I lost a lot of harmonizing ideas, and got into the Hallelujah style, which I soon saw clearly to be the best for our job." From this we gather that the preachers of the Salvation Army do not appeal to the mere human reason by sermons, but to the emotions, by dint of ecstatic howling. Thus Captain Pearson writes in a bulletin:—"Talk about sharp-shooting, 160 speak in one hour; are not 160 short good testimonies better than two hours' bad preaching?" Certainly nothing can be worse than two hours' bad preaching. And yet there cannot be much coherent argument in testimonies delivered

at the rate of two and a fraction per minute. This is the style of thing, however, which suits "a regular Hallelujah man." From another remark of Major Taylor's we learn that the peaceful public really has one very palpable grievance against the Salvation Army. "It was at Boston that a woman, enraged with our proceedings, exclaimed, 'Coming here on a night with your row, wakening up the bairns after they are gone to sleep!'" There can be no doubt, we fear, that the Salvation Army are rather noisy, not to say rowdy, evangelists. The class of people they wish to convert are generally accustomed to noise and disturbance, and possibly would not be attracted by any quiet and decorous manoeuvres. When a gentleman or lady is comfortably seated with gin or beer, only a very pronounced tumult in the street will draw him or her from earthly enjoyments. To make a noise, then, to get up "Salvation free-and-easy" and "Hosanna tea-fights," is, perhaps, sagacious strategy. But, if these tactics lead to a regular fight, the Salvation leaders have scarcely reason to complain.

The proceedings of converts, of recruits in the Salvation Army, are eccentric.

Several wept their way  
To Calvary Before Breakfast,

writes Captain Lloyd, with all the emphasis of leaded type. A convert explained, with tears in her eyes, the material results of the change in her spiritual condition. Her husband had now got a pair of boots, for lack of which in his unconverted state he had endured considerable inconvenience. A very startling penitent, whom one would even now rather not meet at a Hallelujah tea-party, said, "I thank God I am saved. I have been very near committing murder. I have taken a loaded pistol upstairs with the intention of shooting my mother, but God stopped me just in time." "We could mention many other such cases," says the editor of *The War Cry* calmly, just as if a large proportion of the unconverted were in the habit of taking loaded pistols upstairs with the intention of shooting their mothers. In Whitechapel a convert announced that, "before he was saved, he intended that night to shoot George Moor of the Christy Minstrels." Now that he is saved, he has thought better of this rash purpose, and Mr. Moore also has been saved, in the worldly sense of the term, from the revolver of the man of Whitechapel. In Whitechapel, too, "a poor woman who was going to throw herself into the Thames came and threw herself into the Fountain instead"—the fountain, that is, where the converted Major Taylor announces that he has taken up his quarters. Yet another convert has given up "reading Payne's works" (not those, we presume, of Mr. John Payne), and another has ceased to consider fifteen pints of ale a day necessary to his health and happiness.

All this is very gratifying, and it would seem that the ranks of the Salvation Army are being rapidly recruited with confirmed drunkards and poor crazed creatures on the borders of homicidal and suicidal mania. Yet it may be worth while to warn the generals of the force that the zeal of these recruits is apt to outrun their discretion, and that they may astonish both the religious and secular world by acts of which the motive force is supplied by drink, though the direction may have been given by a hastily accepted theology.

We conclude with giving a wider circulation to the modest wants of Bandmaster Fry. "Bandmaster Fry will be thankful if any of the Lord's Soldiers have a double-action Harp, not in use, to send it to Head Quarters, to be used in the Army Band for the Lord!"

#### BOULOGNE, PAST AND PRESENT.

WE do not know whether Queen Mary's lament over Calais is to be counted among the "mock pearls" of history; but possibly Her Majesty's grief might have been assuaged could she have projected her mind into the future. For it is certain that with the surprise of the last of our Continental possessions we did not finally lose our command of the gates of France. Some centuries afterwards the English occupied Boulogne in force, and they are unlikely ever to relax their hold upon the place. English society in Boulogne after Bonaparte was exiled and Europe pacified was a synonym for all that was insolvent and disreputable. Men who had outrun the constable took passage thither in the Channel packets; and, while doing their best to keep body and soul together, looked wistfully to the cliffs of England and lamented lost opportunities. In Boulogne they might live cheap, but it was hard to eke out precarious remittances. The natives, while finding some pickings on the most unpromising subjects, strongly objected to being preyed upon themselves; and the swaggering sharpers in the impecunious community of our countrymen were better known by foreigners than respected. In the words of the French proverb, "Les loups ne s'entremangent pas"; and to each other they presented few opportunities of doing profitable business. The extent of their habitual gambling was a game at cards or pool, for love or for refreshments, and to keep their hands in. Now and then, with luck, they might replenish their purses for a time, when some simple-minded victim fell into their clutches. Young gentlemen with more cash than brains, when starting on a Continental tour, either found themselves greeted cordially by some former acquaintance or slipped somehow into passing intimacy with a plausible stranger, who courteously volunteered to do the honours of the

place. For in those days of diligences and post-chaises men travelled leisurely, and they were likely enough to break the journey at Boulogne after some sharp tossing on the waves of the Channel. The introduction was followed by a dinner invitation on one side or the other; the Boulogne settler presented companions and confederates; wine was circulated freely, and possibly drugged; cards were suggested to kill the evening; and then followed one of those sensational little dramas which Mr. Wilkie Collins has elaborated in one of his recent novels. No wonder that Boulogne got an evil name as a sanctuary and place of refuge for debtors and swindlers. But, as poverty brings one into contact with questionable companions, the pauperized society was extremely mixed. Side by side with the shabby and unscrupulous good-for-nothings vegetated a number of families of unimpeachable respectability. Their straitened means were their misfortune, not their fault, and they had gone to Boulogne for economy and "educational advantages." The educational advantages were more than problematical. At best the children picked up indifferent French from teachers of the Pas-de-Calais whose language was seldom pure, and from servants who spoke detestable patois. And as they grew up they stood in need of close watching by parents who were often pre-occupied by domestic worries. The lads had the worst of examples in the *vauriens* of whom we have spoken; and as to the daughters, when the spotless lambs were left to themselves, there were wolves watching to pounce on them everywhere. On the whole, the very promiscuous mixture of classes must have tended to the general demoralization. Yet there must always have been a sufficiency of decent-living people to save the place from any such visitation as rolled the sea of salt over the submerged Cities of the Plain. Inscriptions on churches still bear witness to the piety that provided for the religious wants of the settlers, though the means of endowment were necessarily deficient, and the clergymen must still live by seat-rents and alms-offerings. The town from the beginning began to be steadily Anglicized. A brisk business must have been done in the ale and stout which are still advertised in each bar window and eating-house. Second-rate *pensions* sprang up in certain quarters in each side street, where we imagine that inferior French meat was treated in rough-and-ready English fashion, while "pique," corrected by brandy, did duty for the vintages of the Gironne. Chemists, no doubt, increased and multiplied as at present, for English people, as Thackeray used to remark, must have their medicines go where they will. Finally, a large part of the French population was inoculated with some words of broken English; while alternative English inscriptions over half the signboards showed startling examples of phonetic spelling.

Such was Boulogne in the old days as our fancy paints it; and fancy has been assisted by tradition and research. As for the modern city, with its inhabitants of both nations, we have little but good to say, so far as a short sojourn has made us acquainted with it. Indeed it strikes us that it is far less known than it deserves to be. Though within some six-and-twenty miles of Folkestone, and though it is still semi-colonized by our country people, it nevertheless remains thoroughly French. You see French life in the open air, French manners, and the characteristic and old-fashioned costumes of the lower orders, to as much advantage as in watering-places on the Mediterranean or Bay of Biscay, and in greater variety. For those who love to lounge and who can find amusement in tridles, there is something to be done or seen at all hours of the day. We have spoken of Boulogne as a city advisedly. Judging by the age of the houses, it must always have straggled over the hills on which it is built; but of late years it has extended itself amazingly. It always sent forth its fleets of fishing vessels; but since the construction of international lines of railway, it has greatly developed the Channel traffic. Manufactories have sprung up along the banks of the Liane, and in the younger town of Capécure on the opposite bank of the river. There are suburbs extending far into the country; when you think you are fairly out of sight and hearing of the town, you suddenly turn the corner of a wood into an outlying street; and there are populous inland villages in the immediate neighbourhood, which seem to be chiefly inhabited by fishermen who put to sea from the port. There is a dock of very ample dimensions, berthing many ships and steamers of considerable burden; and when the new deep-sea harbour works to the south shall have been completed, commerce and building operations must receive an immense impulse. There is always a lively scene on the bustling quays, where steamers are loading or unloading; and you thread your way among piles of cotton-bales, cases of champagne, of tinned meat and biscuits, heaps of beet-root sugar-loaves, or loads of Norway timber. The long piers are naturally a favourite promenade for strangers, though they are roughly boarded with ventilating planking, and though they are far from the quarters occupied by residents. And it is an exciting sight at high tide, when there is a stream of vessels either way through the narrow "gut," from the new double-funnelled Folkestone steamer with its upper deck crowded with British tourists, down to the tiniest of the fishing schooners, with the crew clad in brown, matching the rich neutral tints of the sails. But many of the Boulogne fishing barks are strongly manned and of considerable tonnage, as they are fitted out by men of capital, and sent on cruises to the Scotch and Irish coasts. It would seem that the fishermen, like those of Brittany, are still devout, for many of their vessels are either christened after saints or bear such pious names as *La Volonté de Dieu*. Yet, on the other hand,

there must be a leaven of Republican opinion; for occasionally we remark an *Egbert* or *de Gambetta*, while *Paul de Cassagnac* on the stem of another shows that the champions militant of the Empire has a knot of admirers among the amphibious. These fishing folk must be generally well to do. You may see them, while preparing their nets or lines, sitting over very comfortable meals on deck; and the women are resplendent in earrings and other ornaments, and apparently grudge nothing to the laundress for the "get-up" of their linen on a Sunday.

Rubbing shoulders with these primitive natives, who seem to trouble themselves about nothing but their personal concerns, is the full rush of cockney and tourist life. Facing the quays which lead from the railway-bridge to the handsome buildings of the Casino, is a line of hotels in an ascending scale of excellence, flanked at either end by establishments of the first rank. Between the "Christol" and the great Imperial Hotel are many houses that must be cheap, and perhaps in some cases by no means nice. They advertise themselves by *salles-à-manger* looking out upon the street, where the guests dine by brilliant gaslight with blinds never drawn down. The parties are merry rather than select, for the travelling Englishman seems to be shaking off his unsociability, and rather inclining to fraternize on slight provocation. A short stay in one of these places ought to be an excellent education for the novelist who desires to study middle-class manners in their humorous aspect; but, if he wished to make himself at home with original types of character, we should advise him to push his researches into the boarding-houses, though it may be a question, now that quotations run low in the novel market, whether the game would be worth the candle. As the chief hotels stand near the quays, the boarding-houses are situated mainly in the back streets; and, traversing these by the spacious thoroughfare of the Grande Rue, you climb to the quarters of the resident English and the picturesque heights of the old town. The Grande Rue, with the animated fruit and vegetable market held under the shadow of the rather effective church, must be one of the steepest streets in Europe with similar pretensions. And it mounts to a sort of Kremlin or Bala Hisar, where churches, municipal buildings, huge convents turned into schools, in a network of narrow streets and lanes, with quaint, lofty, and tumble-down houses, are girt by venerable fortifications which have been converted into shady promenades. In fact, the promenades are only too shady, for the trees have been left unthinned, while the walks have a somewhat neglected air. But on all sides the views are extensive, and towards the sea they are superb. Landward the country is bleak and bare, though here and there are patches of weather-beaten wood in some half-sheltered valley, surrounding an old château with its farm buildings that reminds one of Hugoumont. And eastward is a succession of commanding heights, several of them crowned with hamlets and imposing-looking churches. As for the air of Boulogne, there can be no two opinions. It is invariably fresh and extraordinarily invigorating, which is the reason, perhaps, that the inhabitants are so careless of sanitary considerations. The drainage is abominable, and for the most part superficial; were it not for the steepness of many of the streets, it is certain that the death-rate would be a heavy one; and the smells, especially in the harbour at low water, must be nearly as offensive as those of Cologne which Coleridge has commemorated. By choosing the situation of one's hotel judiciously the scents may be almost or altogether avoided; but it is to be remembered that Boulogne is a watering-place in the rough, and that the invalid must not expect English luxuries there. There are few comfortable carriages, and only one or two bath-chairs, partly, perhaps, because there is no smooth paving or regular promenade on which the chairs might be drawn.

#### THE REVENUE RETURNS.

THE Revenue Returns for the first half of the financial year, which ended with September, are very satisfactory. It is curious how long it is before changes in the condition of trade begin to tell upon the yield of the taxes. The improvement in trade has been going on for exactly two years, and yet it is only now that we can say the old elasticity of the revenue is returning. The reason, however, is not far to seek. The early stages of a trade revival are marked less by a rise in wages than by an increased demand for labour. Work can be had by all who seek for it, but the rate of remuneration is little higher than it was before. The great majority of workpeople who had continued in steady employment all through the depression earn very little more than they did, and consequently have not the means of spending more; while the newly employed have many calls upon them which they must meet before launching out into increased expenditure. The young and enterprising emigrant, retaining a vivid sense of the hardships they have suffered, they use the turn of luck to betake themselves to new countries where they hope to find freer scope for their energies. Those who stay at home have probably incurred debts to the small tradespeople with whom they deal, and these have to be paid off before they can indulge in increased outlay. Probably, also, their wardrobes have to be renewed, and furniture which has been parted with in the bad times has to be replaced. Moreover, the difficulties they have just gone through leave a salutary impression behind, and it is some time before they venture into extrava-

gances. For all these reasons the early stages of an improvement in trade are not marked by a great increase in the consumption of the masses of the population. It is not until wages rise decidedly that ignorant men, finding themselves in possession of incomes to which they are unused, indulge in extravagant outlay. This will come by and by, no doubt; but up to the present there has been no great increase of wages. Here and there the wages of certain trades have been raised; but, speaking of the country generally, the rise in wages has been slight. There is consequently no room for such expenditure on the part of the working classes as was witnessed in the inflation years that followed the Franco-German war. But, at the same time, the steady employment of the working classes generally at fair wages enables them to consume taxable articles more largely than they could do when many of them were living precariously by means of odd jobs; and it is this gradual increase in the consuming power of the masses which we are now feeling, and which will doubtless go on making itself more sensibly felt for the next few years.

For the half-year which ended with September we find an increase in all the items of revenue which are derived from taxation proper. The only decreases occur in Miscellaneous, Interest on Advances, and Crown Lands. Miscellaneous is composed of so many and such heterogeneous items that it is impossible to infer anything either from a decrease or an increase. As a matter of fact, this source of revenue has been decreasing since the 1st of April. In the past three months it has fallen off 195,861*l.* compared with the corresponding quarter of last year; and in the six months it has fallen off 250,440*l.* In the last three months, therefore, the decrease has been in a greater ratio than for the six months; but, as we have just said, the item is so heterogeneous that it is impossible to found any inference upon it. Interest on Advances, again, shows a decrease of 1,565*l.* for the half-year, but it likewise gives us no indication of the condition of the population. And Crown Lands show a decrease of 15,000*l.*, the whole having occurred in the last three months. On the other hand, all the revenues derived from taxation show increases for the half-year. Under the head of Customs the increase is as much as 256,000*l.*, and of this amount 150,000*l.* is in the last three months, showing that the increase has gone on augmenting as the year advanced. Under the head of Excise, again, the increase for the quarter ended with September is as much as 865,000*l.*; but, as there was a heavy falling off in the first quarter of the year, the increase for the six months is only 440,000*l.* Still it is noteworthy that the increase for the last three months has been so large as 865,000*l.* If this rate of augmentation is maintained until the end of the year, the increase under the head of Excise for the whole year will exceed the two millions at which Mr. Gladstone estimated it in his Budget statement. It would be rash, however, to speak too confidently upon this point. It will be in the recollection of our readers that, in his first Budget on returning to office, Mr. Gladstone substituted a Beer-tax for the Malt Duty, the substitution taking place on the 1st of October last year. As yet, therefore, we are comparing a new tax, of which we know very little, with the old tax for which it was substituted; but it is notorious that the Malt Duty came in irregularly. It was the custom of the Board of Inland Revenue to grant maltsters some time to pay the duty, and, in consequence, in some weeks very little was received, while at other times the receipts were very large. But the Beer-tax, as Mr. Gladstone has told us, comes in regularly all the year round. We must not assume, therefore, that the increase of 865,000*l.* under the head of Excise, which occurred in the last three months, will be continued during the remaining six months, when we shall begin to compare the receipts of the Beer-tax with the receipts of the same tax last year. At the same time very heavy drawbacks had to be allowed when the tax came into effect last year, and these will not be made this year. It is probable, therefore, that the increase may continue, and may even be larger than it has been up to the present time. But as yet it is only prudent not to be too sanguine. We have had too little experience as yet of the working of the Beer-tax to form any confident opinion respecting it. The safest way to judge of the consumption of the country is to lump both Customs and Excise together. If we do this, we find for the past three months an increase under the two heads of 1,015,000*l.*, and for the six months an increase of 696,000*l.* These are certainly satisfactory figures, and prove beyond a doubt that the consuming power of the masses of the population is rapidly increasing. Stamps, again, show an increase for the six months of 225,000*l.*, and for the three months of 125,000*l.* Here, again, the increase is slightly greater for the quarter than for the half-year; but possibly a portion of it is due to the speculation which has prevailed upon the Stock Exchange of late. Land-tax and House Duty show an increase of 10,000*l.* for the half-year; but for the quarter they exhibit precisely the same decrease. Property and Income-tax again show an increase for the six months of 460,000*l.*, and for the three months of 75,000*l.* These figures are not the least satisfactory of all that we have to notice. In his last Budget it will be remembered that Mr. Gladstone remitted the additional penny which he put on last year. We are therefore comparing the receipts of Income-tax now with the receipts at a higher rate last year, and yet, as we see, during the past three months the result is an increase of 75,000*l.* In the first quarter of the current year no doubt the increase in the receipts was due to the fact that arrears were then being collected at the higher rate of last year, whereas twelve

statistics previously published were collected at the same rate, but during the past three months very few reports properly remained to be collected, and the figures are therefore at the rate of the current year. The Post Office, again, shows an increase of 1,12,000 for the half-year, and of 25,000 for the quarter, and the Telegraph Service shows an increase of 25,000 for the half-year and of 5,000 for the quarter. These two items, taken together, show a very quick, and, perhaps, changes in the condition of the population, and the considerable increase which they exhibit, particularly in the last quarter, is therefore encouraging.

The net result is an increase for the half-year of 1,260,995, and for the quarter an increase of 1,121,085. It will be seen that practically the whole increase has been obtained during the past three months. The bad weather of January and March, which checked trade so seriously and to some extent stopped out-of-door employment, apparently told very heavily upon the revenue, and its effects continued into the first quarter of the current financial year; but since the beginning of July the augmentation of the revenue has been very great, and, as we see, has extended over all items of taxation proper. It is fairly to be assumed that this increase will more or less continue. It has gone on gaining strength as the year has advanced, and there is no reason that can be seen why it should now diminish. On the contrary, all experience leads us to expect that, as the improvement in trade grows, the effect upon the revenue will become greater and greater. As we have explained, in the first year or two the improvement is scarcely felt; but when once it begins to be felt it tells rapidly, and, gaining strength, continues to swell the receipts for several subsequent years, even after the trade improvement itself has received a check. No doubt the bad harvest can hardly fail to have an unfavourable effect on the revenue. The agricultural classes generally being badly off, and being unable to spend as largely as usual, the result must show itself in the revenue. But this apparently will only be to prevent the growth of the revenue from being as rapid as it otherwise would be, not to prevent growth altogether. The increased productiveness of the taxes which these returns show only corroborates the evidence presented by all available statistics that trade is improving, and is likely to improve still more rapidly for the remainder of the year. And if trade continues to improve, the consuming power of the population will grow, and will increase the productiveness of the taxes.

#### OPERA AT THE LYCEUM.

MR. HAYES'S autumn season of opera at low prices began last Saturday at the Lyceum Theatre with the performance of Meyerbeer's opera of *Dinorah*. The great feature of interest was the reappearance of Mme. Marie Marimon on the London stage. After an interval of three years, this charming singer has once more assumed the part of the half-witted peasant maiden Dinorah; and, although her voice gave some evidence of wear, her execution of the extremely difficult music which the composer has written for the part was as precise as ever, while her acting was, even more than before, true to nature. The part of Dinorah requires a true actress to give it any interest; and as, unfortunately, many of the best singers are but poor players, the part has lost in interest, and attention has been attracted merely to the music. This, of course, may be said of a large number of other operas; but in the case of *Dinorah* the matter is of vital importance. Mme. Marimon, though a little nervous at first, threw herself into the part of the poor crazed girl with complete feeling and understanding. The scene in the first act with Corentin, with its curious inconsequential alternations of joy and grief, was finely realized; and in the "shadow dance" scene—where, by the by, she really sings to her shadow, and not to the audience, as nearly every other singer does—Mme. Marimon's acting was full of pathos. It is perhaps too much to expect that the English public will forego what they now claim as a right—we mean the encore; but if anything was required to prove the absurdity of re-demanding any particular part of an opera, the encore demanded on Monday night, would be alone sufficient. Imagine Mark Antony repeating his address over the body of Cæsar, or Hamlet his soliloquy, at the request of an uproarious minority of the audience, whose acquaintance with Shakespeare is limited perhaps to those two speeches, and you have a parallel as absurd as the repetition of "Sei vendicata assai" in the opera of *Dinorah*. Yet Signor Padilla was forced to repeat it, though, to his credit, it was noticeable that he seemed somewhat unwilling to do so. This singer, although he appears for the first time in London, is well known at La Scala in Milan, and is likely to prove an acquisition to the opera at the Lyceum. To a fine baritone voice he adds considerable experience of the stage, and has a good presence. As Hoel he gave evidence that he was capable of acting much worthier parts, and showed that he was not above studying detail. The scene which led to the re-demand of "Sei vendicata assai" was finer in its acting than in its singing, which was somewhat strained. Signor Padilla has two faults, which we hope he will soon correct. It is not at all necessary to use the full force of his voice, which is very powerful, in such a house as the Lyceum; but this is perhaps natural in one who has been accustomed to sing in the larger theatres of the Continent, and such a mistake can easily be corrected. The other fault is due, perhaps, to his training as a singer. He has the pernicious habit of resting for an indefinitely long

time upon one note, at the sacrifice of all time or rhythm, which produces a far from pleasing effect, and at times is specially irritating. The tremolo, which last year was the principal fault amongst the singers in the autumn season, has as yet, we are happy to say, been conspicuous by its absence. With these exceptions, however, Signor Padilla's performance may be said to be a decided success. The part of the Goatherd fell to Mlle. Le Brun, a *débutante* of promise. Her voice, which is rather a mezzo-soprano than a contralto, is of a sympathetic quality, and has been evidently trained with great care, and she acted with intelligence. Signor Frapolli appeared as Corentino, a part which suits him well, and which he acted with commendable appreciation. Divesting it completely of buffoonery, he yet gave sufficient prominence to the comic scenes which fall to him. His voice sounded to greater advantage in the more limited Lyceum auditorium than at the Italian Opera, though it would be well for him to bear in mind that he is singing in a smaller theatre.

On Monday *Rigoletto* was performed, with Mme. Rose Hersee as Gilda. Mme. Hersee has been travelling for some time with an operatic company in the colonies, and the report of her successes naturally gave an interest to her reappearance in London. Her impersonation of the unfortunate daughter of the Court Jester was natural and impressive, and in one or two scenes, such as the love scenes with the Duke, and that in which she meets her father after her abduction, showed marked dramatic power. Her voice seemed at first to have lost some of its original vigour; but this, perhaps, was only due to the natural nervousness which even some of the greatest performers are liable to on a first appearance on a new stage, for later on it was as strong as was necessary for the Lyceum opera. To Signor Frapolli fell the part of the Duke, which he sustained with some credit, although he marred the effect of the great song in which Griguffi used to shine, "La donna è mobile," by a most unhappy piece of phrasing. With the exception that Signor Padilla's figure hardly suits the character, his performance of *Rigoletto* was as good a one as we have seen for some time. It would be hard to say in which special scene he was at his best; but we can commend his acting when his unfortunate daughter is telling him of her dishonour, and the outburst of rage, mingled with remorse at his own horrible conduct, which follows, and the savage desire of revenge in the quartet in the third act. His appeal to the nobles to tell him where his daughter is was also finely pathetic, and deserved the applause which followed. The faults which we have remarked upon above were still evident, though not so prominent as on Saturday night. Signor Ponsard played Sparafucile, and Mlle. Le Brun Maddalena. Of the former it is only necessary to observe that his intonation was anything but true. Mlle. Le Brun sang the part of Maddalena with considerable artistic skill.

The male portion of the chorus appears the weaker, and on the first night once or twice nearly succeeded in ruining the opera. One need not perhaps expect the chorus to be perfect at these representations; but a little more drilling would have a marvellous effect, and in every way improve the enjoyment of low-priced opera. That this is a fact is shown in the marked improvement to be noticed at the Lyceum over the performances at Her Majesty's last autumn, and the consequent appreciation of the public. Of the orchestra we cannot speak with unmixed praise. There was an unsteadiness and want of attack which spoke of insufficient rehearsals, and there was a weakness in the wind instruments especially which was very marked at one or two points in *Dinorah*. It is true that the space allotted to each player is very small. Signor Li Caisi conducted. The theatre during Mr. Irving's absence has been enlarged as far as the entrances and exits are concerned, and the comfort of the audience has been attended to by increased accommodation and a better system of ventilation.

We have often before insisted that opera at low prices and in a theatre of smaller dimensions than either Covent Garden or Her Majesty's would have an ensured success, and it bids fair to obtain it now at the hands of Mr. Samuel Hayes. Hitherto, certainly, looked at from a musical point of view, the autumn seasons have not realized our expectations, but there was ample reason for their failure. People will listen even to second-rate soloists provided they are supported by an adequately trained chorus and orchestra, and, though in the present instance we cannot say that either show marked excellence, they are, at any rate, much more up to their work than the similar members of previous companies have been. And, again, a singer reckoned as second rate at the larger theatres has at least one great disadvantage removed by the comparatively small size of a house like the Lyceum, and perhaps this may give him the confidence which is so necessary an element in all good acting and singing. Mr. Hayes's programme is a sufficiently modest one. There are no novelties promised and no great star singers paraded; but an ample, though ordinary, repertoire which has hitherto been very inefficiently provided to the public is promised, and we doubt not the promise will be fulfilled. There is also another great advantage in these performances—namely, they begin early and can therefore end at a reasonable hour.

## NEWMARKET FIRST OCTOBER MEETING.

THE Newmarket autumn racing season began in beautiful weather. There are perhaps few occasions on which racing can be more thoroughly enjoyed than on a crisp autumn afternoon on Newmarket Heath, especially when one is riding a good horse. Yet the man who determines to attend throughout the October meetings must make up his mind to bear some days, at least, of biting winds and driving rain. The first thing that racegoers found out on arriving on the course for the First October Meeting this year was that the fee for entering the Bird Cage had been raised from half a guinea to a sovereign. This "improvement" caused some grumbling, but we cannot see why the authorities should not charge whatever sum they think proper for admission to their own saddling paddock. We should hesitate to advise that the charge for entrance to saddling paddocks at other meetings should be raised, but at certain races the crowds in the paddocks are in these days so large, that it is next to impossible to see anything of the horses, and if an increase of the price of admission would reduce the crush, we should not complain. It might be better economy to pay a sovereign and get a good look at the horses than to pay half a sovereign and see nothing for it.

Ten days before the First October Meeting the Paris Omnium, or French Cesarewitch, had been won by Count F. de Lagrange's Innocent, who had carried a heavy weight and had beaten twenty-six opponents, winning in a canter by a couple of lengths. In the opening race of the Newmarket meeting this French hero had an opportunity of showing what he could do on this side of the Channel. He ran very well throughout the race, but within a stride of the post old Suttler just managed to catch him, and won the race by a head. It is but fair to say that Suttler, who has won seven races out of nine this season, was bred in France. After the race, the conditions of which obliged the winner to be sold by auction, Suttler was bought in by his owner for 1,070 guineas, and Innocent was claimed by Captain Machell at the price of 1,000l. The most interesting race of the day was the Great Foal Stakes, a prize worth 2,052l. The first favourite was Thebais, who had won five races this season without once suffering defeat. Among her victories had been the Oaks and the One Thousand Guineas, and she had won more than 10,000l. this year in stakes alone, to say nothing of something like 6,000l. which she had won last year as a two-year-old. Indeed she had hitherto been generally regarded as the best three-year-old of her year. She is a good-looking filly, and had shown considerable muscular development. Great, therefore, was the horror of her backers when they found, on her being stripped for the Great Foal Stakes, that she had lost her powerful muscular appearance, and looked weak and flabby. Nevertheless she continued to be the first favourite up to the start, as her public form gave her every right to such a position. The uncertain Scobell was second favourite, and Ishmael and Cameliard, who had been first and second in the Great Yorkshire Stakes, were respectively third and fourth favourites. Thebais made the running, but, when the struggle began in the Dip, she was the first of the leading division to give way, and soon collapsed so completely that she might have been no relation to the gallant Thebais who used to bound forward so boldly when challenged. When popular heroes are defeated, there are always plenty of people ready to depreciate them, and when Thebais was beaten for the first time this season, racing prophets suddenly recollected that this was the first time this year that she had been confronted by opponents of the opposite sex. We must not, while discussing the defeat of Thebais, forget the three horses who were fighting out the race. It was a severe struggle. Cameliard was leading, closely followed by Ishmael on one side and Scobell on the other. As they raced up the hill, Scobell gained a slight advantage, which he maintained to the end, winning at last by half a length. Ishmael made a rush, and got his head in front of Cameliard as the winning-post was passed. This confirmed the form of the pair in the Great Yorkshire Stakes, as they had been separated by exactly the same distance in that race. As Scobell has won more than 6,000l. in stakes this season, his career can scarcely be called a failure, but yet, after having been expected to win the Two Thousand, the St. Leger, and the Grand Prix de Paris, it must be admitted that he has been rather a disappointing horse.

Both Cameliard and Thebais were brought out again on the second day of the meeting for the Thirty-third Triennial Stakes. Thebais was so evidently out of form that it seemed surprising that she was backed at such a short price as 4 to 1, although she would probably have started at odds if she had been at her best. Only 11 to 10 was laid against Cameliard, who walked very stiffly after his race of the preceding day. The second favourite was the Duke of Hamilton's Fiddler. This horse had run several times as a two-year-old without winning; but this year he had only been out twice, winning one of his races. In his other race, the Craven Stakes, he had been a bad third to Cameliard; so on public form he now seemed to have little chance of beating the last-named horse. Yet Cameliard was evidently very leg-weary, and Fiddler had improved wonderfully in appearance since he had last run in public. The only other starter was Falkirk. Fiddler made the running, followed by Cameliard. At the bushes Thebais and Falkirk were beaten; but Cameliard went gradually up to Fiddler, who began to run like a tired horse. As they came up from the Dip, Fiddler kept struggling on with great gallantry, although Cameliard was ap-

parently overhauling him. As they went up the incline, however, Cameliard also began to show symptoms of having had enough of it, and when the pair laboured up to the winning-post, Fiddler was a head in advance of his opponent. This race was more interesting than might at first sight appear; for Fiddler is handicapped at 6st. 10 lbs. only for the Cesarewitch, a weight at which Cameliard would be considered, to use a racing phrase, "turned loose." When, therefore, Fiddler beat Cameliard at even weights, he was immediately installed as first favourite for the Cesarewitch. The Great Eastern Handicap, which was the principal race of the second day, was a very open affair. The large field of twenty-three horses started, and John Ridd, a 16 to 1 outsider, won very cleverly. There was a great deal of heavy gambling on a First Foal Stakes, for which a couple of fillies started. Very slight odds—11 to 10—were laid on Mr. Bowes's Blyskawica, but Prince Soltykoff's Merry News won, after a magnificent race, by a neck. The two fillies ran side by side throughout the race, and it was a mere question which of the pair could stay the longest.

The celebrated two-year-old filly Dutch Oven had walked over for the Buckenham Stakes on the Tuesday. Considering that she is one of the fastest fillies of the season, it was not surprising that no one cared to oppose her, as the entrance money for that race was 300l., half forfeit. On the Thursday, however, in the Triennial Produce Stakes, for which the entrance fee was only 10l., five other two-year-olds came out to oppose her. The conditions of this race were that the second horse should receive 10 per cent., and the third horse 5 per cent., of the stakes; so half of the six starters were certain to get something. More than 3 to 1 was laid on Dutch Oven, 4 to 1 was laid against Red Spectre, a filly that had won several races, and 25 to 1 was vainly offered against either of the other four starters. Dutch Oven won in a common canter, although Archer only allowed her to be half a length in front of Red Spectre. There might from appearances have been two races, for some little time after the leading pair had passed the winning post, two of the other horses came racing in for the 5 per cent. due to the third in the race. There was a capital race between these two aspirants for third honours, ending in a dead heat. The Newmarket October Handicap was won by Victor Emanuel, the winner of the Chesterfield Cup at Goodwood. By far the most interesting race of the day was the Grand Duke Michael Stakes. The favourite was Ishmael. Foxhall, the winner of the Grand Prix de Paris, was the second favourite. Now in the Grand Prix, Tristan had run Foxhall to a head, and in the Great Yorkshire Stakes Ishmael had beaten Tristan by five lengths; on public form, therefore, Ishmael seemed certain to be able to beat Foxhall in the Grand Duke Michael Stakes, especially as he was to be allowed 7 lbs. by the last-named horse. Yet, instead of being beaten by Ishmael, Foxhall won in a common canter by four lengths, Don Fulano being second, and Ishmael a bad third. As soon as the race was over Foxhall was made first favourite for the Cesarewitch, completely supplanting Fiddler, the newly-elected favourite of the previous day. So astonished were some people by Foxhall's victory in the Grand Duke Michael Stakes, that they began to doubt whether Iroquois could have done as much, and made it a question whether Foxhall might not possibly be the best three-year-old of the season.

The St. Leger Stakes was the opening race of the last day of the meeting. Although Ishmael had beaten Great Carle very easily at York, Great Carle was now made first favourite and Ishmael second favourite. In the Great Yorkshire Stakes the pair had met at even weights, but now Ishmael was to give Great Carle 7 lbs. Moreover, Archer was to ride the last-named horse. It turned out to be a very fine thing between the pair, but Ishmael just won by a head. Dutch Oven came out for the Rous Memorial Stakes. Nellie, who had beaten her at York, was to run against her once more. At York Nellie had had 7 lbs. the best of the weights, but now the two fillies were to meet on equal terms. Dutch Oven had the best of the race all the way; and, although she only beat Nellie by a neck, she really won with great ease. It only remains to add that the weather throughout the meeting was as fine as could be wished. It is seldom that four more beautiful days in succession are enjoyed at any time of the year in this variable climate.

During the week that preceded the First October Meeting the Cobham Stud was sold. Only a couple of years ago the Stud Company came to grief, and the stock was sold by order of the official liquidators. A new firm was at once got up to take the place of the defunct Company, and a large number of the horses and mares sold at the sale were purchased to remain on the farm. Among other lots the new firm bought Blair Athol for 4,500 guineas, and Wild Oats for 2,500 guineas. The entire proceeds of the sale amounted to more than 54,000l., and it was generally understood at the time that at least half that sum came out of the pockets of the new firm. The new Stud was of but short duration, for in the third week of last month it was rather suddenly sold without any reserve. The first day's sale brought in 15,000l. A couple of years before, the first day of the Cobham sale had produced 24,000l. Many of the mares at the late sale were old, but some of those that had been purchased at the previous sale were sold at an alarming depreciation. Eva, who had cost 1,600 guineas, went for 800, and Crinon, who had been purchased for 1,400 guineas, was sold for 730. The highest price of the day was that given for Jocos—1,500 guineas—but she had cost 1,750 at the former sale. On the second day things were still worse, the proceeds being under 9,000 guineas, a sum more than 20,000

guineas below that realized on the second day two years ago. Blair Athol looked well for his age, but a very exorbitant price could scarcely have been expected for a stallion nineteen years old. On the whole, 1,950 guineas seemed a fair price for him, although he had been purchased for 12,500 guineas about nine years ago. One thing that made the late sale at Cobham less remunerative than its predecessor was the depreciation in the value of foals. In 1879 one foal fetched the ridiculous price of 1,100 guineas; but the highest price realized by a foal at the sale last month was 400 guineas. The sire Wild Oats, who had cost 2,500 at the previous sale, brought in 2,000 guineas, and Cadet, who had cost 400, now went for 100. There was some spirited bidding on behalf of the Australians and New Zealanders. Blair Athol fortunately remains in England, but Wild Oats goes abroad. At the sales of blood stock at Newmarket, the prices obtained at the auctions were not high. A two-year-old, however, was privately sold for the good round sum of 2,000l.

## REVIEWS.

### ROSENTHAL'S PHYSIOLOGY OF MUSCLES AND NERVES.\*

IT is only within the last thirty years or so that the study of the physiology of muscles and nerves has assumed the character of a distinctive branch of science. Scattered facts and observations, the fruits of anatomical and histological inquiries, have within that time been correlated with the results of electrical research to an extent that gives a new and positive basis to what was before but a tentative or conjectural treatment of this important class of vital phenomena. The names of Weber, Du Bois-Reymond, and Helmholtz will be held in honour as those of the founders of this department of knowledge, which has found the first attempt at a connected exposition of its position and aims in the short treatise of Professor I. Rosenthal, of Erlangen, lately issued in an English version in the course of the "International Scientific Series."

Difficult as it is to explain the phenomena of motion and sensation, it is in them, our author premises, that we see undeniably the primary distinction between animate and inanimate objects, and, in the main, between animals and plants. For though in plants there occur movements similar in some respects to those of animals, as in *Mimosa pudica*, the causes of motion are found essentially distinct in the vegetable from those of the animal organism. No less distinguishable are the so-called Brownian or molecular movements of minute granular bodies, to be seen under high magnifying powers in the fluid portions of vegetable and animal tissues alike. This is not to be called a vital phenomenon in the same sense as the independent motion which marks the lowest rank of the organic world, the minute protoplasmic masses known as *amæbe*. In these we recognize one of the lowest forms of independent living animals. All living beings, moreover, are fundamentally composed of just such lumps of protoplasm as we see in the *amæbe*, and even in fully developed organisms separate parts occur which, in all respects, resemble these simple masses and move like them. An illustration of this is given by our author in the various forms assumed by the white blood-corpuscles in the blood of a guinea-pig. These at the temperature of live-blood exhibit active movements identical with those of *amæbæ*, which have in consequence been called *amœboid* movements. The corpuscles send out processes and retract them; they creep about upon the glass; they even absorb matter such as granules of any colouring substance drawn from the blood-fluid. They eat, that is, and they excrete. Each single form of this kind is in itself an elementary organism, or primary life-cell, whilst in the aggregate they build up a colony or society. The highest forms of plants and animals, in fact, originate out of a multitude of these elementary cells, developed in various ways by growth and nutriment, and differentiated by distinctive kinds of function. The powers of generating motion are proper to all forms of cell-life, to the simplest as to the most highly modified, but the modes of motion are various. What is known as ciliary motion is briefly explained before passing on to the main subject of the work. A microscopic section shows the delicate cilix with which portions of the mucous surfaces, such as the palate and windpipe, are densely studded, these perpetual vibratory movements propelling in a definite direction such particles as come in contact with them. In many fixed animals cilix of this kind produce a current which serves to bring the animal its food; in other aquatic animals they give the means of rotating in the water; whilst in some bodies their place is taken by a larger whip-like kind of process, by the sinuous motions of which the animal propels itself as a boat is moved by the quick motion of the rudder, or a water-newt by wriggling its tail. None, however, of these motions, our author goes on to show, equal in force, definiteness, or effect, those produced by muscles, the different forms of which in higher animal forms he describes as made up of smooth or striated fibres. The action of these fibres on the organism at large and the nervous system in particular is made clear in a succession of admirable chapters. Use is largely made of the ingenious mechanical contrivances introduced of late years

in aid of physiological research, muscular and nervous energy being thus brought within the scope of mechanical test and measurement. Amongst these are Du Bois-Reymond's apparatus for the study of elastic extension in muscle by means of a scale of weights, and the myograph or muscle-writer as simplified by Pfüger, in which a lever is made to trace the degree of elastic tension on a plate of smoked glass. Another contrivance for determining whether contraction does or does not take place is the muscle-telegraph, specially arranged by the French savant for experiments during his lectures in connexion with an induction coil. What he calls a tetanizing key is further used as a test of the muscle's action or enduring contraction of a muscle, as distinct from a sudden and spasmodic shortening or pulsation. By calculating the height to which a given weight is raised by a muscle when set in motion it becomes possible, on mechanical principles, to express in figures the amount of labour accomplished, the weight being multiplied together with the height to which it is raised. In fig. 15 is shown a scale resulting from a series of experiments thus made. To measure the sum of work accomplished by a number of separate pulsations, an ingenious apparatus has been invented by Herr A. Fick, which he calls a labour-accumulator (*Arbeitsammler*). At each pulsation a slight amount of muscular work is found to have been lost, having, it is thought, been converted into heat, which is shown by other experiments to be generated, as is also electricity, by every muscular exertion. Another interesting phenomenon is the audible sound or note given out by muscle when contracted in tetanus, though seemingly quiescent. A deep buzzing sound called the muscle-note is heard through an ear-trumpet. Helmholtz has shown that each irritation of the muscular fibre corresponds with a sonorous vibration; and by the height of the muscle-note, tested by what is called Wagner's hammer or an electric wheel, the number of irritations which are required to keep up a given amount of contraction may be determined. About eighteen or twenty vibrations per second seem to be the nearest approach to the normal muscle-note heard during voluntary contraction, which corresponds closely to that produced under the condition of tetanus.

Besides the audible creaking that science has been able to make manifest in the living machine, there are certain chemical processes involved in the operation of muscular contraction and excitation to which Helmholtz, Du Bois-Reymond, and other physiologists have given attention, though it is difficult at present to assign to them a quantitative value. Such constituents of muscle, for example, as are soluble in water are found to decrease under contraction, whilst such as are soluble in alcohol increase. An acid (probably a lactic acid, *Fleischmilchsäure*) is generated when the muscle is active. Quiescent muscles also contain a certain amount of a starch-like matter, called *glycogen*, part of which, as Naase and Weiss have shown, is used up during the activity of the muscle, being transformed into sugar and lactic acid. Our author adds the fact that carbonic acid is generated in the muscle by its contraction. All these chemical changes are capable of producing warmth and work, the amount of which it would be easy to indicate with suitable apparatus. We have, indeed, no adequate means of examining albuminous bodies, the chief constitution of muscle, or of appreciating the changes which go on in living tissues, subject, of course, to the universal law of the conservation of energy. With regard to the nitrogenous constituents, however, we have an approximate measure in the amount of excretory matter, which corresponds very closely to the amount of work performed. Some practical remarks of value are here appended by our author bearing upon the relation of food to muscular work. Most of the experiments upon which is based our knowledge of the structure and functions of muscles are necessarily worked out from portions of tissue after the general life of the animal is extinct. Not a few, however, of the most interesting phenomena are exhibited by operations upon the living body. Du Bois-Reymond's apparatus (fig. 56) indicates clearly the deflection of the magnetic needle by the mere will of the manipulator, an electric current being set up by the voluntary contraction of the muscles of one arm, the groups of muscles in the two arms when at rest being symmetrically arranged, cancelling each other. Muscles and nerves have an important difference from all other tissues of the animal body in the class of phenomena which they have in common, as regards the electric actions which proceed from them. Experiments with the galvanometer have done much towards assigning a quantitative measure to the currents involved in muscular and nervous energy. We may measure, on the one hand, the effects produced upon a portion of muscle or nerve when traversed by an electric current; or, on the other hand, the deflection of the needle under the action of living tissues, especially in the case of animals possessed of high electric organs, such as the torpedo. The altered condition of a nerve when artificially charged with electricity, called the *electrotonus* of the nerve, is discussed at some length by Dr. Rosenthal, his experiments resulting in the final law that excitement of the nerve depends on a change in its molecular condition, occurring as soon as such a change is effected with sufficient speed. The same law, he remarks, in all essential points holds good with muscle; but the molecules of muscle are more sluggish than those of nerve, transient influences having upon them but little effect. The electro-motive force in both differs not so much in kind as in degree, existing, in fact, not in animals alone, but in vegetable tissues, as Derwiz and Bardon Sanderson have shown in *Dionæa muscipula* and *Mimosa pudica*. Experimental proof is thus to be had of the degree to which such force is bound up with life itself.

\* General Physiology of Muscles and Nerves. By Dr. I. Rosenthal, Professor of Physiology in the University of Erlangen. With 75 Woodcuts. London: C. Kegan Paul & Co. 1881.

Our author has hitherto paid attention to such nerve-cells only as are in connexion with muscles, and by the activity of which the appropriate muscles are rendered active, referring incidentally only to other kinds of nerves. He proceeds towards the end of his book to consider how far the experiences we have gained of motor nerves and the views based upon these experiences are applicable to the vaso-motor and secretory nerves, and more particularly to the more complex and mysterious phenomena of the sensory nerves which, when irritated, give rise to sensations of light, heat, sound, and so forth. Whether these nerves are homogeneous in themselves with the kinds previously spoken of is by no means certain. Still harder is it to understand what are called the retardatory nerves (*Hemmungs-nerven*). The heart is commonly known as a muscle which beats ceaselessly during life. Yet if a certain nerve which enters the heart is irritated, the heart ceases to beat, its beat beginning again when the irritation of the nerve is discontinued. This remarkable phenomenon was spoken of by Weber, its discoverer, as retardation, a curious case of a nerve by its activity being able to still a muscle which is in motion. Now it is quite impossible, our author shows, to detect differences in these different classes of nerves, either by anatomical observation under the microscope or by experimental tests of any kind. In their bearing to irritants they are not found to vary, and the electro-motive effects are the same in all. We can only explain the difference in their action as due to their connexion with terminal organs of various form. From a series of thoughtful investigations into the phenomena of reflex nerve action in relation to sensation and consciousness, some valuable conclusions are arrived at which sum up briefly what our author claims to have made good:—

From all these details it is very evident that the nerve-fibres are homogeneous the one with the other, and that the difference in their effects is to be referred to their connection with nerve-cells of varied form. This seems, however, to be opposed to the fact that the different sense-nerves are irritable by quite different influences, and each of them only by quite definite influences—the nerve of sight by light, the nerve of hearing by sound, and so on. It would, however, be a mistake to infer from this that the nerve of sight is really different from the nerve of hearing. If the matter is examined more closely, it appears that the nerve of sight cannot be excited by light. The strongest sunlight may be allowed to fall on the nerve of sight without producing excitement. It is not the nerve, but a peculiar terminal apparatus in the retina of the eye with which the nerve of sight is connected, which is sensitive to light. The case of the other sense-nerves is similar; each is provided at its periphric end with a peculiar receptive apparatus, which can be excited by definite influences, and which then transmits these influences to the nerves. On the difference in the structure of these terminal apparatus depend which influences have the power of exciting them. When the excitement has once entered the nerve it is always the same. That it afterward elicits different sensations in us, depends again on the character of the nerve-cells in which the nerve-fibres end. Supposing that the nerves of hearing and of sight of a man were cut, and the periphric end of the former were perfectly united with the central end of the latter, and contrariwise that the periphric end of the nerve of sight were perfectly united with the central end of the nerve of hearing, then the sound of an orchestra would elicit in us the sensation of light and colour, and the sight of a highly coloured picture would elicit in us impressions of sound. The sensations which we receive from outward impressions are therefore not dependent on the nature of these impressions, but on the nature of our nerve-cells. We feel not that which acts on our bodies, but only that which goes on in our brain.

It is to the specific energy of the nerve-cells that we must refer the different sensations of which we are conscious. At the same time, we must guard against the idea that in the complex form in which these impressions now present themselves to our consciousness they are to be accounted for by such primary and direct action of the nerve-cell upon the sensory organs. It is only by continued experience, based upon the correlation of sensations, not only often repeated, but drawn from the specific action of more than one order of sensory motors, that our perceptions of objects outside us are built up. The impression of distance, for instance, is not gained directly from the action of the lens of the eye, and to an infant it is long unknown. We think we see a man a certain way off. Really, however, we only feel a picture of a certain size of the man on our retina. We learn to know by experience what is the average size of a man and how much the apparent size decreases with the distance. Moreover, we feel the degree of contraction of the muscles of our eye which is necessary to direct the axis of our eye to the object and for the adjustment of our eye to the necessary distance. From all these circumstances, our author makes it clear, the complex opinion which we erroneously regard as a direct sensation is formed. Upon fundamental facts such as these he is able, with reason, to contemplate the building up in the future of an experimental system of physiological psychology.

#### THROUGH CITIES AND PRAIRIE LANDS.\*

WE are not of those who maintain that a route, when once it has become well travelled, should never again be made the subject of description. So long as the traveller can bring a fresh and eager mind to the work, so long as he has a quick eye for all that is striking, and is well skilled in the art of telling what he has seen, he may be justified in writing an account of a tour that extended no further even than from London to Paris. Without these qualifications, however, he is sure to be dull, even if he has to tell of a journey from Timbuctoo to Tobolsk, or from Siberia to Siam. But when he invites us to accompany him on a familiar route where there is nothing in the subject to make up in some degree for his

deficiencies, then the result is disappointing enough. We have nothing to learn from him, for he has only been where thousands have been before, and he has nothing to tell that can satisfy us by the mere charm of its narration. He had not prepared himself for his travels by years spent in his study, and he had never learnt that it is one thing to scamper over a continent and quite another thing to write a book. To this class of travellers, we regret to say, the author of the volume before us belongs. She is one of those who may be said to run and write. She and her pen travel at a great rate and an equal pace. Her readers, with even the best will in the world to keep up with her, soon find themselves left far behind. For while she never rests, they are scarcely able for half an hour together to keep awake. Were it not for the happy power they have of making long and frequent skips, we greatly doubt whether they would not be left so far behind that they would utterly despair of reaching the goal that she sets before them. The title of her work is somewhat misleading. She certainly has been through prairie lands, for she has crossed the United States from the Atlantic to the Pacific and from the Pacific back to the Atlantic; but then she has travelled always in the steamship or the railway car. A traveller who went by train from London to Inverness might almost equally well describe his journey as one Through Cities and Fields, Moors and Mountains.

The book opens with Euston Square Station. Fortunately it takes but one page to bring us to Liverpool. There we find "the sun blooming, like a flower of light, in the bright blue skies." It was in July that the author started. Had it been in April the sun no doubt would have been budding, while in September we should have found it mellowing, or even dropping its leaves or petals. Why must a lady write nonsense merely because she goes to Liverpool on a fine day in summer? Not only was the sun blooming, but "the soft balmy air was laden 'with the briny kisses of the great sweet mother.'" Three pages later we come a second time upon these briny kisses and the great sweet mother, and that, too, though the sun was not, so far as we are told, blooming. But to return to Liverpool. The "stentorian lungs shouted 'all for the shore,' and departing friends and relatives swarmed down the steep wooden wall of the vessel." The wooden wall is, we suppose, a poetical flight, for it is of iron that the Atlantic liners are built. This, indeed, would seem to be implied a little further on, where the author writes about "our huge iron-hearted home." Perhaps, however, the iron heart is nothing but the engine and the boilers. Be that as it may, the vessel started and steamed majestically up (sic) the Mersey. This course ought to have taken it up to Warrington, and even to Manchester, but somehow or other it brought it into "the obnoxious Irish Channel." There, when night came on, our author writes, "we seemed to realize the fact that we were alone on the wide world of waters—the same living restless waters whereon Christ had walked, and whose waves he had bidden 'Peace, be still.'" Surely, if she does make the Mersey run up into the sea, she does not confuse the Irish Channel with the Lake of Genessareth. But her use of Scripture is at times peculiar. Thus she is describing how people of all nations meet in the streets of San Francisco. "We are jostled on one side," she writes, "by a Polish Israelite in whom there 'is no guile' with a long beard and high-peaked hat. A moon-faced Mexican . . . walks in his shadow." Just as many people now can never do anything simply "to the end," but only "to the bitter end," so Lady Duffus Hardy, it would seem, finds it difficult to mention the word Israelite without adding "in whom there is no guile." In another passage she describes an old priest who had the simplicity of a child. "Whether he possessed the 'wisdom of the serpent' I query—though how that interesting reptile has proved its claim to wisdom I fail to comprehend." But we must return from our digression to the voyage. "My first idea," she writes, "was to take a survey of my fellow-passengers. There were plenty of them; as a rule, they were mere common-place specimens of humanity, such as nature turns out by thousands, with no distinctive marks, but merely labelled 'men' and 'women.'" So pleased is she with this piece of writing, that she makes use of it again when she describes her fellow-passengers in a Pullman car. "As a rule, they are simply common-place, such as nature manufactures by millions and turns out merely labelled men and women, with no special characteristic except their sex." Poor things! they had never learnt to say that the sun blooms in July, or that a huge iron-hearted home steams up a river into the sea. They could even be content to see "the gilded glories of the saloon" without writing about them, nor could they have understood what our author meant when she wrote that she was "gliding calmly over the 'wild Atlantic waves,' which were rolling round us on all sides as far as the eye could reach, a world of palpitating waters, unruffled and smooth as the bosom of a lake."

When the ship is fairly out at sea, the sun, if it no longer blooms, at all events sets, as, indeed, it far too often does in this narrative. Did we not feel too kindly disposed towards our readers, we should inflict on them the seven sunsets which we have counted; for all we know, there may be some which have escaped our search. They are all cast very much in the same mould, and he who has read one will have just as much, or just as little, idea of what the author means as he who reads them all. The first is as follows:—

That evening we had a splendid sunset; the whole of the western skies were draped with crimson, lighted up with flames of gold. We watched its kaleidoscopic glories change; one brilliant colour fading into another

\* *Through Cities and Prairie Lands: Sketches of an American Tour.* By Lady Duffus Hardy. London: Chapman & Hall, Limited. 1884.

amalgamating with another, till the whole horizon was a gorgeous mass of rose-tinted purple and green and gold, which presently broke up, and drifted, and re-formed till the pale dim skies were filled with floating islands of fire.

In the second and fifth descriptions we have "a glory of crimson, purple, and gold, fading and changing, one colour amalgamating with another," and "feathery plumes of crimson, isles of amber, and pale amethyst cloudlets changing and amalgamating their gorgeous hues till they form one brilliant cavalcade of coloured glory." In the second, third, fourth, sixth, and seventh descriptions we have "gorgeous crimson plumes"; "a rapid mingling of amethyst and royal purple, like the jewelled mantle of some invisible King, with feathery plumes flying"; "the Western hemisphere draped with crimson clouds slashed with flames of purple light"; "ragged banners and broken bars of gold streaming through the darkening skies"; and "the western skies clothed with the barbaric splendour of crimson, amethyst, green, and gold." In spite, however, of the sunsets and of the author's fine words, we do reach America. In fact, measured by pages, her account of the voyage is really brief. But when we laud we do not find ourselves any better off than we had been at sea. A dinner knife and fork are, at the first meal on shore, called "eating utensils," and a song that was liked by a company of people is described as being "a mutual favourite." At Quebec "the air bristles with church spires, like drawn swords flashing in a holy battle, pointing upwards." That spires, whether at Quebec or elsewhere, should point upwards is nothing out of the common, but that things that bristle can be like things that flash is what is not easy to believe. From Quebec she goes up the St. Lawrence in a palatial steamer. She sees on the shore some Indians, and, when she looked on them, she "felt there might be some truth in Darwin's theory, after all." She takes a railway journey, and thus describes how the passengers passed their time:—

Meanwhile we amuse ourselves, each according to his or her fancy. One woman sucks oranges all the way, another "clucks" and makes zoological noises to amuse her rebellious offspring; the young tourist looks unutterably bored, and plays the "devil's tattoo" on the window; somebody perfumes the car with the odour of peppermint drops. The old ladies enter into a conversational race, and discuss their private affairs in a most audible voice, taking the whole car into their confidence.

The author travels in the States, and at night passes the Alleghany Mountains, "which on this occasion wear a crown of jewelled flames leaping in lurid fury upon the dusky night." She arrives at Chicago, and goes to "a palatial hotel, built by Mr. Potter Palmer, for the luxurious entertainment of the travelling public. . . . Each suite of apartments is . . . richly curtained and carpeted, with luxurious lounges and the easiest of easy-chairs. . . . The spacious halls and corridors are furnished in accord with other portions of the house." She goes to Salt Lake City, and hears "the low flute-like wailing voice of the *vox humana*" of a big organ. The voice of a *vox*! She arrives at San Francisco, and finds there a kaleidoscope company that makes up an incongruous gathering. Moreover, "every crustaceous delicacy the sea affords is there, all ready to tempt the appetite of omnivorous man." She drives through "a silent sea of yellow sandhills, smooth and soft as velvet, billowing round in graceful, undulating waves." For all we can see, she might just as well have written "a smooth sea undulating round in billowing waves," or "waving round in undulating billows," or "undulating round in waving billows," or "waving round in billowing undulations." There she breathes "the crisp, soft air, laden with three thousand miles of iodine." A few chapters further on she again breathes "the briny breeze, laden with three thousand miles of iodine." She describes the Chinese quarter of San Francisco. "The very bowels of the earth, it seems, are riddled and honeycombed by these human moles, who, like the ghost of the murdered Dano, can 'work in the dark.'" The metaphors are somewhat confused—bowels riddled, and at the same time honeycombed, by human moles who are like a ghost. The word *mole*, no doubt, suggests Hamlet's father. Our author, we assume, means to quote from the line "Well said, old mole! canst work i' the earth so fast?" She pays a visit to a lady, and is shown "her poetical kitchen, with no signs of prose about it." In one corner was a stove with bright brass knobs, "polished to the highest point of polishing, like a black prince with 'gilded honours thick upon him.'" His fiery eye was closed; he had done his work, and was at rest. From the bowels of this gnome had been conjured the dainty repast which awaited our attack." Has any one's dinner ever before come from the bowels of a gnome that was like a black prince, with one fiery eye, and that closed? She passes into Colorado. "It is now the 12th of April," she writes; "there is a bright blue sky, warm, balmy sunshine . . . but there is not a flower to be seen, nor the twitter of a spring bird to be heard anywhere." Five pages later on she writes:—"The skies are intensely blue, the air flooded with sunshine. Not the twitter of a bird is to be heard, not a tree in leaf, not a flower in blossom, and it is late in April." She goes to Washington. Its founder's design, she says, "has resulted in the production of one of the finest residential cities in the world." She describes the Capitol, "high and mighty in its pure architectural glory," and tells how its "beautiful white dome, with its graceful spire, is silhouetted against the bright blue sky." She goes to see Mount Vernon, where she finds living in the slave quarters the descendants of the slaves of the Washington family. "They are," we learn, "a very superior and obliging class of people; and provide

an excellent lunch for visitors, at a very moderate cost." She sees an electric machine "surrounded by scintillating sparks of weird greenish light, playing round it as though some fiery genie was confined therein." Even if there were a dozen fiery genies confined we do not know why their sparks should be scintillating. It would be just as reasonable to say that their scintillations were sparking, if there happened to be such a word.

Her American tour ends where it began, in Quebec. She sees those spires that a year before had pointed upwards now "gilded, pricking the pale morning sky." She embarks on the steamship, and finds "the decks swept and garnished for the advent of the coming passengers." Decks used to be swabbed and holystoned in the old sea-novels. But the writers had not Scripture terms at their fingers' ends, or no doubt theirs, too, would have been swept and garnished. We doubt, however, whether they would have gone so far as to fall into "the damnable iteration" of "the advent of the coming passengers." We are, at all events, under one obligation to our author which we hasten to acknowledge. She parts with us an hour afterwards as the ship steams down (not up, as if it were the Mersey) the mighty St. Lawrence. She might have kept us till the close of the day, and described her eighth sunset. As some return for the mercy shown us, we gladly acknowledge that her book is likely to be much enjoyed by that large class of readers who trouble themselves but little about a writer's meaning, so long as they get a big supply of fine words, with just enough sense in them to satisfy their notions of propriety, and not so much as to tire their understandings.

#### WATSON'S KANT AND HIS CRITICS.\*

WE know nothing of the constitution or condition of the Canadian University in which Professor Watson is a teacher; but if all its chairs are as well filled as that of Moral Philosophy the learners can have little to complain of. The present work is, to our mind, decidedly the best exposition of Kant which we have seen in English. We do not commit ourselves to placing Professor Watson above Professor Green or Professor Caird in actual philosophical power. But we do think his manner and method are more lucid than theirs, at any rate with respect to the reader who approaches the Critical philosophy from the point of view of English psychology. And, since a considerable proportion of English readers of such works may be expected to meet the writer from that point of view, the fitness of the exposition for the instruction of such readers is a material element in determining its merit. In trying to give an account of Professor Caird's work on Kant when it came out we felt ourselves swimming in an ocean of Anglo-German or German-English transcendental terms, with islands of solid ground standing out here and there, or perhaps we should say rafts floating and spars drifting, *vari nantes in gurgite vasto*. With Professor Wilson we feel on solid ground almost always, though it may be steep. There were many passages of Professor Caird's where we felt points of sympathy without being able to take firm hold of them. We could have agreed with him if we had been quite sure what he meant. In Professor Watson's criticism we find many points of definite agreement, and more of common understanding as to the nature of the questions in issue, which may sometimes be quite as important as a final agreement, or even more so; for what look like the same conclusions in philosophy may turn out to have been reached by radically different methods.

Professor Watson's general position may be not unfairly described by saying that he is more Kantian than Kant himself. He holds that Kant made a great advance in metaphysical method, and that English philosophy, on the whole, has not yet come abreast of Kant, but remains in the bonds of dogmatism which, for those who take the pains to understand him, Kant has shattered once for all. And this applies to the empirical school as much as to any other. For empiricism, in so far as it holds itself out as a substitute for critical analysis, is only dogmatism in a new dress. Accordingly, Professor Watson takes certain English writers as representing the sceptical and the empirical views, and maintains in detail, as against their objections or systems, the necessity and the value of Kant's work. This part of the book, though in form a critical examination of what is said in opposition or rivalry to Kant by Mr. Balfour, Mr. Sidgwick, G. H. Lewes, and Mr. Herbert Spencer, amounts to an exposition of Kant's theory of knowledge for the special benefit of readers whose philosophical training has been chiefly in the English school. If this were all, the work would be well worth doing, and being, as it is, faithfully and lucidly done, would be worthy of praise; and this whether we agreed with Kant and Professor Watson against the critics in question or not. For we must admit in any case that the method of Kant deserves to be understood, and that the student who has not attained some understanding of it is without the key to modern philosophy. This we say for those who believe that philosophy is a serious study, having a continuous history and a real development. Philosophy has its circle-squarers as well as geometry, and we may go a wool-gathering after them if we like. Some few years ago a Mr. Kirkman, because he knew some mathematics (probably no more than Kant knew, after all), and

\* *Kant and his English Critics: a Comparison of Critical and Empirical Philosophy.* By John Watson, M.A., LL.D., Professor of Moral Philosophy in Queen's University, Kingston, Canada. Glasgow: James Macdhouse. 1882.

had somehow hit on a kind of crude form of Fichte's Absolute Idealism, thought himself qualified to prove Kant a "maker of metaphysical mud pies"; for which and other like feats he was proclaimed a notable philosopher by Cardinal Manning. But life is too short for the discussion of such vagaries. To return to Professor Watson, the expository part of his work, good as it is, is by no means all. He goes on to speak on his own account, and has much to say that is well worth hearing. In his exposition there are hints and anticipations of coming criticism, which, however, is studiously reserved. Once free to criticize, Professor Watson tells us how much of Kant's work he thinks imperfect, and why. He holds that Kant did not fully apply his own method; that, coming out of the bondage of dogmatism, he was forced to use its instruments, and unconsciously remained under its influence in many particulars; and that the *Critique of Pure Reason*, especially the theory of knowledge, is no complete and harmonious system, but the embodiment in stubborn matter of a spirit by whose help Kant's successors may, and must, freely correct the letter. Just as it was impossible for Descartes to free himself at one bound from the Schoolmen, so it was impossible that remnants of dogmatism should not cling about Kant. In such cases Professor Watson would have us not seek for refined defences, and invent saving distinctions, but appeal frankly from Kant's shortcomings to Kant himself. This is the true and fruitful way of studying philosophy; not to get a master's doctrines by rote, but to grasp his ideas at the centre and test by them, if need be, his own results. Professor Watson's plan, then, is twofold; first to lead the reader up to Kant's point of view, taking Kant's doctrine, provisionally, as we find it; and then to encourage him to stand on Kant's shoulders and see as much more as he can. An advantage of this plan, besides those we have already mentioned, is that we are not left in doubt (as Professor Caird now and then left us) whether we are to read the text as a statement of Kant's actual doctrine, or of what his doctrine, if consistent, ought to have been.

Professor Watson begins the first or defensive part of his work by taking up Mr. Balfour as the champion of pure scepticism. It will be remembered that in his *Defence of Philosophic Doubt* Mr. Balfour set his hand against every man with delightful vigour and impartiality, and against Professor Green and Professor Caird among others. Professor Watson's main point in reply to Mr. Balfour is that it is not the business of philosophy, as conceived by Kant, or as it ought to be conceived, to prove in any ordinary sense the truth of either our common knowledge or the contents of special sciences. Philosophy is not the acquirement of new possessions, but the analysis of that which is already possessed in experience. "Kant invariably assumes the truth of the mathematical and physical sciences, and only asks how we are to explain the fact of such knowledge from the nature of knowledge itself." This point is in itself a thoroughly sound one, and it is of the first importance that it should be explicitly made by teachers of philosophy, and clearly apprehended by learners. We have not room to consider whether Mr. Balfour's criticism is thereby completely and at all points disposed of; nor, indeed, would this be much to our purpose. The victory is to both parties, for Mr. Balfour has done well if he has done no more than give an adequate occasion for expounding a leading principle. In like manner, we shall in other cases care more for what is made good for its own sake than for what may be made good controversially as against this or that opponent. The critical or analytical conception of philosophy—or, as we prefer to say, metaphysic—exposes it to the preliminary question of common sense. If metaphysic does not add to the contents of our positive knowledge, what is it good for? This is a serious question, and must be faced; but there is, as we hold, a complete answer to it. Reduced to the shortest possible terms, the substance of this answer is that at worst metaphysic is good to prevent us from taking false knowledge for true, on the one hand, and being scared by false limitations of our knowledge on the other. In other words, if the value of metaphysical criticism should turn out to be purely negative, its value is great notwithstanding. Kant's masterstroke is to have put this critical function of philosophy on an assured footing. That is his established achievement and title to greatness. Whatever else of his work may stand or fall, this will not fall. The extent of Kant's success may be measured in one direction by the diminution since his time of the estrangement between the transcendental and the empirical philosopher. So long as man's knowledge of the world was regarded as something that came to him ready made, and philosophers disputed whether it was from the inside or from the outside, there was not much prospect of even a rational agreement to differ. Kant taught us to regard knowledge as something constantly in the making, a function of the activity of the mind which transforms the first impressions of sense into an orderly world. He developed, in Professor Watson's words, "the theory that intelligence constitutes known objects instead of passively apprehending them." The proposition thus stated would have been denied by the empirical philosophers of the eighteenth or early nineteenth century. We doubt, however, if any competent empiricist would categorically deny it now. He might deny it with an explanation, as by saying that he does not admit it in the transcendental sense. But an absolute denial would be at least misleading, seeing that in modern psychology the constructive activity of the organism in sensation is a well-established fact. Our whole and continuous experience is demonstrably built up out of broken and discontinuous impressions. We see more than falls on the eye, and hear more than falls on the ear. This

working up of the raw material of sense belongs, of course, to a different sphere from Kant's analysis. It is held by Mr. Shadworth Hodgson and Professor Watson that Kant erred precisely in carrying over into the region of pure analysis things which belong to psychology and are capable of scientific determination. Yet even Kant's philosophical error, if such we count it, contains no small argument of his scientific precience. And it is something towards the reconciliation of the natural history of knowledge—"Physiologie des menschlichen Verstandes," as Kant aptly called it—with its metaphysical analysis, that the conception of knowledge as an active process is familiar to students in both kinds.

Professor Watson goes on to discuss with Mr. Balfour and Mr. Sidgwick the Kantian theory of *a priori* conditions of perception, and in particular the "Refutation of Idealism" in the *Kritik*. On the whole, we agree with Professor Watson's interpretation; but we cannot be surprised that conflicting views are taken. Kant is obscure both in the conduct of his argument and in his use of language. The *Ding an sich* which, as he maintains, is postulated by the mere fact of self-consciousness, is an ambiguous term. We think, as Professor Watson does, that it means not a *Ding an sich*, but a thing within the field of possible experience, not something unknowable, but something knowable. In that case, however, Kant does not refute Berkeley's idealism; for Berkeley never denied the reality of external things in that sense, or said that experience was possible without them. Kant's speculation goes beyond Berkeley's, but does not contradict it. And all that his argument really proves, assuming its validity, is that in order to constitute real experience there must be some constant form of perceptions besides time. In other words, we cannot conceive of conscious beings whose perceptions are under the formal condition of time alone; but we are free to conceive of beings whose perceptions are under the conditions of time, and of something else not imaginable, though conceivable, by us, which is analogous to space. The conception of higher dimensions of space itself is in much the same case. Thus Kant implicitly establishes a generic distinction between Time and Space which, so far as we are aware, he nowhere else pursues. The more general features of Kant's theory of knowledge are well stated by Professor Watson in the following passage:—

The dogmatist, while assuming that our knowledge is absolute or real, yet imagines that it can be obtained by means of mere conceptions; the sceptic maintains that conceptions cannot possibly yield reality, and hence he denies that there is any absoluteness in knowledge. Kant agrees with the former that we have a knowledge of actual existence, and with the latter that from conceptions as ordinarily understood no explanation of the possibility of such knowledge can be given. Evidently, therefore, the reality or absoluteness of knowledge must be preserved by showing somehow that there are conceptions which do not lie apart from real objects, but are essential constituents in them. But to do this we must change our view at once of the nature of real things and of the nature of conception. The transformation is partly effected in the *Ästhetik*, where it is shown that known objects are not things in themselves, but are relative to our consciousness. Existence and knowledge thus begin to come nearer to each other. If the existence that is real is existence in and for consciousness, things may be real and may yet be relative to our knowledge.

"The existence that is real is existence in and for consciousness"—such is the fundamental truth of metaphysic seen by Kant, but seen only in part. But we must not anticipate Professor Watson's *metaphysic*.

One of the most interesting chapters is that on the Relations of Metaphysic and Psychology, where G. H. Lewes's theory of knowledge is discussed. The criticism comes shortly to this:—that Lewes's doctrine, when all is said, is a newer and more elaborate form of the old endeavour to make psychology, which is a special empirical science, take the place of metaphysic, which is the general analysis of knowledge itself. It is a natural history of the growth and processes of knowledge in the individual, and, as such, a great deal of it is very good. But it is a natural history of events taking place in a world assumed to be already known; "it has no occasion to ask how knowledge is possible." We find in the individual certain organic conditions of sensation and knowledge, and these may be said to explain, for scientific purposes, how *his* knowledge is possible. The metaphysical problem remains just where it was. You may reduce the scientific expression of the process to a function of certain elements, and you may call those elements, or the complex arrangement of them which gives the function in its simplest form, by the name of "sentient material," or what else you will. You may use materialist or spiritualist language according to your convenience. But you have constructed a scientific hypothesis, not a metaphysical one, neither have you banished metaphysic. Kant is waiting for you still, and you must begin with him again at the beginning, or improve on him in his own line if you can. The conditions of perception we find in the individual organism, as matter of observation and experience, may correspond in some sort to the general conditions of knowledge which Kant finds analytically in consciousness. But this is no more than on Kant's view we might expect. Kant fully recognized the value of empirical psychology, and had no intention of supplanting its work by short cuts *a priori*. The *Critique of Pure Reason* "is an exposition of the constituent elements which we may logically distinguish in knowledge, not an account of the order in which our knowledge is developed in time." We must admit, however, that Kant is not steadfast to himself in this. It is difficult to follow his construction of Categories and Schemata without the impression that he does regard the human mind as a machine with "faculties" for its working parts, and thinks he is describing the actual process by which it makes knowledge out of

the materials wherewith it is fed by the senses. But such a description is psychology, not metaphysic; and if and so far as Kant aimed at such a description he failed, as his method was psychologically worthless. For psychology as a science the Categories and Schemata are merely fantastic machinery, and of no more service than the crystalline spheres of Ptolemaic astronomy.

Professor Watson's criticism of G. H. Lewes is equally valid, in its main points, as against Mr. Herbert Spencer; but Mr. Spencer's view of nature is the subject of a separate argument. And, considering how many English and American students take their philosophy chiefly from Mr. Spencer, this is by no means superfluous. By way of introduction Professor Watson gives an account of Kant's "Metaphysic of Nature" (*Metaphysische Anfangsgründe der Naturwissenschaft*), a work that goes over much the same ground as Mr. Spencer's chapters in "First Principles" on the ultimate conceptions of physics. We have no difficulty in allowing that in these matters Kant is far more satisfactory than Mr. Spencer. In some points he anticipated the latest methods of scientific exposition, as in making a special department of the science of pure motion under the name of *Choronomy*, which corresponds exactly to the *Kinematic* of our present masters in physics. But as to Mr. Spencer we must demur to the statement that his "theory may be taken as representative of all that is most valuable in the empirical philosophy of nature of the day." Professor Watson would have some difficulty in finding any person competent in mathematical physics, of whatever school of philosophical opinion, who would consent to be represented by the doctrine of "First Principles." Two or three eminent mathematicians have criticized Mr. Spencer pretty sharply on his "Persistence of Force," which, whatever it may be, is not the Conservation of Energy which is known to science. This appears to have escaped Professor Watson's notice, otherwise he would hardly speak of the "persistence of force" as if it were an undoubted scientific truth.

As to Mr. Spencer's philosophical explanation, Professor Watson contends that he assumes the thing to be explained. Mr. Spencer derives the notion of time from experiences of sequence, and the notion of space from experiences of co-existence. As an account of the production of the concepts of time and space in this and that particular intelligence, this may be very well. But in describing individual experiences of sequence and co-existence, we assume the real existence of a world independent of intelligence, or at least of any particular intelligence. We take over our data from the world of common sense, in which we quite properly accept our normal phenomena as realities, and "tacitly assume that the world we know is the world as it really is—the world as known by everybody else." But the problem of metaphysic, ever since Kant took it in hand, is to analyse these very data. Nor does the addition of heredity and evolution make any difference. The experience of the race, like the experience of the individual, is a series of events taking place in the world of phenomena—the world which science assumes and philosophy tries to explain. Accordingly Mr. Spencer's procedure is characterized by Professor Watson as a "method of accounting for the intelligible world by ignoring intelligence." In a chapter on "The Distinction of Noumena and Phenomena in Kant and Spencer" Professor Watson enjoys the polemic luxury of making short work of the pseudo-Kantian fallacies about the Unknowable which Mr. Herbert Spencer in an evil hour adopted from Sir William Hamilton. In one sentence he puts the point in a nutshell:—"If every attempt to think 'being out of relation' results in failure, why not give up the attempt, and conclude that there is no 'being out of relation' to think?" Unfortunately the whole history of philosophy shows that the enterprise is a most alluring one to ambitious minds.

This and other remarks of Professor Watson's have already indicated the line he takes in criticizing Kant himself. Like Mr. Shadworth Hodgson, he considers that Kant, if thoroughly true to his own ideas, would have identified that which is real with that which is knowable, and made a clean sweep of things-in-themselves. The abolition of things-in-themselves entails many simplifications in the Kantian analysis. Time and space are no longer forms imposed upon, and in a manner veiling, things which have some kind of reality without them, but become "relatively abstract relations of the real world." The contrast maintained by Kant between perceptions and objects perceived vanishes in the same way, for there is no longer a crude matter of sense "given" to us by or out of an unknowable world. Again, the distinction of *a priori* and *a posteriori* elements loses its importance, and all real relations of things are seen to be equally necessary. Space fails us to do justice to this part of Professor Watson's work, but we cannot too strongly commend it to the limited number of readers who can relish well-sustained metaphysical argument.

#### THE PRIVATE SECRETARY.\*

*THE Private Secretary*, which appeared originally in *Blackwood's Magazine*, is published anonymously, nor does the author lay claim on the title-page to any previous works. Nevertheless, this very clever novel was evidently not written by a novice. In every chapter it bears the signs of practised skill and matured literary judgment. The style is clear and vigorous. Effective situations

are ingeniously devised to bring out in bold relief the characters who play the leading parts. The plot has been constructed with great care, and the increasing interest is sustained to the end. It strikes us that the author has borrowed his manner of treatment from the French school, and some of the most effective of his situations are questionable according to English notions; but he extricates himself from his self-imposed embarrassments with invariable tact and delicacy. He is a man of the world who indulges in *tours de force* in which inferior artists might undoubtedly be seriously compromised. And if he has formed himself to some extent after French models, he is no imitator or plagiarist. The novel is original from first to last; and in nothing is it more original than in the main idea which is expressed in the delusive title. We had imagined that the *Private Secretary* was probably an aspiring clerk from the Foreign Office, attached to the fortunes of some eminent statesman. We expected a tale of political intrigue, of social manoeuvring in high places, or perhaps of some sensational personal career which landed the hero in celebrity through a series of struggles and successes. The reality is as different as possible from any of our fancies; and we are as much taken aback in being presented to the heroine as was Mr. Robert Clifford, who is the hero of the novel, when he first made the acquaintance of Miss Hilda Reid. For the Secretary is a young and fascinating girl, who answers an advertisement of Clifford's when in search of a situation. But Clifford, as we see him, is the very man to be made the victim of a designing woman; and the question that naturally exercises us from the first is whether Hilda Reid is as single-minded as she appears to be. He is young, clever, and rich, but almost a recluse. Privately educated, and kept dawdling away his existence from year to year under the roof of the eccentric uncle who ultimately leaves him his property, Clifford enters on a London life with neither associates, knowledge of the world, nor experience. He wants occupation, and seeks it as a philanthropist, who is drifted about on generous impulses, and is perpetually changing his expensive hobbies. He occupies handsome chambers, and is waited upon by a respectable old housekeeper, with a female aide-de-camp. We may conceive how the feminine establishment is fluttered when the young and rather attractive Miss Reid is installed as secretary to their master. But Miss Reid's conduct is beyond reproach, and she shows herself subsequently as much a woman of business as in the preliminary interviews that led to her engagement. She keeps herself to her own place and her private room; meets her employer as man to man over the details of her daily tasks; and tacitly gives him to understand, like the virgin guest sent by the genii as instructress to the necromantic Baron in the German tale, that she will vanish at the first semblance of familiarity.

Whether Miss Reid is as prosaic and unsusceptible as she seems to be is for some time a secret between her and the author. As to Clifford's feelings we are not left so long in doubt, though naturally he endeavours to act the hypocrite with himself. It was by no means a case of love at first sight; for Hilda, though of fascinating appearance, seems hardly to have been strictly beautiful. And we should imagine that her manner was an additional safeguard to her, since it was so thoroughly self-possessed and businesslike as to be antipathetical to a grand passion. But Clifford, who has really nothing to do, although he manages to create a vast amount of business, necessarily lets his thoughts wander to the room where his pretty secretary sits almost within call. He makes errands to discuss some urgent detail; he stops his visits capriciously to see what may be the effect of his absence; but, all the same, he shows a thousand delicate attentions which assuredly would never have entered his head had the new secretary been "a great, lubberly boy." Hilda, who, as it happens, is unusually intelligent, must have been the dullest of girls had she not speedily perceived the interest she excited in her staid employer. The inevitable result follows. Clifford falls deeper and deeper in love; and Hilda, who thaws to him at last under the flattering warmth of his attentions, is persuaded to acknowledge that he is not indifferent to her. It must be added that he had given her unmistakable proofs of the ardour and sincerity of his attachment. It is not only that he showed himself extremely generous to her relatives when he had once discovered them, for a certain recklessness in money matters was of the essence of his impulsive nature. But he learned to tolerate as objectionable a pair of acquaintances as ever disenchanted a hesitating lover. There is no more amusing character in the volumes than the parent whom Hilda has the privilege of supporting. Captain Reid is a veteran who drapes himself with dignity in the memories of an imaginary past, who manages to preserve his self-respect by never admitting an obligation, and who, moreover, is a master in the art of writing begging appeals under plausible pretences of conferring a favour. He practises upon Clifford most inopportunely for Hilda. But Clifford forgives the father for the daughter's sake, and even, although with some amount of natural loathing, goes the length of extending a hand of friendly patronage to her slangy and selfish brother.

It is then that the author gives his story the delicate turn which reminds us of some of the most popular French authors. Hilda has owned her love, but Clifford too has an awkward confession to make. They may love if they please, but they cannot marry, unless, indeed, they are to begin the world again as paupers. It seems that Clifford had received his fortune under pain of forfeiture unless, in the event of his wedding at all, he consented to wed a cousin of his own, always supposing that young lady to be

\* *The Private Secretary*. London: Blackwood & Sons. 282s.

willing. Should he unite himself to anybody else, the property goes to Miss Blanche Scallan. And just as the term is approaching when the condition shall lapse should the Scallans not appear to claim its fulfilment, the Scallans arrive in London from America. They are of the type of showy American *parvenus*, who lavish the money that has been lightly come by, and who, though they are capitalists to-day, may be dollarless to-morrow. They are almost more ignorant of society in London than Clifford himself, and are fortunate in finding a gentleman willing to introduce them to it, in the person of the Honourable Captain Burrard. Clifford has been dazzled by his cousin's beauty and daunted by the marvellous Transatlantic self-possession which is in a very different style from that of Hilda. Having fixed his affections elsewhere, he has no desire to make Blanche's charms his own, and he soon begins to cherish the hope that she has as little fancy for the match as himself. Scallan appears to be enormously rich; Blanche is his only daughter; and the Honourable Captain Burrard, who becomes marked in his attentions, would in many respects be a far more eligible connexion. Unluckily Scallan is on the brink of ruin, and a rich settlement for his daughter is of the last consequence. Clifford sees that there is no honourable escape from his dilemma, so he decides at last on making dishonourable proposals to Hilda. He pleads the difficulties of his situation, somewhat exaggerating them; endeavours to justify an illicit connexion on the specious ground of necessity; and promises to do his utmost to make it as little painful as possible. Hilda's virtue is too strong to yield at the first assault. She admits a certain force in her lover's reasoning, but refuses characteristically. She does not indulge in an outbreak of high-flown indignation, and, indeed, we are given to understand that she is by no means a very religious young woman; she simply declines, and withdraws, for the time, from further temptation, by cutting the interview short. Afterwards, on reflection, and on seeing how wretched Clifford will be made by her decision, she reconsiders it and sends him a significant invitation to come to her. The pair leave for the Continent in company, where they are to live together under a feigned name. By one of the strangest of coincidences, whom should they meet on board the Channel packet but the Honourable Captain and Mrs. Burrard, starting on their wedding trip? The Captain had persuaded Miss Scallan to elope; and, had Clifford only been less impatient, he might have led his Hilda to the altar without insulting her purity or bringing a stain on her fame. As it is, he is not married, and Miss Scallan is; so the fortune he has clung to need never be forfeited. But he feels himself bound to shield, so far as he can, the reputation of the woman who has risked her good name for him. He impulsively assures Burrard that he is married, and consequently that he had married before his cousin; thereby preparing for himself much future trouble with claimants to his property, trustees, lawyers, &c., and introducing besides a series of the most ingenious complications in the story. Perhaps the most admirably managed of these is one in which he lays Hilda under a heavy load of imaginary gratitude for a chivalrous piece of self-sacrifice of which he never was guilty; and then, having accepted her gratitude on false pretences, has his secret betrayed, to the imperilling of their happiness. She forgives him, of course, and all ends happily. She lives rich and respected, even by the few who were necessarily admitted behind the scenes in the earlier acts of her love-drama. And moralists might say that her deliberate lapse from virtue deserved retribution in one form or another, and that her story should hardly be a case where "all's well that ends well."

#### THE SPEAKER'S COMMENTARY.

THIS very considerable and, on the whole, very creditable work is gradually approaching its completion. The instalment recently published contains all St. Paul's Epistles, from Romans to Philemon inclusively, leaving that to the Hebrews, of which the authorship is doubtful, and those of St. James, St. Peter, St. John, and St. Jude, together with the Apocalypse, for a final volume. We congratulate the able and learned editor of the whole series, Canon Cook of Exeter, on the successful progress of his arduous task. The faults as well as the merits of this *Commentary*, of which we have spoken on several former occasions, are as conspicuous in the volume now before us as in others of the long series to which it belongs. If, on the one hand, the several writers display sufficient knowledge, sound criticism, and indefatigable perseverance, on the other hand they are too studiously moderate in the views which they are allowed to express, and are nevertheless in too little accord with one another, for their joint work to be a really trustworthy guide to Biblical students. Too many hands have been engaged on the work, and the editor has not always been able to work up the contributions of writers of unequal acquirements and varying sympathies into a fairly harmonious whole.

Since we noticed the preceding volume of *The Speaker's Commentary*, which contained Dr. Westcott's most valuable and exhaustive annotations of the fourth Gospel, the Company of Revisers of the English New Testament appointed by Convocation

have given to the world their long-expected recension of the English text. We do not wonder that Canon Cook was at once surprised and annoyed to find that the Revisers had taken no notice whatever of their coadjutors, or rather predecessors, in the same field of criticism—the eminent divines who had been engaged on the four Evangelists and the Acts in this *Commentary*. This feeling was expressed by him at the time in a temperate letter. The omission of any such recognition is the more marked because, as may be seen on the title-page of the several volumes of *The Speaker's Commentary*, "a revision of the translation" was one of the special objects of the undertaking. We can only say that, while any lack of courtesy or of sympathy on the part of those engaged in a common work of this kind is deeply to be deplored, the scholars who are responsible for the amended translations of *The Speaker's Commentary* are, in our judgment, not a whit inferior to their Westminster rivals. And we have no doubt whatever that all the real benefits of a revised text, without any of the dangers likely to result from the unsettlement of men's minds about the general accuracy of the familiar Authorized Version, could have been obtained by all who cared to seek for them in the notes of *The Speaker's Commentary*. Above all, the innumerable tasteless alterations, in matters of no importance, which disfigure the Revised Version have no place in this scholar-like work. But all necessary corrections are made. And the general agreement between these corrections and the Revised Version is, we may add, in all respects satisfactory. We proceed to give some account of the volume now before us.

The first contributor is Dr. Gifford, who has supplied the general introduction, the commentary, and the critical notes on the Epistle to the Romans. We find his work, on the whole, meagre, dry, and unsympathetic, distinctly inferior, especially in respect of the drift and object of the Epistle, to Godet's treatment of the subject. But many points of detail are illustrated by him with sufficient learning. There is a careful note, for instance, on the word "Propitiation," or (as Dr. Gifford would read it) "Propitiatory," in Rom. iii. 25, which only wants some reference to the Christian altar, as representing to us what the *Capporeth* of the Holy of Holies typified to the Israelites, to make it thoroughly satisfactory. In Rom. xii. 8, "He that giveth, let him do it with simplicity," Dr. Gifford anticipated the Revised Version by translating the last word "liberality." Of the two Epistles to the Corinthians, the First has been assigned to Canon Evans, Professor of Greek in the University of Durham, and the Second to the Rev. Joseph Waite. We are much taken with the former. It is terse and abrupt in style, and full of humour and quaintness. If this commentator seems to take a keener interest in the language than in the matter of his subject, yet all that he says is worth hearing. His paraphrases, in particular, are often very instructive. Very happy is his note on 1 Cor. xi. 10, about "the woman having power on her head"—a veil, that is, as a sign of her subjection. Mr. Evans quotes in illustration the line from *Macbeth*, "Present him eminence both with eye and tongue." We turned to 1 Cor. ii. 9 to see if any explanation was offered of St. Paul's presumed quotation from Isaiah of the beautiful passage, "Eye hath not seen, nor ear heard . . . the things which God hath prepared for them that love Him." Mr. Evans does not notice the fact that only the idea, but not the exact words, can be found in the prophet. But the very words are embedded in the most ancient Greek Liturgy; whence some have not unreasonably thought that St. Paul was really making the citation from a liturgical formula, which would thus be shown to be actually of apostolic date. In 1 Cor. xiv. 10, Mr. Evans would read, with the margin (but not the text) of the Revised Version, "Nothing is voiceless," instead of "None is without signification." The commentator's note on this passage, too long unfortunately to be quoted, is a typical example of his matter and style. In the same chapter the insertion of the definite article, "*The Amen*" (adopted also in the Revised Version), very much emphasizes the fact that the Christian Church, following the Jewish custom, had from the very first adopted the practice of concluding the public prayers with this response. The great Fifteenth Chapter of this Epistle, on the Resurrection of the body, is prefaced by a most valuable and eloquent introduction. We quote one passage from it of much interest:—

No doubt from v. 22 to v. 29 we have the contents of one of St. Paul's superabundant revelations disclosing to our view a dim perspective of long *Æonian* reaches, extending from our Lord's Resurrection to His *Parousia*, and stretching away beyond the *Parousia* over a period of conflict with spiritual principalities and dominions, which results in their complete subjugation and then ushers in the *telos* or end. In a few touches the prophet presents to the gaze of the Church outlines rising beyond outlines of a stupendous future—a vast stretch, and no more, that may be filled up in detail only when the *Parousia* shall belong to the Past, and the *then* of apostolic presentiment shall become the *now* of Christian experience.

Mr. Evans does not call attention to the rudimentary Creed which is to be found in vv. 3 and 4 of this same chapter. He throws much light on the difficult passage, "What shall they do that are baptized for the dead," by the argument that the preposition *ὕπέρ* does not merely mean, as is commonly supposed, "in behalf of," or "for the benefit of," or "in the place of," but rather "with respect to," or "with an eye upon," or "with the mind over"—in other words, "in relation to"; implying that the only idea of the vexed passage is that baptism has a direct relation to the resurrection of the dead. This is very ably discussed in a long additional note, in which this sense of the preposition is shown to be common in the Greek Fathers; and the same elliptical use of "for" is paralleled from Shakspeare. "To such lengths,"

\* *The Holy Bible, according to the Authorized Version (1611); with an Explanatory and Critical Commentary, and a Revision of the Translation by Bishops and other Clergy of the Anglican Church.* Edited by F. C. Cook, M.A., Canon of Exeter. *New Testament*, Vol. III. (pp. 884), Romans to Philemon. London: John Murray. 1881.

says Mr. Evans, "has this prepositional error led recent commentators, that actually they seem to see lurking in the folds of this text, which their own perplexities have made a mazy labyrinth (see in *loco* Alford's note of bewilderment and Stanley's prodigious inferences), a veritable Minotaur in the shape of vicarious baptism."

The Dean of Chester is responsible, next in order, for the Epistle to the Galatians. His notes are, as a rule, flat and insipid in comparison with those of the lively Durham professor. We turned with some curiosity to his commentary on that most perplexing verse (Gal. iii. 20), "Now a mediator is not a mediator of one, but God is one," only to be disappointed. There are said to be two or three hundred interpretations of this passage, the difficulty of which lies of course in the doubt as to the meaning of the word "one" in the two clauses. Dean Howson borrows from an unpublished sermon of Canon Evans the assertion that here "the word *one* clearly points not to *number*, but *quality*"; and this is the key to his interpretation. But an ordinary reader seeking for guidance will profit very little by this disquisition. We find the Dean of Chester, in his note on Gal. iii. 27, half-inclined, as it seems to us, to disparage Luther's high view of the baptismal sacrament. We note with greater approval that on Gal. vi. 6 he argues from the phrases "he that is taught" and "him that teacheth" that catechizing—oral instruction in religious doctrine—has been an ordinance of the Church from Apostolic days. It is a happy suggestion, on Gal. iv. 13, that the "infirmary of the flesh" mentioned by the Apostle refers to a special experience of his "thorn in the flesh," and that the companionship of St. Luke "the physician" was due in some measure to St. Paul's constant need of medical help.

The Epistle to the Ephesians has been entrusted to the Rev. Frederick Meyrick. We are glad to see that he has the courage to argue that the quotation (in Ephes. v. 14) "Awake thou that sleepest" is from a Liturgical hymn, as Theodoret was the first to point out. The quotation is introduced by the words "*He saith*," which is not altered, as it might well have been, by the Revisers into the more general phrase "*It saith*." How is it that Mr. Meyrick, writing on Ephes. i. 13 and iv. 30, does not tell his readers that the "seal of the Lord" means Confirmation? Any acquaintance with the Office Books of the Greek Church would have reminded him of this. Mr. Waite, on 2 Cor. i. 22, is equally at sea on the matter.

The Dean of Raphoe, Dr. Gwynne, follows with the Epistle to the Philippians. We think highly of his critical and exegetical skill. He is remarkable, too, for most extensive and varied reading. In his introduction, for example, we find him quoting a despatch of Lord Salisbury's after the Congress of Berlin, in order to show the importance even in our own days of *Canalia* (the ancient Neapolis), the seaport of Philippi, where St. Paul must have landed. He cites also Lord Macaulay from the *Edinburgh Review*, and even borrows illustrations from the Offices of the Church of Sarum. Dr. Jeremie, the late Dean of Lincoln, had left, it seems, some notes on this Epistle, which are mostly given with the initial "J" subscribed. They are, however, worth but little, and need scarcely have been printed. We are glad to see Dean Gwynne making constant references to a most valuable specimen of modern Cambridge scholarship, Mr. Swete's edition of the commentaries of Theodore of Mopsuestia. Is there not, we may ask, much to be said for considering the phrase "your messenger" (*ait*, "apostle") as applied to Epaphroditus, in Phil. ii. 25, to imply that he was the Bishop of Philippi? This was Theodoret's opinion, and few ancient commentators surpass that Father in accuracy and sound judgment. So, too, Luther of old, and Bishop Lightfoot in our own times, have concluded as to the ecclesiastical rank of Epaphroditus from the fact that in Phil. iv. 3 St. Paul calls him his "true yokefellow."

We come now to what is by far the most brilliant section of the volume before us. The Epistle to the Colossians, the two Epistles to the Thessalonians, and the short Epistle to Philemon, have all been annotated by the Bishop of Derry. The introduction to the first-named Epistle is a singularly beautiful and poetical disquisition, sound in its theology, animated in style, and bearing marks of the most wide and varied culture. We may note in particular a reference to the singularly interesting Christian churches still remaining in Thessalonica, some of them now used as mosques. The Bishop's authority in this matter is, however, only Sir George Bowen's *Mount Athos, Thessaly, and Epirus*. He does not seem to have made acquaintance with M. Texier's splendid volume on the Churches of Thessalonica, edited by Mr. Pullan. Turning from architecture to music, we find an admirable additional note on the "psalms and hymns and spiritual songs" of Col. iii. 16. The Bishop here pleads earnestly for the artistic excellence of the Church's song in public worship. He contends that the Apostle's phrase "singing with grace" means "gracefully," or with sweetness and beauty. It is the less surprising to find him, as being a hymnologist himself, quoting, on Col. i. 18, the Septuagesima hymn of the Ancient Latin Church for the sake of its theology. Unlike some of his coadjutors, the Bishop of Derry never fails to give a plain and sound exposition of difficult passages. Nothing, for instance, could be better than his notes on "the first-born of every creature" (Col. i. 15), as against any Arian or Socinian exposition of the phrase. Again, he anticipated the Revisers in omitting the words "of the Father," and reading, with Bishop Lightfoot, "the mystery of God, even Christ," in Col. ii. 2. This rendering, we need not say, connects the word *Christ* to be in apposition grammatically with *mystery*. Bishop

Wordsworth had adopted a less satisfactory rendering—"the mystery of God, Christ." Bishop Alexander has found in the exquisitely pathetic and beautiful Epistle to Philemon a most congenial subject. His whole treatment of this epistolary masterpiece is admirable. He has spared no pains in his task, which has evidently been a labour of love. Every collateral suggestion bearing on the Epistle is thoroughly discussed and examined. We may specify, as remarkable for its force and eloquence, his description in the introductory observations of the horrors of Roman slavery. There is an instructive plea for the existence of material churches even in the earliest Apostolic times, suggested by the phrase "the Church which is in thy house." We note here, however, that the general editor has not remembered that, while the Bishop of Derry translates *ἐν τῷ οἴκῳ*, in Acts ii. 1 and 44, "to the same place," Canon Evans in this same volume denies any local meaning to the phrase in that passage, which he explains as meaning there "for the same purpose."

It only remains to say that the three Pastoral Epistles, to Timothy and Titus, are briefly annotated by the Bishop of London, while an excellent general introduction is provided to them by Professor Wace. The Bishop, we observe, dwells strongly on the spiritual graces, the *charismata*, of Holy Orders. He considers "the laying on of hands" of Heb. vi. 1 to mean ordination. But surely the context of that passage, in which laying on of hands is connected with baptism, and in which both ordinances are reckoned among "the principles of the doctrine of Christ," points to Confirmation rather than to Ordination as having been in the Apostle's mind at that time.

The volume of *The Speaker's Commentary* which we have now noticed is undoubtedly a most valuable addition to the series. We could have wished, indeed, that there had been more unity of view and more equality of critical power among the several contributors. But, at any rate, this important *Commentary* improves, rather than deteriorates, as it approaches its completion.

#### THE CANNIBAL ISLANDS.\*

THE recent visit of the King of the Sandwich Islands to this country makes any work which throws light upon the people and geography of the Pacific Islands welcome at the present moment. The great interest shown for, and the cordial reception given to, one whose predecessors were but a few years ago nothing better than petty chiefs of barbarous cannibal tribes may appear at first sight to be due only to good-natured curiosity, but it has really a certain political significance. The cutting through of the Isthmus of Darien is now only a question of time, and when that work is accomplished the strategic and commercial advantages of the Pacific Islands will become a matter of serious concern both to Europe and America. There can be no necessity to conciliate, from a diplomatic point of view, the petty potentates themselves, but the mere existence of friendly relations with them may hereafter exercise a beneficial influence in preventing possible rivalries and jealousies on the part of greater Powers.

The volumes before us give a graphic account of one of the best known of these groups of islands, in the form of letters written to friends at home. Although this style of composition is generally rather wanting in literary finish, it has its advantages in presenting fresh and graphic pictures of the scenes and life described. The domestic arrangements for an English family in Fiji are not all that can be desired. At Levuka everything is dear and bad, but the servants are the worst of all—they are even a greater plague than the race at home. Looking very intelligent, they prove utterly stupid, neglect their work the moment their employer's back is turned, and, though "indifferent honest," cannot resist the temptation to steal towels and handkerchiefs for articles of attire. As it would be perfectly proper for them to use things belonging to their own chiefs nothing must be said to them, but the practice is, we should imagine, rather inconvenient.

The strange lack of lower animal life is one of the most remarkable peculiarities of these islands, and accounts in a great degree for the cannibalism that was formerly so prevalent there. There were no indigenous four-footed creatures but rats and flying foxes, and even the pigs which now run wild in some of the jungles were brought there by the Tongans, who also introduced cats, ducks, and fowls. The names of the other animals, *seepi* (mutton), *goti* (goat), *bullama kow* (beef), are sufficiently indicative of their origin. Venomous reptiles are fortunately unknown, but a trap for the unwary exists in the tree-nettle, a large forest tree of magnificent foliage, the leaves of which when touched administer a sting, the burning anguish of which endures for days. The *kaukaro*, or itch plant, is another strange and dangerous growth:—

Instances have occurred [says the author] when a man, having ignorantly selected this wood, either as timber from which to fashion his canoe, or a spar suitable for his mast, and incautiously sitting on the wood while carpentering, has discovered when too late that the subtle poison had entered by every pore, and that his whole body was rapidly breaking out into angry spots, causing an irritation utterly unbearable and lasting for months, sometimes years.

The *yangona* root, elsewhere in Polynesia called *kava*, is the only stimulant the islands possess. It is prepared by chewing, and, though not pleasant to the taste, is much sought after, as its effects are peculiarly exhilarating and refreshing. Drunkenness from its

\* *At Home in Fiji*. By C. F. Gordon Cumming. London: Blackwood & Sons, 1881.

use does not affect the brain, but paralyzes the muscles, so that a man lies helpless on the ground perfectly aware of all that is going on around him.

The glimpses which the author gives us of the religion and beliefs of the Fiji Islanders are interesting, and possess considerable value as contributions to comparative mythology. The Kai Tholos (or Highlanders), for instance, have many legends and fairy tales which bear a strange resemblance to those of Northern popular mythology. Thus the pine forests are haunted by tiny men, called *Vele*, with high conical heads; they carry clubs, which they throw at all trespassers, who go mad in consequence. A fern leaf carried in the hand is, however, sufficient to ward off the evil influence. The Fijian, in fact, peoples every remarkable spot, whether grove, dell, cave, or rock, with invisible beings, whom he fears and propitiates with offerings. Such a being exactly corresponds to the *genius loci* of the ancient Romans and the jinn or genie of the Arabs, familiar to us through the *Arabian Nights*; and the existence of the superstition shows how prone the human mind is in its infancy to adopt the same ideas all over the world. It is curious also to note the constant recurrence of tree and rock worship amongst primitive and savage tribes. The pagan races of Palestine and Syria had their sacred groves and stones to which divine honours were paid; and even now the peasants of the Holy Land and the Desert Arabs have their sacred trees and holy rocks. In Fiji we meet with the same thing, although the sacrificial customs of the Cannibal Islanders were even far greater abominations than were the unholy rites of Baal:—

The mission station in Bau must have been indeed a hateful home in those days, when you could not look down from the windows to the town below without witnessing scenes of unspeakable horror, the very thought of which is appalling; when the soil was saturated with blood and the ovens were never cool, by reason of the multitude of human victims continually brought to replenish them. Now the site of the ovens is marked only by greener grass; but an old tree close by is covered, branch and stem, with notches, each one of which is a record of some poor wretch whose skull was dashed against a stone at the temple, the foundations of which are still to be seen a few steps further on. The tree is the sole survivor of a sacred grove which, like that at Rewa, was cut down on account of the superstitious reverence attaching to it.

The religion of Fiji was intimately connected with its rather peculiar gastronomy, and the human victims sacrificed to an idol or devil were invariably eaten. No important ceremony of any kind could, indeed, be performed without this horrid accompaniment, and the records of the earlier missionaries who were eyewitnesses of these atrocities reveal an amount of inhumanity and savagery that is almost incredible. We read, for instance, in an account of the town of Rewa—

Jackson (an Englishman who, thirty years ago, was detained amongst these people for two years) relates an incident of peculiar interest, as an illustration of sacrifice to the earth spirits—a custom which British antiquarians tell us was formerly practised by our pagan ancestors, and of which traces have till very recently lingered among us. A new house was about to be built for the chief, Tui Dreketi, and the people assembled from all tributary villages to bring their offerings and dance and make merry. A series of large holes were dug to receive the main posts of the house; and as soon as these were reared, a number of wretched men were led to the spot, and one was compelled to descend into each hole and therein stand upright with his arms clasped round the pole. The earth was then filled in, and the miserable victims were thus buried alive, deriving what comfort they might from the belief that the task assigned them was one of much honour, as ensuring stability to the chief's house. The same idea prevailed with respect to launching a chief's canoe, when the bodies of living men were substituted for ordinary rollers—a scene which Jackson also witnessed, and quotes to prove how cruelly the tributary tribes were treated by these Rewa chiefs, one of whom he accompanied to a neighbouring isle. They came to a place called Na-ara-Bale (meaning "to drag over," literally corresponding to our own Tarbert), a low, narrow isthmus joining two islands together. By dragging the canoes across this half mile of dry land, they were saved a long row round the island. On landing they found the villagers entertaining the people of another village which had fallen under the displeasure of Rewa, and at the bidding of the chief these people allowed their guests to be surprised in the night, when forty were captured, and each being bound hand and foot to the stems of banana trees, were then laid as rollers, face uppermost, along the path by which the canoes were to be dragged across the isthmus. The shrieks of the victims were drowned by the howling songs of their captors, and, with one exception, all were crushed to death. One poor wretch lingered awhile in torture till the ovens were made ready in which all were cooked, the guests of the previous day affording the feast for this.

Only those who had been killed were considered good for food, but the Fijians had right royal banquets whenever a battle had taken place. Thus, in Namena, in the year 1851, fifty bodies were cooked for one feast; and when the people of Bau were at war with Verata, they carried off 260 bodies, seventeen of which they sent to Rewa just as presents of game are sent out after a battue here. A wooden fork was made use of in eating human flesh, as it was supposed to cause a skin disease. One of these instruments is figured on the cover of the work. The custom of public dinners on a large scale has survived the heathendom of the place, and is as much a public institution in Fiji as it is in the city of London. At a great meeting of chiefs at Bau, in January 1880, on the return of Sir Arthur Gordon to England, the menu included 104 pigs and a large shark roasted whole, the latter being a substitute for the *bakula* or human meat of cannibal days. The taste for the latter delicacy still survives, and one young chief, being asked by Miss Gordon Cumming whether the manner of preparing human flesh was not different from that in which pork was cooked, misunderstood the question, and answered with suspiciousunction, "Oh! there's no comparison between them—human flesh is so much the best."

But the tales of earlier cannibalism are not the only horrors which mar these otherwise pleasant pages. The islands were visited

with an epidemic of measles, which proved as dreadful a scourge as any recorded plague of Europe or the East. This sad event marked the beginning of the British rule. The old King, after ceding the islands, went to Sydney to pay his respects to Sir Hercules Robinson, and there caught measles. The disease spread rapidly, and, owing partly to the impossibility of isolating the patients or adopting any sanitary measures whatever, it developed into so terrible a plague that in a short space of time one-third of the whole population died. A war with some revolted tribes also varied the monotony of the author's stay in the islands, and the English officers had several opportunities of establishing the fact that cannibalism has not yet quite died out.
